Ourselves

WE owe our readers and advertisers a word of explanation for the new format of the *Journal.* The enforcement by the Government of India, of the Paper Control (Economy) Order, 1944, has meant such a drastic cut in our normal paper consumption that it would have been impossible for us to accommodate all our advertisers or even a good number of them if we had retained the old format of the *Journal.* Faced with the alternatives of either temporarily reducing the format of the *Journal* and continuing to give all our advertisers the same service as before, on the one hand, and retaining the old format of the *Journal* and depriving many of our advertisers of their only effective medium of publicity, on the other, we have made the obvious choice. Trade and Technical Journals in England and elsewhere have also done much the same thing and are none the worse for it. On the other hand, the new format of the *Journal* should make it easier to handle than before without at the same time losing much of its potentialities for display and advertisement purposes. The editorial pages, too, should not by any means be affected by this change in format. A clause in the Paper Control (Economy) Order ensures that the reader gets more reading matter than ever before, while we should find it possible not only to maintain but also to increase the reader interest by publishing articles and news of a more varied nature.

Future of Control

THE way in which the Department of Industries and Civil Supplies, Government of India, has fought inflation in India through its control of industry provides instructive reading. At the outset the new Department had to organize increased supplies of civilian goods, including textiles, for civilian consumption through increased local production and, where necessary, imports, and through releasing stocks surplus to the needs of the Supply Department. It had to break the racket of the hoarder and the profiteer, counter black market activities and make available to consumers as much goods as possible at reasonable prices. For achieving these results it had, of course, to control production, distribution and prices, in which task it has had the valuable co-operation of advisory bodies representing the interests concerned, e.g., the Textile Control Board. To-day the supply and price positions of cotton textiles are far better than they were in the beginning of 1943. From a pre-war average production of 3,600 million yards it has been stepped up to 4,800 million yards and it was expected that handlooms would account for another 2,000 million yards. Out of the total, however, exports and Defence services require 1,200 million yards, leaving a balance of 5,600 million yards as against 6,400 million yards before the war. So far as the ceilings are concerned, we have reason to believe that they have been scrupulously observed by the mills in general. The industry has had to sacrifice the profits arising from inflated times, to carry out Defence orders, to supply the needs of the country as well as of export markets, all at the cost of over-worked machinery.

It is well to bear in mind, however, that equal success has not been evident in the matter of distribution which, in spite of all that the control authorities are doing, continues to be a baffling problem. While it may be readily conceded that the various bottlenecks in distribution and resultant scarcity are to a great extent due to the reprehensible activities of a few, it cannot be denied that transport difficulties, too, have had their fair share in impeding the progress of distribution. Inherent defects in the quota system itself have come to the surface and, while the different centres may have been obtaining more or less the volume of goods allotted to them, several have not been able to obtain the special types of goods in demand in their particular territories. Further, the quota-holders themselves are suspected of forming rings to withhold stocks and of adopting other questionable practices. We hope, however, that the authorities who have brought control to its present stage of development will continue to bend all their efforts towards bringing under the law any section of the community, however numerous or influential, which threatens to thwart it.

What, however, is the future of control? " It is fairly clear," said the Textile Commissioner the other day, "that even if the war were to end in the near future the demand for cloth throughout the world will be so great that in the interests of the people of the country, if for nothing else, control in some shape or form over the manufacture and distribution of cloth will be necessary for a long period after the war." The present control measures may, therefore, continue until the chances of hoarding, profiteering and other unsocial activities are reduced to *nil.* Even in the long run control would seem to have a special role to play in the world. Already the relative merits of State control and private enterprise are being hotly debated and, as public opinion in America shows, if the current trends are against complete State control, they are no less so against unrestricted private enterprise. The advocates of State control and private enterprise both have equally plausible arguments to support their respective cases, but the choice would seem to lie between the two extremes, for there can be really no conflict between the State and private enterprise. As Sir Stafford Cripps pointed out recently, " it is not a true appreciation of the situation to imagine that we must either nationalize all our industries or leave them all under uncontrolled private enterprise." Effective control should always help to make the most of our man-power and material resources. The aim of such control should be to " serve private enterprise, not to strangle it ; to direct initiative, not to discourage it ; to control the nation's resources, not to corner them ; to protect the consumer, not to penalize the producer ; to safeguard the public by the control of investments, not to prohibit the pioneer spirit ; to control and co-ordinate research ; to give proper weight to capital, labour and consumer interests ; to secure the greatest good of the greatest number, not to stamp out the few who make that good available to the many."

University Degree in Textile Manufactures

IN commenting last month on the 15-year plan of the Government of Bombay we referred but casually to the proposal to institute a degree course in textile manufactures at the Victoria Jubilee Technical Institute as a post-war measure. It is a happy circumstance that in this issue, which marks the commencement of the fifty-fifth year of the *Journal*, we should be able to dwell on the subject at more length. The need for higher technological education, with special reference to the textile industry, has always been strongly urged in the pages of this *Journal* and it is therefore matter for gratification that a definite announcement has at long last been made. The subject, on the other hand, has been exercising the minds of the authorities for quite some time now. When the V. J. T. Institute celebrated its Golden Jubilee in 1938, the trustees expressed the hope of introducing a new course " which will prepare students for the degree standard and to develop the Institute on the lines of the Manchester College of Technology without, however, any duplication of the work that is being carried on at the Bombay University's Department of Chemical Technology, or without interfering in any way with the existing diploma courses at the Institute itself. " The Department of Chemical Technology has all but fulfilled the expectations raised at its inauguration of its becoming in due course a full-fledged college of technology. Writing at the time of the Golden Jubilee of the V. J. T. Institute we strongly supported Sir Ness Wadia's suggestion that a well-constituted institution should be formed in which the V. J. T. Institute, the Technological Laboratory of the I.C.C.C. and the Department of

Chemical Technology should co-operate, and that the last mentioned institution should make a beginning by constructing its own building in Matunga ; this has since been done and the Department is now housed in its own premises. At the same time strenuous efforts were being made at the V. J. T. Institute to introduce improved equipment and staff, and to raise the level of the instruction imparted to the degree standard, in order to enable students to take up administrative and executive posts in mills without their having to go abroad for higher study and training. It was only in July last that we published an authoritative outline of a course of studies for the education of the technical executives in textile mills.* It was there stated that the authorities of the V. J. T. Institute had prepared a course in textile manufactures leading to the University degree and that it was expected that the Institute would be able to put the scheme into effect in a short time. It is understood that the Government of Bombay have tentatively agreed to make a non-recurring grant for the purchase of the necessary equipment and a recurring grant for the provision of additional staff. If the shifting of the Department of Chemical Technology into its own building in Matunga was the first step in the integration and co-ordination of the available educational and research facilities, the institution of a degree course in the V. J. T. Institute may well be considered the second step.

Obviously, therefore, the institution of degree courses in textile manufactures has been long overdue. The textile industry is by far the largest industry in this country and it has been an anomaly in the development of technical education in India that so far no provision was made for imparting the highest type of education in this branch of technology. The decision of the Government of Bombay is, therefore, very opportune, since the textile industry will in the future face new technical problems arising out of the various demands that will be made on it during the post-war period. In this connection the remarks made by Sir Victor Sassoon while opening the first All-India Textile Conference come back to our mind. He said : " Bombay, particularly, must in the post-war years depend more than ever on maintaining an export market. But this cannot be done if care is not taken to see that first-class goods leave this country made under first-class conditions and made at prices competitive with those anywhere in the world."

We understand that the authorities of the V. J. T. Institute have already gone into the question of the duration of the courses of study and the curriculum for the proposed degree, and these will no doubt be further scrutinized by the appropriate university authorities. We have therefore no desire to go into the question at this stage beyond making a few general observations. The degree courses aim at imparting education and giving training which will qualify the students to occupy executive posts in the industry. Apart from the technical knowledge with which he will necessarily be equipped for performing successfully the duties relating to process work and maintenance of plant at its highest efficiency, an executive must possess other essential qualities such as initiative, resourcefulness, vigour and power of leadership. It has been the experience of educationists abroad that such qualities can be developed and fostered by suitable training and the potential manager can be given an opportunity to develop his powers during the formative period of his life. We feel that the experience gained in this direction by educational institutions abroad could be utilized with great advantage while framing the courses for the proposed degree. It has been often stated that our educational system is examination-ridden and yet no effort has so far been made to minimize the importance of examinations. We feel, therefore, that whenever new degrees are instituted an effort should be made in this direction and, as the V. J. T. Institute will be, at any rate for some time to come, the only place where courses for this degree will be offered, this opportunity could be well utilized for making the technical students at the university realize the importance of systematic and regular work throughout the course of training rather than a concentrated " swot " at

---

*See the *Indian Textile Journal*, July 1944, p. 401 ; " Technical Education in Relation to the Textile Industry," by Mr. P. N. Joshi, Principal, V. J. T. Institute, Bombay.

the approach of the examination. In all technical courses there should be greater emphasis on education and training in both the class-rooms and the laboratories and workshops, and the assessment of the students' ability should be determined by the work he has done during the year rather than by his ability to show a creditable performance in examinations by "swotting" lecture notes and the facts and formulæ available in text books.

The scheme for the institution of degree courses, when completed, will make available to the textile department of the Institute a complete, modern, full-size spinning plant comprising several latest types of carding, drawing and spinning machines for coarse, medium and fine counts. The spinning plant will include various systems of high draft on speed frames and spinning frames, complete plant for combing, variable speed spinning system, etc. A modern cotton waste plant is also included in the scheme. A complete weaving equipment comprising different modern systems of yarn winding, warping, sizing and doubling, and looms of the latest type of weaving, plain dobby and most complex jacquard fabrics, will be provided for imparting instruction of a very high standard. The processes on the machine will be carried out under controlled conditions of atmospheric temperature and humidity. Facilities for training in dyeing, bleaching and finishing, in textile physics and general engineering have also been provided for, while the qualifications and experience of the present head of the Department should prove helpful for its enlarged functions under a degree course.

Government have thus shown their very keen interest in the requirements of the needs of the textile industry in the post-war period and we feel that it is now for the industry to come forward with liberal donations for providing further facilities in the Institute for post-graduate work and fundamental and industrial research in the technical problems of the textile industries. The V. J. T. Institute has already rendered unique service to the development of industry in India and holds the premier position among technical institutions owing to the practical sagacity and untiring efforts of a succession of trustees who were able to win the confidence and, therefore, the benevolence of a large number of public-spirited citizens as well as the sympathetic co-operation and support of Government.

The Millowners' Association, Bombay, recently demonstrated their keen interest in technological education by their liberal donation to the University of Bombay. That donation will be utilized for research in the dyeing, bleaching and finishing of fabrics. Research in fibre properties, in factors affecting yarn and thread structures, and in the design and performance of textile machinery, will have to be fostered and encouraged to keep our textile industry at a high level of efficiency, and there can be no better institution for the purpose in view than the V. J. T. Institute. When the Institute was transferred from Byculla to Matunga the Millowners' Association subscribed Rs. 1,04,500, collected from members, to enable it to move into the new premises. Besides, the Association gave during the first 50 years of the Institute's existence, a munificent donation of Rs. 1,10,000 by annual subscriptions. We hope, therefore, that the millowners and other industrialists will once again come forward, jointly and severally, with handsome contributions to the Institute's funds and identify themselves with the cause of higher technological education and research that is so vital to the prosperity of the textile industry in India.

This issue marks the commencement of the 55th year of publication of the INDIAN TEXTILE JOURNAL.

Owing to paper shortage and the limitations imposed by the Paper Control (Economy) Order, 1944, the *Journal* will appear in its present reduced size and format until further notice.

Evolution of Social Insurance in India

Some Practical Suggestions

By A. N. AGARWALA, *Lecturer, University of Allahabad*

(*Specially Contributed*)

THAT the Government of India in the Labour Department have firmly resolved at long last to come to grips with the longstanding problem of the introduction of social insurance in this country is a matter of great satisfaction. It would be recalled that the Second (1943) Plenary Conference adopted a resolution that the Government of India should appoint a committee to prepare a scheme for the establishment of social security in India by providing for insurance against old age, unemployment, etc.; and the Fourth Conference of Labour Ministers blessed this resolution and themselves resolved that "with a view to provide adequate materials on which to plan a policy of social security for labour, the Central Government . . . should immediately set up machinery to investigate questions of wages and earnings, employment and housing and social conditions generally, and that as soon as possible after receipt of the required statistics and other data, the Central Government should appoint a mixed committee to formulate plans of social security." In pursuance of this resolution the Government of India appointed on 12th February 1944, the Labour Investigation Committee under the chairmanship of Mr. D. V. Rege, I.C.S., and consisting of Messrs. S. R. Deshpande, B. P. Adarkar and Ahmad Mukhtar as members. This committee is now busy in its exacting deliberations.

This is, no doubt, an excellent beginning; and if the work of the Labour Department in the recent past is any criterion, we should soon expect substantial results. The present, as such, is an opportune moment when some hard thinking is called for on the vital issue of the form that the evolution of social insurance should assume in our country. Here, the time factor and stagification in evolution are of the essence.

Practice in the United Kingdom

There can be no two opinions on the point that it would be irrational and wasteful for us to adopt the process of evolution followed by other countries or to start without an established plan in this regard. In the United Kingdom and other countries, the different branches of social insurance came into existence in a most haphazard manner and without any deliberate system or co-ordination and they can best be regarded as historical accidents. As need was felt or circumstances became favourable for one branch or the other, it was adopted as an individual whole, without keeping an eye on the older branches and their nature and intimacy or giving thought to the branches which might have to be brought into being later. Such an individualistic, uncoordinated and unsystematic growth is bound to possess many drawbacks which are fully rampant in Western countries. A close study of the Beveridge Report, for instance, reveals that the British system of social insurance at present possesses many fundamental deficiencies and drawbacks despite the fact that it is better than any other like system in the world; and Sir William proposes to remove these shortcomings by bringing about proper unification and co-ordination in its various limbs. A major defect of the British and other systems is the existence of a variety of administrative organs which operate quite separately and independently in their own peculiar ways, with the result that, besides other disadvantages, the cost in terms of money and trouble is much more than what it would be otherwise. Then, again, it is paradoxical that for risks and events which are in no way materially different from each other, there are different contribution conditions and benefits, which is directly ascribable to absence of unification. The income needs of a man who falls sick are in no way different from his income needs when he is thrown out of employment; but in the two cases in Britain, he would get different benefits, which does not make sense. It is a truism to state that piecemeal solution often leads to frittering away of financial resources and duplication in a variety of ways, which should be rigidly avoided in every sane and logical system. An ununified system is, again, the battleground of much avoidable litigation and bickerings in which one branch tries to shift the claim on to another branch, and the whole affair calls for constant vigil on the part of the inspectorate and the executive, and bulky and numerous case-laws and frequent amendments. Such a system is sure to make the beneficiaries subject to great difficulties, if not actually hardships. In order to keep our social insurance system free from these and other like shortcomings, it is necessary that it should be made unified and co-ordinated right from the start. It would be irrational and wasteful to ape the foreign pattern of growth to the extent of borrowing even their defects, drawbacks and shortcomings; and on the grounds of lack of finances, unsuitability of time and unpreparedness for social insurance, to create patches rather than parts of a systematic whole. What was historical necessity abroad must not be followed by choice in this country. On the other hand, we must make every effort to learn from and profit by their experience. Expert opinion has come to veer round to the truth that a system of social insurance brought into being by a process of haphazard growth has nothing to commend itself, and authorities like Sir William Beveridge, Joseph L. Cohen and others are one in advocating a unified system of social insurance which should as well be our ideal and aim. A properly unified system alone can bring in that rationality and sanity, and a square deal between the insured *inter se* and between one risk and another, without which a system of social insurance must ever remain an anomaly and conundrum.

Conditions in India

We must not be understood to suggest that we will have to implement, in case we must adopt the principle of unification, a full-blooded and full-fledged social insurance scheme in this country all at once, in all its forms and manifestations. This we simply cannot do. We cannot build Rome in a day. Our resources will not be equal to the task. Our Governments, which have been consistently starving all the nation-building activities so chronically, would not be able to subsidize the entire scheme to-day. Our workers, groaning under the crushing burden of unpaid and outstanding items of expenditure, might not be in a position to contribute in respect of provision against all the disabilities like sickness, unemployment, accident, old age, etc. Our employers may similarly be unable to contribute adequately, within the limits imposed upon their paying capacity by competition from foreign sources as a result of the pregnability of the constitution, in respect of all these schemes of social insurance under the existing circumstances or those expected in the wake of peace. If social insurance is nothing more than a redistribution of a fraction of our income in a particular manner, it is logical to understand that unless the aggregate income, of which the fraction is to be thus redistributed, is so large as to allow adequate provision of the sort which is intended and desired in the shape of social insurance, it would be fruitless to set up the latter, for it simply cannot be afforded. The tripartite contributory system cannot be expected to work if it is channelled and canalized to the confluence of all the branches rather than to each tributary separately and at different period points. We must candidly realize that we cannot adopt the whole of the social insurance system in one attempt under the existing circumstances.

We of course presume, while making the above statement, that the social insurance system might have to work without the framework of a planned economy. At present we do not have an economic plan working in this country; but in case one is adopted and worked up in the near future, it would certainly be so framed as to make generous provision for the introduction of a complete system of social insurance which might act as a bulwark to the standard of living of the people that would not be allowed to drop below a certain minimum level. Increase in national dividend and *per capita* income would then make such a plan not only possible but also feasible. But as we are not very sanguine about its advent in the near future, it would be extravagant to begin building castles in the air and aspire for a complete social insurance system in the near future. There is at least something in the employers' opposition to a sudden introduction of the entire system, which deserves serious thought. If the employers are made to pay in respect of all the branches of social insurances without at the same time adopting an economic plan, their cost of production would undoubtedly rise, and that in a world where economic penetration is taking an aggressive turn and foreign countries are adopting all means, fair and unfair, of lowering their prices in Indian markets with a view to underselling Indians—a process which seems to have already started. It is, no doubt, true that social insurance would benefit the employers as well, and they would reap all the advantages that flow out of stability of employment and labour supply, increasing efficiency of workers, reduction in the intensity and frequency of industrial unrest and so forth; but we must not brush aside the fact that such a correspondence between cost and benefits to the employers cannot be unchallengeably established on theoretical or practical grounds. Apart from it, there is sure to be a time-lag between cost and benefits; and as in this time-lag the problem of competition would be keen, there is good reason for the adoption of a smooth process of stage-by-stage evolution.

Social Insurance Step by Step

Our advocacy of a unified system of social insurance and the opposition to the introduction of the entire system by one stroke of the pen are not, however, of the same category to which the worn-out argument that "the present is not the opportune time for the introduction of social insurance in this country," belongs. For we definitely maintain that all the contributories to the tripartite insurance fund in India can at present certainly contribute, if not in respect of all the risks, at least in respect of one or two risks. That is within the paying capacity of all the three parties, as is partly clear from their recent attitude in this regard. More specifically, we would suggest the introduction in our country of social insurance branch by branch according to a predetermined schedule and pattern; so that while we may implement only one branch at a time, and one after another in agreement with our resources and requirements, every new branch which is called to life might not follow its own path and contribute to a haphazard and assymetrical growth, but might occupy its own place in the harmonious and rhythmical pattern drawn up in advance and to be realized at the end. From this angle, it would be necessary for us, first of all, to draw up a comprehensive and all-embracing plan of social insurance. Better still, if it is a plan of social security and includes not only social insurance but also social assistance. The next step should be the introduction of one branch of social insurance only, to begin with, for which purpose health insurance is pre-eminently fitted. Health insurance was the first system to make its appearance in foreign countries and is the simplest and most workable on account of the comparative fixity and predictability of the risk involved and the ease of administration and dispensing of the benefits. Indeed, the actuarial system, causing such serious complexities ordinarily, can be entirely got over by the adoption of the assessment of budgetary technique in the case of health insurance. To health insurance can later be added up slowly and gradually the other types of social insurance schemes.

This, in our view, would be the ideal evolution-pattern for us to adopt and follow in this regard. Though we do not know how the Government mind is working in this direction, it appears that they are already approaching the problem from this angle; and if so, all credit to them. They first appointed Mr. B. P. Adarkar to draw up a scheme of sickness insurance and, for all we know, this might have already been submitted to the Government and might be receiving their attention. And now they have appointed the aforesaid Labour Investigation Committee (i) to collect data relating, *inter alia*, to wages and earnings, employment, housing and social conditions of labour, and in particular of industrial labour in India, and (ii) to investigate and report, *inter alia*, on the risks to which labour is exposed and the most suitable methods of meeting these risks. We are glad to note that the officer who prepared the Sickness

Insurance Scheme is a member of the Labour Investigation Committee as well, which would ensure that the Sickness Insurance Scheme would be dovetailed in the wider scheme now on the anvil. What we do not, however, fully understand is the reason of the Government's decision to give the task of framing the actual scheme of social insurance to another committee to be subsequently appointed. Surely the Committee which is entrusted with investigation can as well draw up a suitable scheme of social insurance. It would be economical, in points of time, money and energy, to adopt this direct method rather than follow the indirect and long-drawn one. Should this be the result of a fear that the preparation of the whole scheme would mean its immediate implementation and consequently this method has been adopted to while away time, we submit that the fear is altogether baseless and the indirect method now adopted entirely unnecessary. The Government should make their policy in this regard clear and declare that the entire social insurance scheme cannot be all at once introduced in this country, which we hope would go a long way in clearing the atmosphere.

We would, therefore, suggest to the Government of India that they must (i) declare their intention of introducing a comprehensive and unified system of social insurance in this country in due course of time; (ii) commit themselves to the principle of hastening slowly and of following a process of stagified evolution of social insurance; (iii) give to the Labour Investigation Committee the actual task of framing the Social Insurance Scheme for India as well; and (iv) introduce Sickness Insurance Scheme as soon as possible. This four-pointed programme would allay all suspicions, remove false fears, satisfy workers and employers, strengthen the case for economic planning, and even otherwise improve the prospects of the introduction of a full-fledged system of social insurance in this country.

Textile Training Scheme in Australia

Government to Establish Schools

AS part of an overall rehabilitation scheme for service men and women, devised for the purpose of training to suitable peace-time occupations upon discharge from the services, the Federal Government is preparing to establish textile schools in Melbourne, Sydney and Geelong.

The Gordon Institute of Technology at Geelong is to become the "university" of textiles, and will undertake advanced training equivalent to the highest English textile courses.

The establishment of intermediate schools in Melbourne, Sydney and Geelong will provide for part-time instruction for those about to enter or already engaged in the industry, and should supply a much-needed link in the chain of industry development.

It is presumed that these textile schools will train the student to the leading hand or possibly foreman or forewoman stage, and that the Gordon Institute would supply the full breadth of textile education required by technical executives.

Ready support is forthcoming from all sections of the textile industry to these proposals by the Government. There is, however, one link missing, as there is great need for a primary or elementary textile education which would give children of pre-school leaving ages a textile consciousness.

A practical suggestion which has already been put to the Government, and which will no doubt enlist considerable support from all sections of industry, is that elementary textiles should be added to the curriculum of all existing technical schools throughout the Commonwealth. A start could be made in those areas in which the manufacture of textiles is already carried out and gradually extended throughout Australia.

The cost of equipment for such a scheme would be exceedingly small, as the curriculum would be planned to instil merely the fundamentals of textile materials and the principles of the different methods of fabrication.—*Textile Journal of Australia.*

Industrial Fatigue—II

BY KRISHNA CHANDRA MOOKERJEE, M.SC. (Cal.),

The Tata Institute of Social Sciences, Bombay

(Specially Contributed)

THE laboratory investigations of muscular fatigue have been largely responsible for bringing to light many of the important factors hitherto unknown to the research workers in this field but having an important bearing on the general problems of identification and measurement of fatigue. Such experiments and investigations were mostly conducted on the freshly exercised muscles of newly killed frogs. As in the early history of the discovery of many useful and well-known medicines and injections, here also we find many unfortunate frogs laying down their lives for the cause of science and the betterment of the human race. Frogs were selected for such experimentation because of the comparative ease with which the leg muscles of these animals can be exercised by merely stimulating the motor nerve attached to the muscles in question with an electric current. When an electric current of low intensity (i.e., E.M.F.) is allowed to pass through the leg muscle of a freshly killed frog, the muscle will at once respond by contracting. This contraction, resulting from the application of the appropriate stimulus, may be regarded as the amount of work done by the particular muscle and can almost always be evaluated in terms of proper units, viz., ergs. It would be rather interesting to observe the nature of the subsequent contractions effected by a further continuance of the same stimulus. After the first contraction has been properly and adequately obtained with a particular stimulus, if another stimulus, i.e., electric shock, having the same intensity as the first one, is applied after a small time interval of, say, one second, between the two stimulations, a second contraction results which is found to be slightly larger than the previous one. In this way if the application of the stimulus of the same strength be continued for some time, after allowing a little time gap between the successive trials, a staircase diagram is obtained in which the important feature is that every contraction is greater than the preceding and earlier ones.

Results of Experiments on Frogs

In this description there are two points which deserve special attention. In the first place, it has been advised that each time before the application of the same stimulus (i.e., a stimulus having the same intensity) a time interval of preferably one second or a little more is to be given so as to ensure the successful operation of the muscle in question. The danger of allowing a longer time interval is obvious since in that case the proposed rest will adversely affect the subsequent contractions by directly counteracting the effects of fatigue, the seat of which in such a case is no doubt the muscle suffering from the cumulative effects of continued stimulations. The findings of the investigators in this field almost conclusively prove that the longer the time interval between the successive applications of the same stimulus, the less are the observable effects of muscular fatigue and hence greater shall be the resulting contractions, other conditions remaining the same. This greater and still greater contraction invariably indicate that the capacity of the muscle or its power to do further work increases more and more with successive stimulations. This is somewhat interesting but nevertheless is in full agreement with the laws of muscular activity. The almost continuous increase in the amount of contraction exhibited by a muscle under the foregoing conditions upto a certain point can be explained as due to the resistance being gradually and progressively lowered in the path of the incoming impulses as a result of the previous activity of the muscle which was of a continuous nature with small breaks. Theoretically it may be said that the maximum contraction for a particular muscle will always correspond to the minimum of the resistance lying in the path of conduction and this can be proved by the accumulated evidence from physiological researches. Popularly, it may be stated that a muscle is capable of doing more and more work if its inertia which results from inactivity can be sufficiently overcome and the resistance adequately counteracted. Both these states in a muscle are no doubt influenced and conditioned by any previous activity, either of a continuous or of a discrete type, to which the muscle has been subjected. Besides the popular and physiological explanations to account for the greater and greater muscular contractions effected by subsequent stimulations, other conditions remaining the same, some investigators have ascribed this state of a muscle with its increased capacity to the presence of some chemical substances which are formed in the muscle itself as a result of its previous activity. The formation of these chemical compounds, according to them, adds to the working capacity of the muscle by supplying it with a readily usable fuel in some easily assimilable form. The findings of these investigators in this connection further point out that two of the products thus formed, namely, carbon dioxide and lactic acid, in small quantities, have been found to increase muscular power and capacity for further work.

Secondly, the increased contractions referred to above cannot go on indefinitely nor for any length of time. On the contrary, there is a limit to these successive increases in the contractions and this limit is soon reached after the starting of the experiment. Once the maximum contraction is reached it does not begin to fall off immediately but remains stationary for a period as if to be observed and recorded and then falls off steadily and continuously till complete fatigue of the muscle ensues.

Recording Muscular Contractions

The contractions to which a reference has been made in the earlier section, in order to be studied and compared, must be recorded by some suitable means. The recording device must be of such a nature that the contractions, both original and successive ones, whatever be their amplitudes, in the course of an experiment, should automatically leave a trace which would admit of their being read and marked off for practical purposes. This need for an automatically recording device has been met by A. Mosso, who invented an instrument for this purpose, subsequently called by him an ergograph, which may be employed with very great advantage for recording the contractions of the muscles referred to above. Mosso's ergograph has been so devised that it can record very satisfactorily the work done by a particular muscle or at the most by a group of muscles of the body of an organism. A brief description of the instrument and its working has been provided elsewhere in this article for those who are specially interested in it. The actual tracing obtained during an experiment in the rotating drum of the instrument in the shape of a curve is technically called an 'ergogram' and in all cases comprises the individual strokes resulting from the movement of a particular muscle or a group of muscles activated by the same stimulus. Each and every stroke in such an ergogram represents the movement of the lifted weight hanging from one end of a string, the other end of which passes over a pulley (*vide* description of the instrument). The height of every stroke represents the actual height to which the suspended weight is raised every time due to the movement of the muscle under investigation. In order to calculate the amount of work done by a muscle or a group of muscles in such an experiment one has to measure out the length of each stroke very accurately and then to combine it with the magnitude of the lifted weight. The computations are very simple and based on the formulæ,

$$\text{Work done} = F \times D,$$

where "F" stands for the force and "D" for the distance to which the weight has travelled in doing a certain amount of work. This force is again to be resolved into the product of "mass" and "acceleration" or, in other words,

$$\text{Force} = \text{Mass} \times \text{acceleration}.$$

Fig. I below illustrates some typical ergograms obtained in a series of experiments conducted under strictly prescribed laboratory conditions. The four curves representing Fig. 1 have been obtained for the same subject but for different muscles of the body, e.g., arm, leg, finger, and hand as mentioned against each.

Brief Description of Mosso's Ergograph

In this instrument the forearm and hand (either left or right), together with all the fingers excepting the middle one, which would do the work in an experiment, are firmly and securely fixed with the palm of the particular hand in the uppermost position. Instead of the middle finger any other finger might be selected for the purpose, but this instrument has been so designed that it would be most convenient to use the middle finger only and no other. Next a string is connected with the uppermost part of the middle finger in the form of a loop and the other end of it passes over a pulley and is kept in position by suspending a weight at the free end. This pulley and the accompanying string arrangement is usually fixed at the edge of the table on which the whole instrument is supposed to work. The suspended weight need not be very heavy and differs from person to person and also sometimes from experiment to experiment. However, usually the weight is two to three kilograms with adjustable arrangement so that it might be increased or decreased if the necessity arises. When the instrument has been set as outlined above, the flexion of the free finger, in the present case the middle one, lifts the weight suspended by the string passing over the pulley and each of these lifts are recorded automatically on the smoked surface of a rotating drum, which has to be kept by the side of the subject, by a light pointer which connects the surface of the drum with the sliding string so that the movement of the weight and the corresponding string is imparted to it.

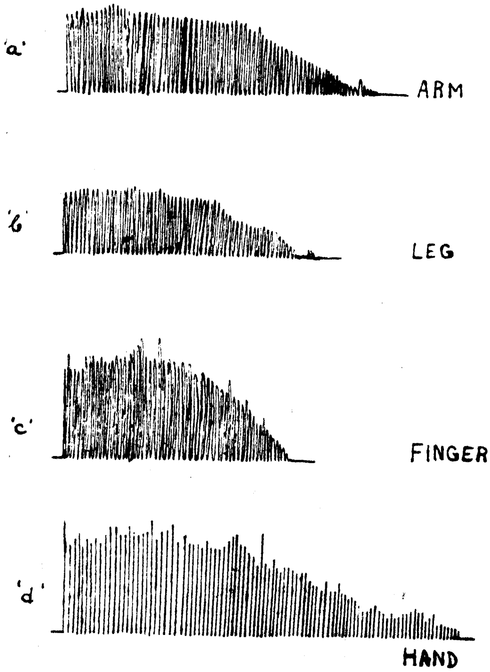

Fig. 1.—Typical Ergograms (After Yochelson)

It would be worth while to examine some of the important facts which have emerged as a result of the laboratory investigations of muscular fatigue with the help of Mosso's ergograph in the light of the curves presented here, and these are as follows:—

(1) These curves do not show the features of a "staircase" diagram as discussed in the earlier section. It should be remembered that the staircase diagram is only obtained from the results of electrical stimulation of the leg muscles of a freshly killed frog. In case of activating muscles with natural stimuli other than the electric shock, the nature of the curves would be as has been represented above in Fig. 1.

(2) All the four curves show a regular decrease almost from second to second, (which is the unit of time in the present experiments), in the height of the strokes. This almost progressive decrease in the height of the strokes can only be interpreted as the corresponding decline in the amount of work done by the muscles in question, since the length of strokes is the measure of work done.

(3) The fall in efficiency of muscular action in at least two of the four illustrations cited above, is observable only toward the end of the time period and then when it appears it is rather abrupt but afterwards it becomes somewhat steady so far as it affects the general nature of the curves under reference.

(4) The general trend of the fall in efficiency is that it is somewhat pronounced at first and then the rate slackens up again till towards the end it speeds up once more before finally exhibiting the effects of fatigue. This fatigue state is indicated by the decrease in the height of the strokes so much so that in the course of a few more seconds a point is reached, when the weight which the subject was so long lifting easily, can no longer be lifted by him, however much he may like to do so. This point represents the limit of work of the finger and may be regarded as the

exhaustion point of the finger, at which its capacity to do further work has been temporarily reduced to zero. In the curves represented above these are the points where the strokes have ceased to be recorded altogether and the marker tends to touch the horizontal base line, proving that the respective weights have stopped moving or sliding over the pulley. In the case of the finger muscles, however, this temporary incapacity does not last for a long time. A rest period of small duration would enable the muscle to work again after partially recovering from the effects of fatigue although this time the total amount of work done by the same muscle before the point of exhaustion is reached, is usually less than that done during the earlier and preceding period of the experiment.

(5) It has been observed that if some convenient rest pause is allowed between each contraction of a muscle, fatigue effects do not occur or at the most its chances are remote. The duration of such a rest pause would naturally depend on the particular muscle called into play and also in no small measure on the nature of the work required to be done by the said muscle. If, for example, the lifted weight be considerably heavy so much so that its lifting even for once or twice would cause the muscle to be fatigued, then in such cases the intervening rest period must be of sufficient duration so as to enable the muscle to recover completely from its fatigue effects; but in such cases it is doubtful if prolonged rest between successive contractions of the muscle would be able to protect the muscle from the effects of fatigue indefinitely or for all time to come. Nevertheless, the observation holds good in its entirety in the case of the smaller muscles when these work with usual weights, as they have been activated in the foregoing examples.

(6) When complete fatigue results, i.e., after the point of exhaustion has been reached, it requires a much longer period of rest to effect a complete recovery from it. This period in the case of the finger muscles has actually been found to be nearly two hours. But this period extends considerably, as has been found to be the case, if the subject, after he has been completely fatigued in the usual course, has been induced to make some further desperate attempts to lift the weight.

(7) The rapidity with which fatigue sets in a particular muscle is very largely conditioned by the number of contractions made in a certain period of time. This can be actually verified in any experiment by counting the number of contractions made by a certain muscle during a unit period of time. The larger the number the more rapidly the onset of fatigue. The amount of work that a muscle is capable of doing is likewise dependent upon the nature and amount of the contractions.

(8) It has been observed that fatigue of a certain muscle or group of muscles of the body adversely affects the working capacity of other muscles of the body.

(*To be continued*)

OFFICIALESE

A manufacturer proves unreasonable enough to complain of a circular lately received from a Government Department containing the following:—

"No such manufacturer shall during the said period supply cloth of any description which the manufacturers to whom these directions apply are permitted to manufacture by virtue of the preceding paragraph, if the total quantity of cloth of that description, which, during that period, has been manufactured by such manufacturers and supplied by them would thereby exceed or has already exceeded the relevant percentage of the total quantity of cloth of that description which the said manufacturers are permitted to manufacture by virtue of the preceding paragraph."

It is a piece of very ordinary officialese at least as luminous as an Act of Parliament, requiring not more than two wet cloths (and a reference to the preceding paragraph) for its due understanding. Doubtless this would not have been the manufacturers' own way of expressing the meaning. Maybe it is not even the best way, but it is the regrettable case that a Civil Servant caught in the act of translating his meaning into ordinary terms would very quickly be put on the carpet.—*Mercantile Guardian.*

Magnesium Chloride Industry in India

Part Played by the Pioneer Magnesia Works Ltd. in its Development

BY KHAN SAHIB J. S. CAMA, B.A. LL.B.

(*Specially Contributed*)

MAGNESIUM chloride is one of the most important ingredients required in cloth sizing. It is hydroscopic in character, and is used along with other substances like wheat starch, china-clay, tallow and zinc chloride for the purpose of weight-giving and helping to keep the sized yarn pliable and moist in its passage through the healds and reeds in the weaving process.

It is interesting to note that the natural mineral salt, with its wide and important range of industrial uses, is contained in sea water, natural brines and the waters of many springs. It also occurs in salt beds in combination with potassium and calcium chlorides.

Magnesium chloride is obtained as a by-product in certain chemical industries by the action of hydrochloric acid, which is a mineral containing mainly magnesium carbonate. It is, however, prepared on a large scale at Stassfurt in Germany as a by-product of potassium chloride. For a long time this was the only source of the commercial product, until Ballard, the famous French chemist, and several others who followed his researches, made this possible on a large scale from the mother liquors resulting from salt manufacture from the natural brines and sea waters.

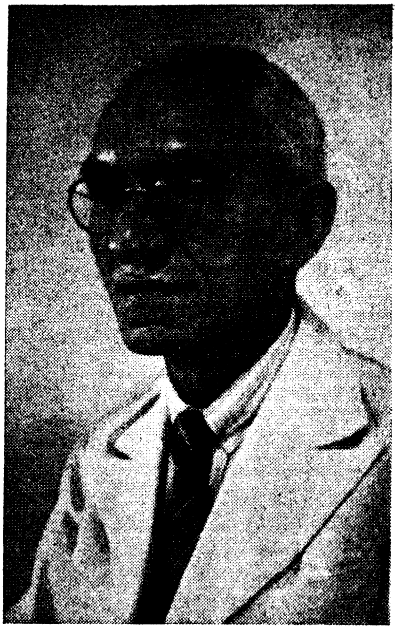
Before the last World War, Germany held the monopoly of the world's trade, and used to supply almost the whole quantity, amounting to about 5,000 tons, imported into India for textile purposes.

At Stassfurt there are large deposits of the mineral known as Carnalite which contains potassium chloride and magnesium chloride with traces of bromides and iodides. Magnesium chloride forms the greater portion of this carnalite, and has to be eliminated before the recovery of potassium bromides and iodides, so that it could be exported as a by-product at a little cost. It was also generally shipped as bottom cargo at low freight rates.

In 1914, as soon as the first World War started, the supplies dried up, and prices began rocketing high, with the result that Government's attention was drawn to the rich source of waste bitterns available in the Kharaghoda Runn after the salt manufacture was over, and steps were taken to examine the position and to invite tenders for its exploitation and supply to the mill industry. Mr. P. V. Mehd, M.A., B.Sc., succeeded in getting the first contract in 1915 on the basis of a certain royalty payment to Government. Thereafter the next contract was secured by a private firm consisting of the Hon'ble Sardar Sir Rustom J. Vakil, and Messrs. B. S. Lalkaka and P. V. Mehd, working under the name and style of the Pioneer Magnesia Works, on royalty basis. Crude bitterns as such were at first collected and removed to Ahmedabad, and in the absence of suitable arrangements for refining, were absorbed by the mills in the original form in place of magnesium chloride.

This arrangement continued from year to year till 1918 when a long-term contract was signed between the Government of India and the firm through the efforts of the then Director of Industries, Mr. (afterwards Sir) Robert Bell, I.C.S., and a factory was established at Kharaghoda with the advice and technical guidance of Dr. A. J. Turner and Principal Dawson of the Victoria Jubilee Technical Institute, Bombay. A motor rail car costing nearly £2,500 was also brought from England for hauling the bitterns from the agar to the factory. This had later to be discarded owing to its unsuitability for various practical reasons in favour of the present transport arrangements by means of hand-shunted railway wagons mounted with cisterns containing the liquid bitterns filled from the farans in the Runn.

The bitterns on arrival were transferred into big reservoirs at the factory and utilized for the manufacture of magnesium chloride according to requirements. For a number of years, this was the only product manufactured. Then in 1925, with the expert advice and assistance of Mr. Kapilram H. Vakil, the present Technical



Mr. Behramji S. Lalkaka has made his mark as a businessman and industrialist. He is engaged in the manufacture of chemicals such as calcium chloride, potassium chloride, bromine and magnesium chloride, and many others required for the Defence services and the mill industry.

He is the Managing Director of the Pioneer Magnesia Works, Ltd., Bombay, and the Pioneer Chromate Works, Andheri, which are pioneer enterprises in this country in their respective fields. Besides he is a senior partner of Messrs. Nowroji Pestonji & Co., Ahmedabad, who have been working as the Government Salt Agents at Ahmedabad and Kharaghoda since 1873. *He is also a Director of several other business concerns.*

Mr. Lalkaka is a member of the well-known Vakil and Lalkaka family of Ahmedabad, and is a managing trustee of many charitable and public trusts created by his grandfather, the late Sir Nowroji Pestonji Vakil, of Ahmedabad. He is of a most unassuming temperament, and has travelled many times abroad.

Director of the Tata Chemicals Ltd., of Mithapur, near Port Okha, the Kharaghoda bitterns were sent to Germany for critical examination and report, and the factory was also re-designed, and further improvements were made for greater efficiency and fuel economy under the advice of Mr. Fakirji E. Bharucha, the well-known mechanical engineer, and at one time acting Director of Industries.

A word or two about Kharaghoda where the magnesium chloride is manufactured will not be out of place. Kharaghoda is the name of an important place, on the borders of the little Runn of Cutch, where for more than threescore years and ten, the Pritchard Salt Works of the Government of India have been situated. The name " Kharaghoda " may well be derived from the word " Khara " meaning " brackish " and " Ghoda " meaning " wells," which connotes, so to speak, " brine wells "—judging from the nature of the sea brines percolating through the sandy desert with which the whole area is saturated. Geographically, Kharaghoda is 400 miles to the north of Bombay, 60 miles from Ahmedabad, and only 20 miles from the important railway junction of Viramgam, on the main B. B. & C. I. broad-gauge line, connecting Gujarat and Kathiawar. Geologically, Kharaghoda is a dried arm of the sea forming part of the barren sandy waste known as the Runn of Cutch on the western coast of Kathiawar, and extending about 80 miles from east to west, and 20 to 40 miles from north to south, covering an area of nearly 2,000 square miles and stretching right up to the borders of Sind. That this was at one time the bed of the navigable sea could be seen from records, and this is further proved from the small wooden remnants of boats and carts, etc., that are often found embedded in the lower strata in which shells, fossils and other marine deposits are also found. This sea-bed is supposed to have been raised by repeated cataclysms and earthquakes (giving rise to the present salty waste) some few hundred years ago, so that the sea which is the prime source of brine has now receded to about 60 miles further towards the Gulf of Cutch. The closest analogy to this may be the Dead Sea deposits in Palestine, which are immensely rich in all mineral salts running into millions of tons, so much so that the supplies are believed to be almost inexhaustible for all human needs for many a generation to come.

The common salt separates out by the evaporation of sea water by solar heat. The residual waste liquor after the separation of salt is generally known as bitterns, " mutterlage," or mother liquor, which becomes the raw material for the extraction of other valuable minerals, such as Epsom salt or magnesium sulphate, magnesium chloride, potassium chloride and bromine. The bitterns are left in the salt pans after sodium chloride (common salt) is formed. It is, therefore, a by-product of salt manufacture, being usually found in the ratio of 1 to 12 at Kharaghoda, where the manufacture of salt on a large scale is carried on under the control of the Salt Department of the Government of India. The mode of manufacture here differs considerably from that in other places in the Presidency.

The Pritchard Salt Works at Kharaghoda were opened in 1873, i.e., about 72 years ago. They produce on an average about 35 to 40 lakhs of Bengal maunds of " Badagra salt."

The salt manufacture begins after the rains are over, when the brine with which the sandy soil is saturated is raised and filled into salt pans to a depth of 9 inches to a foot, and is allowed to evaporate over a period of 6 to 8 weeks. Incrustations of salt are formed at the bottom, and the floating bitterns or mother liquor is then drawn off and conducted into separate channels known as " farans." Fresh brine is then superadded by slow degrees, until actual salt cubes are formed, which are ready for extraction and storage by April. The Salt Works are covered by a number of railway sidings about 40 miles in length, and are a regular hive of industry in the busy working season from November to May each year, giving employment to several thousands of labourers who are known as " agarias."

The bitterns which are drawn off to the extent of several thousand tons annually during salt manufacture, are exceedingly rich in magnesia salts. They are now utilized for the manufacture of magnesium chloride, the main use of which is as a sizing agent, required by the textile mills all over the world.

The bitterns left in the pans, after the manufacture of common salt from sea water, contain more of Epsom salt and other ingredients. The brines vary considerably in composition even in the adjacent wells.

It may be of interest to note that another up-to-date factory in India for the weaning of magnesium chloride (mainly for export) and its allied products, viz., Epsom salt and potassium chloride from sea water, was put up by the Pioneer Magnesia Works at Mithapur in 1929, in conjunction with the Okha Salt Works Ltd., under the able and expert guidance of Mr. Kapilram H. Vakil, a chemical engineer of repute. This was, however, later absorbed and bought over by the Tata Chemicals Ltd. in 1939, when their big chemical plants came to be established at Mithapur.

The first stage of operation at Kharaghoda begins with the collection of the bitterns in the "agars," and their subsequent transport to the reservoirs of the factory for some time by means of a (motor) rail wagon with a special tank attachment, and now in railway wagons with cisterns mounted on them. As the bitterns are allowed to concentrate further in the reservoirs, the collection is carried out considerably in advance of their utilization at the factory. The manufacturing operations are designed to eliminate some common and other salts, as well as suspended clay and other heavy impurities. The latter settle down in the reservoirs. The bitterns, now very rich in magnesium chloride, are then passed through a boiling process. The magnesium chloride is finally recovered as a hot liquid, which is poured into strong galvanized drums, where it solidifies, and is ready for export from the factory.

The company's premises occupy an area of about 40,000 sq. yards of land, on which are situated their factory buildings, workmen's chawls, drum-making plant, and store houses, as well as two well-built bungalows for the use of the proprietors and the supervising staff. Huge reservoirs, cemented and stone-paved throughout, have been constructed with a capacity of a few thousand tons of bitterns. A stock of several thousand drums of the finished product is always kept ready to meet any demand.

The magnesium chloride separates out from its saturated solution as transparent, silky, needle-shaped crystals. These crystals are formed by the union of one molecule with six molecules of water, generally called water of crystallization. The commercial quality of magnesium chloride contains this water of crystallization, and it is for this reason that the analysis of the commercial samples shows about 52 per cent. of combined water or water of crystallization.

When the crystals are formed, a limated crystalline solid is formed. The water of crystallization is not removed by simple melting, and the substance still remains as hexa hydrate.

The fused quality is a white semi-transparent mass having an appearance similar to white paraffin wax.

Magnesium chloride rapidly absorbs moisture from the air, and it is decomposed on heating to a high temperature, and has a bitter and saline taste.

The Kharaghoda magnesium chloride is specially prepared for textile use, and is available in the following forms:—(1) Crystals, (2) fused crystals, (3) semi-fused solid, (4) flakes, and (5) solid fused. All the fine qualities contain water of crystallization. A chemically pure 100 per cent. quality is not in technical use. All the high grade commercial qualities contain generally 98 per cent. magnesium chloride as hexa hydrate.

In 1928 intensive research was carried on by the Pioneer Magnesia Works Ltd., with the help of Prof. D. D. Kanga and Dr. M. S. Shah of the Gujarat College, at Ahmedabad, at a cost of nearly Rs. 10,000 solely for the production of Epsom salt and potassium chloride obtainable from the Kharaghoda bitterns, but although the results were successful, no practical effect could be given to them owing to innumerable difficulties. Besides, the layout of the Pritchard Salt Works, which are so widely spread out, was never designed for by-products manufacture. In 1935, the firm was turned into a private limited company, with Mr. B. S. Lalkaka as Managing Director and Mr. F. R. Moos as Manager and Secretary, working under a Board of Directors.

Since 1925, a series of attempts have been made to export the Kharaghoda magnesium chloride to foreign countries, with the result that before the present world war began in 1939, the Company had already succeeded in sending out more than 2,000 tons annually to Great Britain and distant parts of Europe like Holland, Denmark, Sweden, Czechoslovakia, and even to Australia and South Africa, in the teeth of German competition; in spite of serious difficulties during the present war they are still being sent out to Britain and the Dominions, subject to shipping and other export restrictions. This is a great achievement, especially as apart from any raw materials magnesium chloride is one of the very few finished articles ever to be exported from India to Western countries; and that would tend to show that in quality and price, the company has made a name for itself and can hold its own against any foreign competition. The industry had, however, to pass through bad times, and even to go to the Tariff Board for protection on three occasions, viz., in 1924, 1928 and 1938. Its claim for protection, however, had been turned down on the first two occasions, and was only conceded on the third occasion, and the then existing 15 per cent. *ad valorem* duty on foreign imports which had been removed to placate the mill industry was instituted as a protective duty. This has, however, considerably helped to consolidate and develop the industry. Here it will not be out of place to quote the following passage from a brochure entitled " Tariffs and Industry " by Dr. John Matthai, the well-known economist and industrialist, who was at one time President of the Tariff Board and Director-General of Statistics of the Government of India. He says:—

> In the whole course of the Tariff Board's existence, there has been only one case in which the Board has declined to grant protection to an industry on the ground that it will not be able to dispense with protection eventually. This is the magnesium chloride industry. The Tariff Board declined to grant protection to the industry in 1924 on this ground. The Government accepted the Tariff

Board's conclusion. Three years later, in pursuance of the Government's policy of reducing or abolishing the duties on materials required by the cotton textile industry, even the revenue duty on magnesium chloride was removed. In 1928, the industry came up again for protection, and in this inquiry it was found by the Board, on a review of costs and prices, that the industry would not merely be able to dispense with protection ultimately, but that it did not require any greater assistance than the restoration of the original revenue duty. The case of the magnesium chloride industry provides an interesting illustration of the practical difficulties involved in the application of the crucial conditions on which Discriminating Protection is based.

The very fact that this comparatively infant industry has been able to keep its head above water in spite of the 15 per cent. import duty being removed by the Government is due to the able management, zeal, foresight, perseverance, dynamic energy and indomitable will of one of its founders, Mr. B. S. Lalkaka, the Managing Director of the company. Mr. Lalkaka's acute business acumen, tact and ability have enabled this infant industry to steer clear of the shoals in the face of dangers from Germany, Japan and Palestine; and the foundation is laid on a firm basis, which would enable the industry to make headway through storm and stress.

The two most widely known uses of magnesium chloride are for cloth sizing, and for use as jointless composition flooring along with magnesite, as in Europe and America, and in other more advanced countries.

The total normal consumption of magnesium chloride in India may be roughly put at 7,000 to 8,000 tons per annum, but owing to the Size Control Order, this has now considerably gone down, and could only be estimated at about 3,000 tons maximum. The production, on the other hand, has increased materially, for instead of the one factory at Kharaghoda, magnesium chloride is now produced in fair quantities at Mithapur, near Port Okha, in Kathiawar, and also at Kuda nearby in the Dhrangadhra State. This has naturally led the Pioneer Magnesia Works Ltd. to carry on further investigations to see how far the use of magnesium chloride in other ways could be enhanced by utilizing this as the basis for various other new products and derivatives, and for this purpose, they have spent a few thousand rupees by providing research scholarships at the Department of Industries, the Royal Institute of Science, and last but not least, at the Department of Chemical Technology in Bombay, where a Fellowship is also established. With their help, and in close collaboration with these technical advisers, the company's staff, consisting of Mr. M. S. Chudgar, B.Sc., Works Manager, and a few other chemists including a B.Sc. (Tech.) with good qualifications, have succeeded in manufacturing, besides magnesium chloride, several other products, amongst which may be mentioned the following:—

Magnesium chloride—for cloth sizing and flooring use.

Epsom salt—for textiles and medicinal use.

Kainite and potassium chloride—for fertilizers and bichromate industry.

Magnesium carbonate—for use as a filler in the rubber (light, medium and heavy) industry and in 85 per cent. magnesia and dentifrice.

85 per cent. magnesia—for lagging of pipes and boilers for heat conservation.

Calcium chloride—for refrigeration. This is being supplied almost entirely for the Defence services, and to the ice factories and air conditioning plants, under orders of the Chemicals Directorate, New Delhi.

Potassium chlorate—for medicinal use, and as an explosive, and for use in match factories.

Bromine and bromides—for medicinal purposes, and for photographic and other uses.

Calcium carbonate—for dentifrices, and as a food preservative, etc.

Barium chloride, and so on.

Owing to the scarcity of raw materials and various restrictions as to transport and other priorities, many of these plants are not fully running, though the company is not without hope that when normal peace conditions are restored, it would be possible to work them economically and efficiently against all ordinary healthy competition, whether local or foreign. In the past, the magnesium chloride industry in India had been seriously threatened with extinction both from Japan and Germany, so much so, that in order to kill this nascent infant industry, the product was even dumped on the Indian market at below cost, which would not even cover the Government royalty payable by the Pioneer Magnesia Works Ltd. The whole account of this unequal fight which the industry had to put up against the German Magnesium Chloride Syndicate will be found published in the various Tariff Board Reports.

Magnesium Chloride in Textile Industry

Every sizing master knows the properties he wishes to impart to his yarn, but the problem of how best these may be obtained is not always easy of solution, and varies according to the nature of the yarn and the general conditions.

Strength and softness are the primary qualities to be obtained. Since the early days of spinning, various mixtures have been used, some with indifferent effects, others with better success.

An additional object of the size is to give the yarn a good " feel," and also, for commercial purposes, added weight. The addition of magnesium chloride to the size softens and strengthens the yarn, and generally much improves the subsequent weaving. Among the common ingredients of the size are:—

Flour, china-clay, tallow, starch, magnesium chloride, zinc chloride and Epsom salt.

Where the weather is very dry, a larger proportion of magnesium chloride is used. For instance, in the Bombay mills 30 to 40 per cent. size is used, whereas in Ahmedabad, even upto 100 per cent. was common. The drier climate of Ahmedabad entails the use of more magnesium chloride.

The Pioneer Magnesia Works Ltd. have been ably serving the needs of the country, and have been providing the mill industry with a product of good quality, equal in all respects to the best imported article and at a uniformly low rate, without the slightest thought of war-time profiteering even though the manufacturing costs have gone up by leaps and bounds. Whereas in 1939, just before the present World War, the average prices of magnesium chloride were round about Rs. 4-8 to Rs. 4-12 per cwt. f.o.r. Bombay, the present basic rate has not gone beyond Rs. 6-8 to Rs. 7 despite very many handicaps and increases in cost all round. That shows how the company has done its level best to maintain prices as low as possible without caring to take undue advantage of its position.

The Pioneer Magnesia Works Ltd. have also in view a post-war programme of development, and would very much like to re-design their present plants on more model lines, and to add a few other important chemicals which could be usefully manufactured at their Kharaghoda Works, provided there is any reasonable assurance of support from Government.

Thomas Korula Bombay

THE factories of Thomas Korula have been shifted to their own premises at 249 Worli, Bombay. The new factory is built to suit their requirements in the most up-to-date fashion. The rubber factory is equipped with the latest machinery and turns out gloves for industrial and medical uses, waterproof sheetings, rubber and ebonite rollers, dobby cord, elastic webbing, rubber thread and cord, moulded goods of all descriptions, gharry tyres, trolley wheels, rubber insulation, etc.

The non-ferrous metal factory is producing all gauges of wires, rods, etc. It is equipped with the latest type of tilting and annealing furnaces, rolling mills, multiple reduction draw benches, etc. They do refining, casting and rolling of non-ferrous metals.

To-day the factories are keeping pace with the Services by devoting their major time to the production of Government and essential Services' requirements. In fact, in certain items they are the only firm in India capable of producing them. In the wake of peace it will be their endeavour to revert to the service of the general public, whose appreciation of their services in the past has always been considered favourably.

COTTAGE INDUSTRIES INSTITUTE

Gulzarbagh, Patna

THE Cottage Industries Institute, Gulzarbagh, Patna, has contributed largely towards the improvement of the handicrafts of the Province of Bihar by training skilled artisans and organizers; by introducing improved appliances and supplying raw materials and technical advices; by conducting experiments with a view to evolving improved methods of manufacture, and by testing yarn and cloth samples sent by the handloom weavers from all over the province.

History

This Institute is the result of the expansion and development of the cotton experimental and testing station started at Ranchi in 1922, which, with the removal of the Headquarters of the Department of Industries to Patna, was transferred to Gulzarbagh. The Institute in its present form was formally opened by Lady Wheeler on the 17th March, 1925.

System of Training

The Institute is run on commercial lines and under workshop conditions. As designs play an important part in the success of any handicraft, freehand drawing, painting and designing are compulsory subjects for students of all sections.

Control and Supervision

The Institute is directly under the Department of Industries and the Textile Expert to the Government of Bihar—Mr. N. P. Neemuchwalla, F.R.S.A. (Lond.), M.I.E.E. and an Advisory Committee appointed by the local Government.

The Superintendent of the Institute is in direct charge of the offices.

Admissions to the various departments are usually made at the commencement of the session in January of every year and are mainly restricted to natives of the province, preference being given to sons of artisans having previous training in the trade in which they are to specialize besides having necessary qualifications. Students from other Provinces and States are also admitted by special permission of the Director of Industries if they apply through the Director of Industries of their respective Provinces or States. The number of students admitted every year and the number of stipends available are as follows:—

Subject of industries taught	Number of students	Number of stipends
Cotton spinning and weaving—		
1st year	20	16
2nd year	15	12
Dyeing and Calico printing—		
1st year	16	12
2nd year	13	10
Tailoring—		
1st year	16	12
2nd year	13	10
Pottery manufacturing ..	12	8
Cane furniture manufacturing.	16	12
Carpet weaving	14	10
Knitting	14	10
Durree weaving	8	7
Newar and tape weaving ..	13	10
Lacquered toy making ..	14	12
Wooden toy making	10	8
Cardboard toy making ..	16	14
Paper making	14	10

Cardboard Toy Section.

Pottery Section.

Lady Rutherford, accompanied by Mr. N. P. Neemuchwalla (left), Textile Expert to the Government of Bihar, visiting the Cottage Industries Institute.

Students are required to deposit in the postal savings bank every month two annas per rupee out of the stipends paid to them. These amounts are paid to them on satisfactory completion of their training for the purchase of tools and raw materials required for starting such industries.

Hostels

Out-station students are given preference in the matter of admission in the hostel, which provides free accommodation for 100 boys and 12 girl students. Hindu and Mahomedan kitchens are provided in the hostel. There is a separate hostel for girl students.

Examinations and Diplomas

The students attend the lectures and practical classes for at least 75 per cent. of the working days for qualifying themselves to appear at the examination. Successful candidates are awarded diplomas of competency.

Examinations in theory, practice and commercial subjects are conducted by outsiders.

Lady Rutherford, wife of the Governor of Bihar, paid as many as four visits to the Institute during her short stay of two months in Patna. The Institute have supplied to the Government House, Patna, silk curtains, flower vases and other textile materials.

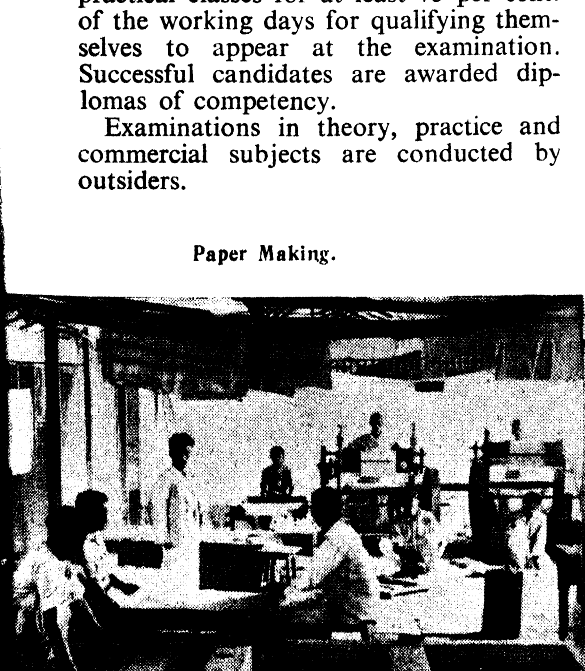
The photographs now published will give readers an idea of the useful work being done by the Institute.

The Institute has just passed through a very difficult year. Scarcity of raw materials, dyes and chemicals, spare parts of machines and knitting needles and their high prices affected its working; shortage of coal and of transport were other difficulties. Yet the year 1943 was notable for the institution of another centre for the technical training scheme of the Government of India. The Cottage Industries Institute trained 114 boys in textile re-fitting.

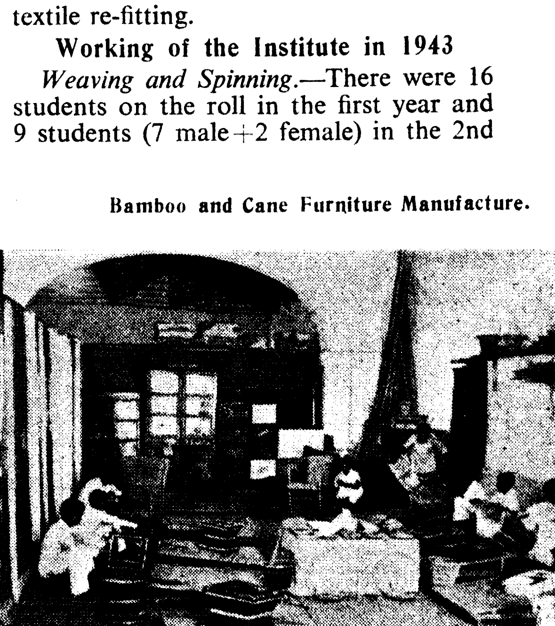
Working of the Institute in 1943

Weaving and Spinning.—There were 16 students on the roll in the first year and 9 students (7 male+2 female) in the 2nd

Paper Making.



Bamboo and Cane Furniture Manufacture.



year class. Besides the above there were two casual students deputed by the Nepal Government for training in sizing, dobby and jacquard weaving.

The section produced many improved designs of *sari* borders, coatings and towels, etc. Five yarn samples and 17 pieces of cloth samples received from different parties were also tested and results communicated to the parties concerned. Many sleys and other loom parts made by local carpenters were tested in the section before they were supplied to the parties. Necessary technical help was rendered to ex-students of the section and other interested parties from time to time.

Dyeing and Printing.—There were 12 students on the roll in both the sections: 7 in the first year and 5 in the second year. They were trained both in theory and practice according to the approved syllabus. Students were also taught indigo and alizarine dyeing.

During the year new varieties of shades on 2/80s yarn were dyed under the order of the Director of Industries. In addition to the matching of shades for the manufacture of *purdah* shades, this institute dyed the entire yarn of the Bihar cottage industries and no order was placed outside. Samples of new designs of printing were prepared.

Necessary technical help and assistance were rendered to the ex-students who have started their own dyeing and printing concerns.

Durrie and Carpet (including newar).—Eighteen students were admitted into both the sections, ten

Winding and Warping.
Weaving Section.

in the carpet and eight in the *durrie* section during the period under report.

New designs of *durries* and carpets, approved by the Director of Industries, were produced in the section during the year. Necessary technical help has been rendered to the ex-students of the section from time to time.

Knitting.—Ten students were admitted into the section in January 1943 and were trained in theory and practice according to the approved syllabus.

Experiments were carried on on the flat machine, and *ganji* cloth was produced with the tuck stitches. The double rib cloth was also tried on this machine, which was successful; sweaters and *ganjis* were produced out of this material. Some of the ex-students were helped in securing employment, Machines of Rajendra Hosiery and Aghore Nari Shilpa Pratisthan were examined and set right.

Tailoring Section.—There were 20 students in both the classes on the roll at the beginning of the year.

Attempts were made to train the second year students along with the ex-students of this section in the mass production of garments for which orders were secured from the "Civmil" Hostel, Bihar College of Engineering for 140 sets of dosuti uniforms (shirts and shorts). The proprietor of Messrs. Agarwal Fancy Stores of Moradpur was given help and advice in starting a ready-made clothing factory. In this workshop many ex-students are working as cutters, fitters, tailors, etc.

Indian Central Cotton Committee

Annual Report for the Year ended 31st August 1943*

HOW the extension of the war and the consequent closing of the export outlets for short-staple Indian cotton gave a great fillip to the efforts of the Indian Central Cotton Committee at improving the quality of Indian cotton is well brought out in the latest annual report of the Committee. The year under review witnessed a phenomenal increase in the area under staple cotton, particularly *Jarila* in the *Oomras* tract. The area under improved cottons rose from 5,663,000 acres, or 24 per cent. of the total cotton acreage in 1938-39 to 10,382,000 acres, or 54 per cent. of the total in 1942-43.

The total area under cotton in India during the year was 19,203,000 acres, showing a decrease of 4,948,000 acres as compared with the previous year. The decrease was largely due to the loss of export outlets for short-staple cotton as a result of Japan's entry into the war and the "Grow-more-food campaign" started on a country-wide scale. The total estimated outturn for 1942-43 was 4,702,000 bales, against 6,127,000 bales in 1941-42.

From the point of view of the grower, special significance attaches to the Seed Distribution and Extension Schemes of the Committee, as they form the real link between the Experiment Station and the cultivator. The total amount so far spent by the Committee on such schemes amounts to some Rs. 15 lakhs. During the period under review, there were seventeen seed distribution and extension schemes in operation in the various cotton growing provinces and States.

Here is what the Report has to say on a post-war policy for cotton :—

"Although it is difficult to forecast with any degree of accuracy what the requirements of the various markets for cotton after the war may be, it would seem desirable to lay down the broader principles that should be followed, so that research and extension work may be directed accordingly. India at present consumes annually over 6 lakhs bales of foreign cotton, mostly of staple above 1″, while the production in the country of similar cotton up to 1-1/16″ in staple amounts at present to only some 161,000 bales, and it may perhaps be well to consider whether the area under such varieties cannot be increased by the production, by hybridization or acclimatization, of suitable long-staple varieties that would meet the requirements of the Indian mill industry for such cotton. If this could be done, it may help to ease, to some extent, the position of medium staple varieties. Some very good progress in this direction has already been made in the Madras Province where the varieties Co. 3 and Co. 4, with staple length of 1-1/32″ to 1-1/16″, are making headway in the southern districts of the Province, the production in the past season being estimated at 19,000 bales. In the Punjab, too, there may possibly be further scope for increasing the area under Punjab-American 289F/K.25 and Punjab-American 289F/43. Whatever policy is decided upon, it is of the utmost importance that the requirements of the Indian mill industry which, as has been stated above, is the best customer of Indian cotton, must be constantly kept in mind and efforts made to cater for it as fully as possible. In this connection, it may be mentioned that recently there has been a phenomenal increase in the area under *Jarila ;* it may be well, at this stage, to make an estimate of the extent of the total requirements of the mills for this cotton, so that, if possible, the production may be regulated accordingly. The question may perhaps also be examined as to whether it is desirable that the crop in excess of the mill requirements should consist of such qualities as are least likely to come into direct competition with the rest of the cotton-producing world. Yet another question is whether a maximum limit on the total acreage should be placed, say, during the next five years."

Research

A number of research schemes, among which the most important are those for cotton breeding for the improvement of quality, are in operation in the various cotton growing Provinces and States. The majority of these schemes are financed entirely by the Committee, while the cost of others is borne partly by the Committee and partly by the Provincial Government or State concerned. Research on cotton technology is carried on at the Committee's Technological Laboratory. In addition, trained technological assistants are posted at the Cotton Research Stations at Lyallpur, Mirpurkhas, Cawnpore, Surat, Dharwar, Coimbatore and Parbhani, to help the botanists in charge in their work of breeding improved varieties of cotton.

Research on cotton technology and the testing of cotton fibres, yarns and cloth are carried on at the Committee's Technological Laboratory. There was a noteworthy increase in the use made by the cotton mills and firms of the facilities offered at the laboratory for making fibre and spinning tests. The total number of samples received for tests was 1,129, on which 234 reports were issued during the year. Fundamental research on cotton is carried on at the Institute of Plant Industry, Indore, which was established with the object of providing a central research station in the black soil areas of the Malwa plateau. In April 1940, the working of the Institute was reorganized as a result of which fundamental research on genetics and plant breeding, physiology and field plot technique is carried out under a special scheme, Cotton Genetics Research Scheme.

Wood Working for Textiles

Bobbins and Shuttles

BY "TIM. BOBBIN"

(*All Rights Reserved*)

A SHORT time ago there was a certain amount of controversy in the columns of the daily Press in connection with the subject of wood bobbins for textile purposes. In the July number of this *Journal*, extracts from papers read at the First All-India Textile Conference, Bombay, were published under the heading "Growth of Subsidiary Industries." These extracts prove that "bobbin making" in India has "got a move on," as follows:—

"Nearly 500 small and big bobbin factories have been established since the war started." . . . "Some of the factories have been established with big capital expenditure, and one estimate is that the total capital involved in bobbin manufacture is about Rs. 50 lakhs." . . . "With no knowledge of the skill and technique necessary to manufacture bobbins, so far approximately 191,000 gross of bobbins of different types, from slubbing to ring weft and Wadia pirns, and special types have been supplied to mills," at to-day's prices, approximately Rs. 1,15,00,000." . . . "Some of the manufacturers have no doubt designed their own plants for seasoning wood." . . . "The Forest Research Institute have done what they could to assist manufacturers in supplying suitable wood, but with little success." No wonder then at the controversy in the daily Press, aforementioned, which was mostly made up of complaints about the quality of the bobbins. In connection with the latter mentioned industries many new makers *are* now engaged in the work. Naturally there *will* be minor difficulties for a commencement.

The writer has been put in touch with a few of them who *have* encountered difficulties, and perhaps a few remarks upon such difficulties, and means of overcoming them may be generally useful. In the first place, the bobbins at first submitted for inspection and report were made for the ring frame spindles, and the outside workmanship was all that could be desired. The inside of a ring frame pirn, however, contains its "gripping" qualities or properties. It must be made to fit tight or "grip" the spindle point or tip for about half or three-quarters of an inch from the top downwards. The bottom of the pirn must sink easily into the cup that is on the spindle to receive it. It must never "*bottom*" this cup, thus always leaving space or distance for the pirn to sink lower as the gripping portion either wears or gets compressed to such an extent that sinking takes place. The operatives must be taught that the "waste" of yarn must *not* be allowed to "choke" or fill this cup, thus raising the pirn up on the spindle and preventing the gripping at the tip. The bobbins for "speed frames," either slubbing, intermediate or roving, are a much easier proposition to make and finish. The length and diameter are made to the sample, with a similar "collar" or swelling top and bottom. The hole or bore at the top is to give a nice easy fit to the speed frame spindle, and the bore at the bottom is to be made the correct size and shape to receive the creel peg upon which it has to work in the next process.

An important feature about these bobbins is the fact that they are not tight upon the spindles like the ring frame pirns, but are driven by the peg that is fixed in what is known as the "bobbin wheel." Herein lies a feature that *must* be observed strictly. The bottom end or rim of the bobbin is slotted in four places, one of which is to sit upon the above-mentioned peg, and these slots *must* be made to slip easily on to the peg (without being too "slack"). On the other hand, if these slots are too small to fit the peg, then the bobbin bottoms get broken and spoiled, owing to the "frame tenters," forcing them down upon the pegs. This spoiling of bobbin bottoms resulted years ago in the introduction of patented metal shields. Even with shields on, many bobbin bottoms get damaged. This is not the fault of the shields, but it is the fault of the pegs that are screwed or riveted into the bobbin wheels. Every care should be taken that the pegs are the right size for the bobbin slots. When pegs get worn away or broken, new pegs are obtained to replace them, *and sometimes these pegs are too thick* for the slot in the bobbin bottom. The frame tenter, however, " hammers " the bobbin down on to the peg, *and makes it fit*, spoiling both the bobbin and the peg. Care should always be taken that speed frame bobbins are of the correct diameter. The writer has discovered some speed frame bobbins that should have been of 1⅜" diameter to be actually 1½" and others 1¼", all working together; *this is fatal to good work*. Certainly the fault *in the first place* is in the making of the bobbins. If they are expected to be 1⅜" diameter, then 1⅜" they should be. In the second place, the fault lies with those who passed the bobbins into work.

Every new bobbin should be gauged previous to being passed into the storeroom of the mill; and any not correct should be returned to the maker. Another kind of bobbins known as warper's bobbins is in some respects much simpler or easier to make. They consist of two flanges, and a connecting length or barrel. The length of this barrel represents the " lift " and must coincide with the " lift " or " traverse " of the winding frames which have to fill them with yarn.

The diameter of the flanges must coincide with the gauge of the winding frame spindles, the gauge of the beaming frame upright creel, and the gauge of the doubling frame creel; that is, if all these machines have to be wound for.

Warper's bobbins do not present much difficulty in manufacture. The principal detail to notice is the making of the flanges, and their fixing. The fixing should present nothing new or difficult to the " wood turner." To prevent the flanges from " warping " or " twisting," however, it is usual to make them in sections, laying the " grain " of one section in the contrary direction to that of the other. The fixing medium, either glue or cement, should be waterproof in order to withstand the effects of moisture which the bobbins may possibly come in contact with (owing to " conditioned " yarn). One thing the writer would like to mention here. Wood bobbin making of any kind or type, always calls for *one* extra particular process in order to make a real success of it, and that is, *use well seasoned wood or timber*.

The writer had the privilege and pleasure several years ago of being shown through the works of one of the leading firms of bobbin makers in the world. Most of the machine tools were of the usual type used by " wood turners," and the possibility, *nay, the probability* was that the workers themselves were no more skilful than the majority of other wood turners. This firm, however, have a world-wide reputation for *excellence* of output. The Directors pointed out with pride, in a room (specially provided and fitted up for the purpose), piles of wood, cut into strips or blocks, for making the many types of their produce, and piled in a fashion that would allow the free and easy passage of air around every side, and end of the blocks. The wood in these piles had been there *seven years* and as one pile was removed it was replaced by another for similar work. We know that we cannot teach wood turners anything about the importance of " seasoning " their wood, but we may be excused for emphasizing *the importance of seeing that it is done*. We also know that there are many wood turners in India whose skill with *hand tools*, and also with *machine tools*, compares favourably with the workers of any other country in the world.

Over thirty years of practical daily oversight and advising of these workers, however, leave one with the impression that *strict oversight is necessary to keep things up to " concert pitch*." Again, it is not the workers who are to blame if they have raw material provided for them which is unsuitable for the purpose it is intended for. The writer cannot illustrate this phase of the subject and give figures showing the variations in bobbins owing to being subjected to different temperatures in the working stage; but in connection with the sister industry of shuttle making, he recently had to investigate a complaint of unsatisfactory shuttles. The accompanying particulars and figures, which he prepared for that case, may be of interest to wood workers in general, and also to shuttle users, and shuttle buyers.

Detailed Tests of 6 Shuttles

Acid-Resisting Metal in the Silk Industry

Notable High Silicon Iron

FOR high resistance to corrosion by acid and acid solutions, of outstanding interest for the textile industries, especially silk and wool, is a special metal made by Meldrums Ltd., of Timperley, near Manchester, England, which is not affected, for example, by sulphuric acid, nitric acid, acetic acid, chromic acid, oxalic acid, and many other acids, whether cold or at boiling point, and irrespective of the concentration. A special variety is also available which is resistant to hydrochloric acid.

Although, as with most acid-resistant and also heat-resistant metals and products, the full details are not available, it can be stated that "Meldrum" metal is a high silicon iron made by a special process. The firm have had an extensive experience in this field, dating from the last war (1914), and they have gradually perfected the metal until to-day satisfactory castings can be made up to 3 tons in weight.

The remarkable properties of silicon iron are, of course, familiar knowledge, but one of the difficulties has been to produce castings of considerable weight and size. In general, this special metal has an excellent heat conductivity and is extremely hard and durable, and much superior, therefore, to pottery and earthenware as regards withstanding changes of temperature and stresses. Further, it has the obvious advantage, as compared with any method of painting, coating, or enamelling, of being a uniform acid-resisting product right through, and therefore not affected, for example, by abrasive action, as well as changes of temperature already mentioned.

Again, the machined surfaces take a good finish by grinding so that the metal is particularly suitable for such purposes as spindles, and the ends of rollers in jiggers and other equipment for dyeing, especially with an acid bath. In the artificial silk industry, for example, cradles, pipes, and pipe racks when made of this metal can be immersed in the acid baths and left indefinitely, with no trace of corrosion. Also in a typical case a large jacketed pan made throughout of the acid-resisting metal, holding a ½-ton acid charge, has been heated for 2 hours every day for 50 weeks in the year for over 8 years, and there is not the slightest trace of iron contamination, although tests are made in this connection for every charge. Any tendency to even the slightest dulling of bright shades, whether in the silk or any other textile industry, by minute traces of iron is, therefore, eliminated by the use of this metal.

Boiler-house Efficiency

Further Hints on Fuel Economy

(*Specially Contributed*)

IF any really satisfactory progress is to be made in fuel economy, the following hints will be found very useful:—

It is essential that full records should be kept of consumption and cost if the engineering department is to be efficiently administered. Genius may afford to do without records, but ordinary ability cannot and even genius should not be trusted without them.

In order that the best results may be obtained from any boiler plant, it is necessary that the greatest care and attention should be paid to its cleanliness and to that end, the period and frequency of all cleaning operations should be based on certain definite periods of working. Unless this is done in a thoroughly systematic manner, results will be disappointing and no material improvement can be made in fuel economy.

The engineer must get every possible heat unit out of every pound of coal or oil that he burns and, to do this, it is his duty to have a constant check on combustion, the efficient use of the steam generated and the careful collection and return to the boiler of every drop of hot water he can probably retrieve. Boiler-house efficiency might be defined as being the ratio of heat usefully used to that contained in the fuel whether it be coal or oil or any other fuel.

Scale

Boiler scale has a highly insulating effect which reduces the quantity of heat transmitted through the heating surfaces of a boiler. The fuel loss by boiler scale can hardly be calculated except for special cases and with relatively little accuracy. On the other hand quite a number of tests have been made and proved by practical experience, showing the main influence which the thickness of scale has on this loss. The fuel loss for an average thickness of 1/16" scale is approx. 3.6 per cent. increasing to a fuel loss of almost 6 per cent. at an average thickness of ⅛". It will therefore always pay to keep the boiler clean and the heating surfaces free from scale.

Feed Water

The capacity of any boiler plant and its auxiliary should be such that it can be operated over the whole range of steam demand with the feed strictly equal to the rate of evaporation; this will result in the additional advantage of full heat recovery in the economizer. The practice of filling a boiler to the top of the gauge glass during the light load periods and allowing the level to fall over the peak demand is definitely wasteful. There is no doubt whatever that for maximum overall efficiency the water in the boiler should at all times be maintained at such a level that the maximum possible surface of water is exposed to the release of steam, this level being determined by the permissible minimum depth of water over the furnace crowns.

Economizer

Lancashire boilers, unless provided with heat-saving devices such as Economizers, are very wasteful on account of the high temperature at which the flue gases leave the last heating surfaces. If you have not installed Economizers, steps should be taken to do so immediately. If you have, however, done so, steps should be taken to check up that they are working properly. Check the inlet water temperatures and the outlet water temperatures from the economizer.

The type of economizer with which all steam-raising engineers are familiar is the one used in connection with Lancashire boilers. It consists essentially of vertical cast-iron tubes made up of sections of four, six, eight or ten tubes in parallel. The sections are connected at the top by plain branch pipes and at the bottom by access branch pipes, running lengthwise on opposite sides. The sections are contained in a brickwork chamber with the branch pipes outside. To keep the exterior of the tubes free from soot (the great enemy of heat transmission), scrapers, operated continuously by overhead gear on top of the brickwork chamber, move slowly up and down, and the dislodged soot falls into a pit formed by the brickwork foundations from which it can easily be removed. The scrapers on four sections of the tubes are operated by one pulley and hence the total number of sections in this type of economizer is some multiple of four. Blow-off and safety valves are fitted. Are your scrapers working properly ?

The economizer is erected in the main flue between the boiler and the chimney and a by-pass flue provided for the flue gases, so that the boiler plant need not be stopped when the economizer is out of commission for inspection or cleaning purposes. The by-pass flue is also used whenever the flow of feed water through the economizer is stopped. Failure to do this may result in the formation of steam in the economizer, and this is dangerous because this type of economizer is not designed for producing steam.

The feed water is pumped through the economizer on its way to the boiler, whilst the hot gases from the boiler pass through the economizer chamber, striking the vertical pipes at right angles and giving up the heat to them which they in turn transmit to the water by conduction. The water enters at the bottom and rises simultaneously and slowly, up all the tubes, and flows from the sections into the plain branch pipes at the top. The size of economizers required for a Lancashire boiler plant is determined principally by the amount of water evaporated per hour. To attain the highest efficiency it is advisable that the water capacity of the economizer should be equal to 1 hour's evaporation of the boiler plant.

The tubes of economizers used in connection with Lancashire boilers are mostly 9 feet long and hold about one cubic foot or 62½ lbs. of water. If the evaporation per hour is 6,000 lbs. per boiler, then by dividing 6,000 by 62½, we get the number of tubes required per boiler, and this equals 96. Another, but more approximate, method of arriving at the number of tubes required is to allow 5 tubes for each ton of coal burnt per week of 50 hours. Thus a boiler burning 25 tons of coal per week would require (25 x 5=125) 9 feet tubes, or, say, 128 tubes, this being the nearest standard size. Have you installed the economizers of adequate capacity ?

As stated above, a Lancashire boiler is a very wasteful steam producer without any economizer, but there are still unfortunately a large number of such boilers at work without such an appliance. Up to 15 per cent. saving in fuel can be shown and can be maintained by careful and methodical attention to the plant to avoid external and internal corrosion of the tubes, in leakage of air, etc. The feed water must not enter the economizer at a lower temperature than 110° F., or condensation of moisture with formation of sulphuric acid or sulphurous acid will take place causing rapid destructive corrosion of the lower ends of the pipes, especially at the cold end. The temperature of the water on the outlet end should be between 230° F and 280° F.

Feed Water Heaters

This type of appliance is designed to heat the feed water by means of exhaust steam, or in some cases, live steam. A feed water heater consists essentially of rows of tubes, through which the feed water to be heated is passed, the steam flowing outside the tubes in a suitable casing. Some heaters are fitted with tubes of special design which increase the efficiency of the heat transfer.

In cases where the quantity and pressure of the exhaust steam are not sufficient to warrant the introduction of special plant, all the exhaust steam from engines, pumps and process machines, together with condensed steam from steam traps, should be collected and led into the feed tank. Are you doing this? Precautions should be taken against contamination by oil and the feed taken should be lagged.

Lagging

In the national drive for fuel economy there is probably no single factor which is common to all industries using heat in its many and diverse applications and which can produce a greater saving in fuel, than efficient insulation.

The amount of saving in fuel by application of appropriate insulation to the proper thickness is greater than is generally appreciated.

The efficiency of insulation recommended is rarely less than 90 per cent. from steam pipe coverings which consists of about 85 per cent. magnesia and 15 per cent. asbestos fibre applied either in block form or as lagging. The following thicknesses for covering pipes are recommended—

Steam pipes, 120-160 lbs. pressure	2″
Steam pipes, 5-120 lbs. pressure	1½″
Feed pipes (all pressures).	1″ plus ½″ hard setting composition.

A single wrapping of asbestos rope can be readily applied to small pipe lines which are so often neglected. Are yours all lagged in this way? Pipe flanges and all bodies of stop valves should be lagged.

Unlagged Flanges and Valves

In lagging steam pipes it is a common practice to finish the lagging at a point 3″ or 4″ from the pipe flanges leaving the flanges uncovered. Generally this is done to make it easy to get the flanges. Two feet of unlagged 6″ steam piping carrying steam at 100 lbs. pressure will waste 5 tons of coal a year. Are your pipe flanges and steam valves lagged? How much fuel are you wasting annually in this way?

It can be shown that on a boiler plant working 24 hours a day at 160 lbs. pressure and 70 per cent. efficiency, during one year, one foot of 6″ diameter steam pipe covered with insulation of 90 per cent. efficiency will save 1,012 lbs. of fuel.

In general, great care must be taken to protect lagging from moisture and mechanical damage.

The cheapest method of protecting lagging is to wrap roof felting round it and to secure this with single strands of wire. Thus moisture is prevented from entering the lagging. There are several more expensive methods of protection which seal the lagging from the atmosphere and at the same time provide it with a more adequate protection against mechanical damage. These are usually compounds of a bituminous nature.

Slag Wool

This is a good insulant and is comparatively cheap but special care must be taken when installing it. It can be applied to hot surfaces having temperatures up to 600° C.

Magnesia

The cost of magnesia lagging is approximately the same as that of slag wool but the installation is probably easier in the case of large vessels and somewhat more difficult in the case of small pipes. It is more rigid than slag wool but should not be used on surfaces whose temperature is greater than 300° C.

Glass Wool

At temperature below about 300° C., glass wool has a greater thermal resistance than slag wool or magnesia. It is more expensive and cannot be used for temperatures greater than 500° C.

Asbestos

Asbestos is also a commonly used lagging material. There are certain types of asbestos which can only be used for lagging at relatively low temperatures (of the order of 150-200° C.). There are, however, better grades of asbestos which are of course more expensive but which can be used for higher temperatures (up to 600° C.).

Hot water from steam traps, drains and condensate is clean and scale-free and whenever practicable, should be returned to the feed tank or hot well.

Steam leakages, however small, represent a definite loss of fuel and should be attended to without delay. Check up that you have no steam leakages to-day.

Fuel Economy by Saving Electricity

Lighting.—Lamps, bulbs, and reflectors should be regularly cleaned. In the majority of mills in India, this is not done and the waste of current due to this is on average equal to 50 per cent. of the total current consumed for lighting. Is yours one of them? If so, appoint a permanent light cleaning staff to go round your mill once a fortnight. This is doubly important when electric lamps are in such short supply that they must be put to the best possible use and not wasted.

How to Get the Maximum Out of the Winding Frame

By TRILOKI NATH SHARMA

(Specially Contributed)

IT is an extraordinary fact that even after a century of the textile industry in this country, the optimum production of the weaving departments by textile mills is not achieved, with the result that production in this country is the lowest in the world, perhaps with the doubtful exception of China. It is indeed incomprehensible why one operative in the Indian textile mills is capable of looking after only five to ten automatic looms, while a Japanese operative can easily manage 25 to 60 looms. Is this deplorable and uneconomic position due to obsolete machinery, deficiency in the training of the operatives, inefficient supervision, and/or general lack of forethought on the part of leaders of the textile industry? Let us examine the position inside a typical Indian textile mill and establish the source of the present deficiency, going through the processes beginning from the winding frame and finishing with the cloth on the automatic loom.

A bobbin in the ring frame contains a relatively short length of yarn, depending on the lift and the ring diameter of the spinning frame for that length. The coarser counts have shorter lengths, and the finer counts longer lengths. Winding frames are employed to transfer the yarn from ring bobbins to the double-flanged warper bobbins. It is seldom realized that the size of the warper bobbin varies according to the count and quality of the yarn, with the result that one operative cannot look after more spindles than is usually the case in Indian textile mills to-day, and the number of knots in yarn, which is of vital importance to the weaving section, is unnecessarily and uneconomically increased. This could be easily avoided by the provision of suitable spinning and warper bobbins.

The sizes of bobbins recommended for different counts are given below.

Winding Frame

There are two types of winding frames in current use in this country for the production of grey cloth. They are: (1) Vertical spindle winding frame; and (2) side spindle winding frame. In the vertical spindle winding frame, the ring bobbins are fixed on a stationary skewer or peg, and the yarn is drawn through the top while the ring bobbin remains stationary. In the side winding frame the spindles on which the ring bobbins are fixed are placed in horizontal position. The spindle revolves and the yarn is withdrawn from the side of the bobbin. The tension on the yarn varies with the varying diameter of the bobbin from the top to the bottom, the higher tensions in this process preventing the winding spindle from attaining higher speeds. This is the reason why the speed of side spindle winding frame is about 700 to 900 r.p.m., while the speed of the spindles in the vertical winding frame is 900 to 1,100 r.p.m. The vertical winding frame is better than the side winding frame, in respect of production. It is always better to work

Sizes of Bobbins recommended for different counts.

	Size of ring bobbin				Size of warper bobbin			
Counts	Lift	Ring dia.	Bobbin dia.	Weight of yarn on bobbin	Flange	Lift	Bobbin dia.	Weight of yarn on bobbin
	Ins.	Ins.	Ins.	Ozs.	Ins.	Ins.	Ins.	Ozs.
Coarse ..	7	2	.781	1.72	4½	5	1¼	18
Medium ..	6	1¾	.684	1.29	4	4½	1⅜	12
Fine ..	5	1⅝	.635	1	3½	4	1½	6

spindles at lower speeds and have more spindles than work fewer number of spindles at higher speeds.

The spindles are placed in double rows and are driven by a tin roller of 5″ diameter. Since the front row of spindles are usually made with 1¼″ wharves and the back row with 1½″ wharves, the former rotate faster than the latter. The bobbins are half filled on the front row spindles and then transferred to slower running ones. The spindles revolve at a constant speed, while the rate of winding varies throughout. The larger the diameter of the bobbin, the greater the rate of winding. The tension on the yarn increases with the increase in the rate of winding and limits the speed of the spindles.

In order to have firmly built bobbins and to take out weaker places from the yarn, it is necessary to keep the yarn under sufficient tension. The tension depends upon the count and quality of the yarns. The coarser counts require more tension, and the finer counts less tension. It is very important to find out the exact degree of tension to suit different yarns. When too much tension is allowed, the yarn is stretched, becomes weaker and less elastic, and thus becomes unable to bear the strain in subsequent processes, especially behind the loom. It is here that good yarn is converted into bad yarn. Too little tension will not take out the weak places from the yarn, and the bobbins will be softly built. This also increases the breakages in the subsequent processes.

During the process of winding, every inch of yarn must be examined, and all weak places, bad piecings, slubs, snarls and motes taken out from the body of the yarn while retaining the elasticity. The yarn if properly looked after on this machine is conducive to higher percentage of efficiency and lower percentage of damage in the weaving shed. Unfortunately, many people do not realize the importance of attending to these vital details.

There are many types of clearers in the market, and many more have been devised by people in the line. Some clothe a wooden roller with card fillet, and the yarn is passed over the roller. The short fibres which are separated from the body of the yarn are embedded round about the passage of the yarn, and in most cases a bunch of fibre is taken away with the yarn. This cluster of fibre is further cemented with the yarn in the sizing, and breaks only when passing through the eye of the heald. Most mills in this country adhere to the very obsolete method of using an iron plate with one vertical slot to each spindle. The width of the slot is two and half times the diameter of the yarn. The yarn is passed through these slots, and it is claimed that by this method snarls, thick places, kinks, etc., are removed. But frequently short fibres cling to the sides of the slots and form a bunch which either blocks the passage of the yarn and breaks it, or is carried further along with the yarn, with the result that slubs are introduced into the yarn. The fibres are raised and the yarn becomes hairy, uneven and weaker, with the elasticity also taken away. There are many types of clearers which can be adjusted to suit the different kinds of yarn. These clearers clean the yarn without damaging elasticity. Very great care is required in selecting the most suitable type of slub clatchers and yarn clearers.

Traverse motion as applied to grey winding machines is regulated either by a heart-cam or a mangle-wheel. The traverse guide moves up and down at a uniform speed where straight bobbins are made, and in the case of barrel-shaped bobbins the traverse guide moves faster at the ends than at the centre to wind more yarn there. The straight bobbins are better, as the tension at the ends as well as at the centre remains uniform. This cannot be the case with barrel-shaped bobbins.

Just as the saying goes, "to card well is to spin well," it is equally true to say that to wind well is to weave well. It is deplorable that, while every other country in the world where the textile industry is efficiently organized is using modern high-speed automatic winders, we in this country are lagging behind and still cling to older types, which are uneconomical and do damage to yarn. It is time that Indian textile mills, particularly those which are under contemplation, must increasingly employ modern high-speed winders.

Supervision

Although the correct speed of a winding frame is a matter of expert judgment, it is a safe principle that spindles be run at slow speeds. Many a time when replacing a spindle or oiling the spindle, the operator does not care to see that the spindles are put in their own rows. This error increases the tension on the yarn. The bobbins when half filled should be transferred to the back row, for otherwise bigger bobbins in the front row will come in contact with the yarn which the back row bobbins wind round themselves. This causes extra breakages, and sometimes two ends are wrapped round one bobbin. To avoid the mixing of counts, it is necessary to mark the flanges with different colours representing different counts. Sometimes yarn at the ends is wedged between the flanges and the coils, with the result that it breaks when it is unwound in the warping creel. The winding machine should be cleaned at frequent intervals, in order to keep the passage of yarn scrupulously clean from short fibres and other impurities. Frequency of cleaning depends upon the type of yarn in use.

Mechancial knotters should always be used, and knotting by hand must be strictly avoided. The yarn may be kept under uniform tension and a tension meter may be used with advantage. The spindles should run concentrically. The relative humidity should be kept as near to the spinning room as possible. The best results are obtained by keeping humidity at 65 or 70 per cent.

Examination of Sodium Acetate

By S. M. NANAL, L.T.C.

(Specially Contributed)

ANALYTICAL books give a process of examination of sodium acetate which is rather out of reach of a mill laboratory. Hence a few simple tests are given below for the abovementioned chemical.

Whenever sodium acetate is dissolved in water the temperature of the latter falls. Sodium acetate is well ground to a fine powder. 150 gm. of condensed water are taken in a beaker. Its temperature is noted. 20 gms. of sodium acetate in fine powder are added to the above water and briskly and cautionsly stirred with a thermometer while noting the fall of temperature. In one case the fall was 8F°.

Now 20 gms. of powdered sodium acetate are exposed to warm air in a drying room till constant weight is obtained. The loss of weight which is equal to the weight of water of crystallization is 40 per cent. nearly.

Sodium acetate is used in dyeing for its property of replacing mineral acid by an organic one. Congo Red is turned blue by a mineral acid. If to a sodium acetate solution containing congo red indicator, sulphuric acid is slowly added, a point will be reached when red colour of the indicator will be turned violet. A volumetric test can be based upon the above results.

To 50 c.c. of condensed water, 1 c.c. of 1 per cent. Congo Red (Scales brand) solution is added and N/10 H_2SO_4 is run in from a burette till the red colour changes to a violet. In one case 0.2 c.c. of the acid was required. This beaker is kept as a standard for comparison of colour in subsequent titrations.

Now 13.6 gms. of sodium acetate under examination, i.e., a technical product, are dissolved in a litre of condensed water. This gives something like a N/10 solution of sodium acetate. Then 30 c.c. of condensed water are taken in a beaker to which 10 c.c. of the above sodium acetate solution are added followed by 1 c.c. of 1 per cent. Congo Red solution. Now N/10 sulphuric acid from a burette is run into the above acetate solution in the beaker till the colour of the beaker compares exactly with the standard beaker. When the colour is nearing the standard, acid should be slowly added in one or two drops and the whole stirred well before comparing with the standard. Comparison should be made by placing the beakers side by side on a white tile and looking at them from above. In one case 9.8 c.c. of N/10 H_2SO_4 were required for 10 c.c. of sodium acetate solution prepared as above. When 11 c.c. of acetate solution were taken, 10.4 c.c. N/10 H_2SO_4 were required. Whatever quantity of N/10 H_2SO_4 is required by the standard beaker (say 0.2 c.c. as above mentioned) is deducted from the titration of the acetate under test. From the above results it is visible that there is 4 per cent. error possible with the method. But better equipment and some improvement will still minimize the error. Anyhow this much accuracy is too much for technical purposes.

Modern Cotton Bale Opening and Mixing Room

Its Planning and Essential Features

BY SORAB DINSHAW, L.T.M., *Carding Assistant, Kohinoor Mills, Bombay*

(*Specially Contributed*)

IN the sketch given, two slightly different types of hopper bale openers and a Crighton opener with by-pass are shown connected in a series, followed by a pipe-line which commences at the Crighton opener, passes through to the mixing room, over the mixing stacks, then onwards to the dust filters via the exhaust fan. Two pneumatic delivery boxes (more can be installed if necessary) are shown fitted in the pipe-line above the mixing stacks. As the cotton enters the pipe-line after being opened by the preceding machines, it is drawn through the piping by means of the powerful exhaust fan into the required delivery box and deposited into the stack. Each delivery box serves any one of the two stacks on its either side, a swivel guide-plate being manipulated by hand levers in the necessary position for this purpose. The dust-laden air passes through the last box into the exhaust pipe and so to the exhaust fan and into the dust filters where impurities settle down in the bottom of the bags, and purified normal air escapes through the canvas filters back into the mixing room.

The layout described above is one of the many excellent arrangements possible for the bale opening and mixing room.

A systematic survey of the essential features of a modern, highly productive and efficient mixing room, which are also incorporated in the foregoing layout, is given below:

(1) *Automatic Feed.*— Preceding the line of the first bale opener is a creeper feed lattice which stops and starts automatically to regulate the amount of cotton passed forward into the bin. Similar automatic feed arrangement also exists to control the feed lattice of the second opener.

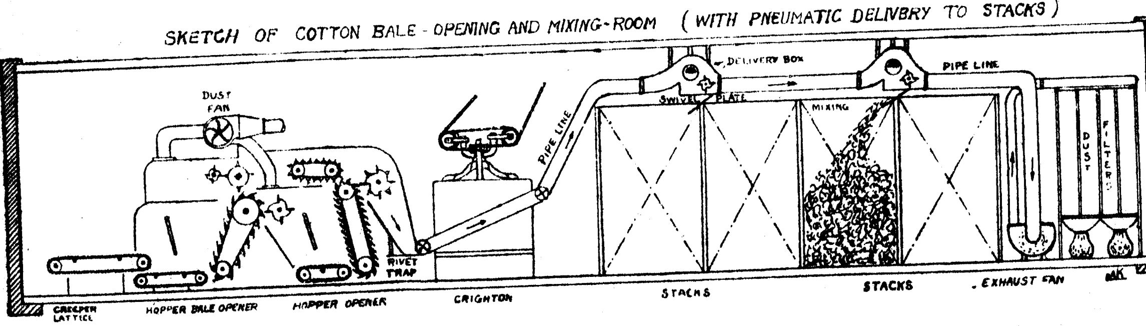
(2) *Combing rather than Beating.*— This is necessary in order to avoid damage to the longer fibre and is brought about by the spiked lattices and rollers and the introduction of leather flap beater. Spikes are finer in the second opener on account of the more opened state of cotton.

(3) *Uniformity.*— This is achieved by the parallel and equal adjustments of evener rollers and lattices.

(4) *Suitability.*— The plant must be suitable for anything from short-stapled, dirty Indian cottons to the higher varieties of American or Egyptian cottons. Hence a Crighton opener with by-pass valve is installed. Crighton is used when treating Low American or Indian cotton; otherwise it is by-passed.

(5) *Patent Rivet Trap.*— It is situated in a convenient place as shown and arrests any small solid matter such as rivets, small pieces of bale hoops, etc., which would otherwise escape forward only to damage the cages, grid-bars, etc., in the blow room or else licker-in wire or clothing in the carding engine.

(6) *Pneumatic System.*—In any present-day mixing room, the oldish crude method of conveying lattices must give place to the high-speed pneumatic method



SKETCH OF COTTON BALE-OPENING AND MIXING-ROOM (WITH PNEUMATIC DELIVBRY TO STACKS) of carrying cotton from opening machines to mixing stacks. Its principal features are: (a) *Flexibility.*—That is to say, it can be arranged in any conceivable position to suit the situation of machines and stacks. (b) *Impurity extraction.*—It is far greater on account of the exhaust fans and dust filters coming into play. (c) *Opening.*— Cotton is opened out more due to the fact that it is jostled about in its passage through pipes and the opening action of the delivery box. (d) *Ease of maintenance.*— Only attention needed is to the cage of the delivery box and the few bearings for oiling and greasing. (e) *Hygiene.*— By the pneumatic system the room is entirely freed from fluff and fly and thus it is conducive to operatives' health.

(7) *Controlled Air.*— The exhaust fans in the mixing room draw considerable air from adjacent rooms with adverse effects to the latter. Hence it is advisable to install a unit which will purify the dust-laden air from the exhaust fans and recirculate it in the room. For this purpose dust filters are provided, as shown in the sketch. In recirculating this filtered air, it loses some of its moisture which must be replenished. For this a small but effective air-conditioning unit, preferably of the water-spray type, must be installed. This will keep the atmospheric conditions of the room fairly constant and greater ease will be obtained in the subsequent processing of 'stack-conditioned' cotton from the mixing room.

The following useful data are given as a good guide:—

First opener:—	
Evener spiked roller ..	250 r.p.m.
Stripper..	500 r.p.m.
Delivery roller ..	500 r.p.m.
Dust fan	1,100 r.p.m.
Second opener:—	
Leather flap-beater ..	500 r.p.m.
Crighton opener	700 r.p.m.
Delivery box:—	
Cage	70 r.p.m.
Delivery roller ..	160 r.p.m.
Exhaust fan (for four delivery boxes).. ..	1,800 r.p.m.

Total weight of cotton delivered to stacks—1,500 to 2,000 lb./hour.

An opening and mixing plant with two openers, a Crighton, four stacks on either side, each 25 ft. × 10 ft., and exhaust fan with dust filters installed in a convenient corner, with sufficient space to store the running quantity of bales around the opening machines, will require a floor space 50 ft. long, 50 ft. wide, the height of the room being 15 ft.

Rules to Save Industrial Fuel

FUEL savings as high as 30 per cent. have resulted from adoption of a set of conservation rules by industrial plants, it was reported by Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., U.S.A. makers of control equipment.

The twelve rules developed by the company's engineers and based on experience in supplying controls to industry, included the following:—

1. Maintain the minimum permissible temperature in each section of an industrial building. For example, the office at 68 degrees, the machine room at 62, assembly room 65 and storage space 50. Remember that lower temperatures are more comfortable where manual labour is performed. 2. Maintain even temperatures in all occupied spaces and take frequent readings or recordings to be certain that these temperatures are being maintained. 3. Turn off the heat in unoccupied spaces or reduce the temperature to just above 32 degrees where freezing would cause damage. 4. Disconnect unused lines and radiation. 5. Reduce temperatures at least 10 degrees when space is not being used, such as at night. 6. Use ventilating fans only when absolutely necessary and reduce the amount of outside air taken in to a practical minimum. 7. Insulate all doors and windows and keep them closed except to maintain a minimum of ventilation required for the workers' comfort. 8. Remove anything which shields radiators, such as machines and cabinets, so that there will be no retarding of the flow of heat. 9. Have a competent heating engineer make a complete survey of the heating system and make any changes he recommends. 10. Employ a competent maintenance man to operate the heating system and make a complete survey of the system at least once a month. 11. Make every effort to obtain the co-operation of every one in the building to save fuel by keeping windows and doors closed and by reporting overheating —*American Exporter.*

On the Variation in Lint Characters Among Different Plants of the Strain Broach Desi 8*

By SRINAGABHUSHANA, B.SC., *Assistant Professor, Sri Krishnarajendra Silver Jubilee Technological Institute, Bangalore*

(*Specially Contributed*)

BROACH Desi 8 (for short B.D. 8) is an indigenous cotton, selected on the Government Farm, Broach, from among plants grown from the locally collected material, and well known in the Narmada-Mahi zone. The interesting story of its evolution is worth recording. Cotton in the Broach tract suffers considerably from the disease of wilt caused by the fungus *Fusarium vasinfectum*, which attacks the plants usually through the roots. Depending on the stage of growth of the plant at which the infection develops, the yield and quality of the lint produced are largely affected. The main task of the Broach Farm was, therefore, to evolve by selection from the local material or from hybridization a suitable type which, while resisting (or being immune to) wilt, suffered no deterioration in economic characters like yield or lint quality. Nearly a decade and a half ago, the officer in charge of the farm perceived that in a heavily infected patch of the field sown with seed from local selections, while almost all the plants had succumbed, one stood upright, unaffected by the deadly disease. It was immediately selected as a useful plant. The task of developing this was earnestly taken in hand. The yield of the plant was good. And a detailed examination of the lint revealed that it also had very desirable characters, a medium staple with good regularity, a low fibre weight per unit length with a high fibre maturity and small swollen diameter (a high intrinsic fineness). A laboratory spinning test disclosed the remarkable fact that with a mean staple of only about 0.92″, it spun to 40s—a phenomenal achievement for a tract which grows a type spinning up to 16s only. And B.D. 8 established itself. It was eagerly sought after in the wilt-affected areas.

However, before it could find favour with the cultivators all over the tract, two of its undesirable features had to be controlled. For one thing, it was a low ginner with only 32 per cent. proportion of lint, while the local yielded nearly 40 per cent. lint; and for another, its shorter staple compared with its spinning abilities came in the way of its fetching an adequate price, commensurate with its superior quality and sufficient to compensate for the low lint yield. The Broach scheme under the Indian Central Cotton Committee had, therefore, to grapple with the problem of evolving a variety which had a higher ginning percentage and a longer staple than B.D. 8, but with all its other desirable features of wilt resistance, fineness, regularity, maturity, etc. With this end in view several experiments have been in progress on the Agricultural Research Station, Broach, under the able guidance of Mr. P. L. Patel, Cotton Breeder, Broach.

One of the methods by which such improvement could be sought is by selection from B.D. 8 itself of off types which have the requisite characters, and development of the same. In this connection some preliminary work was, therefore, undertaken by the author (while in Gujarat) to survey the chances of such possibilities, as was done[1] in the case of 1027 A.L.F., the beautiful cotton grown in Surat-Navsari tract.

One hundred plants were selected on a random basis, ten each from ten rows from a compact area sown from pure selfed seed of the strain. Twelve rows were sown and to avoid border effects the first and last rows as well as the end plants in each row were rejected. Sowing was done on 30th June. By the end of January the bolls had commenced to open. On the 25th February the produce of each plant was picked and preserved separately obtaining a short pick of only such bolls as had opened in the particular week of intense ripening.

---

*This work was undertaken by the writer when he was Technological Assistant, Gujarat, Surat, under the scheme financed by the Indian Central Cotton Committee, Bombay.

These 100 samples were now examined for the four characteristics, boll content (weight of seed-cotton per boll), seed weight, lint index and ginning percentage. From the results, the frequency distributions of these characteristics among the samples and the corresponding frequency constants were calculated and are given in Table I, below:

TABLE I

Frequency Distributions and Frequency Constants: Boll Content, Seed Weight, Lint Index and Ginning Percentage

Boll content (gms.)		Seed weight (mgms.)		Lint index (mgms.)		Ginning percentage	
Mid-point of class interval	Frequency	Mid-point of class interval	Frequency	Mid-point of class interval	Frequency	Mid-point of class interval	Frequency

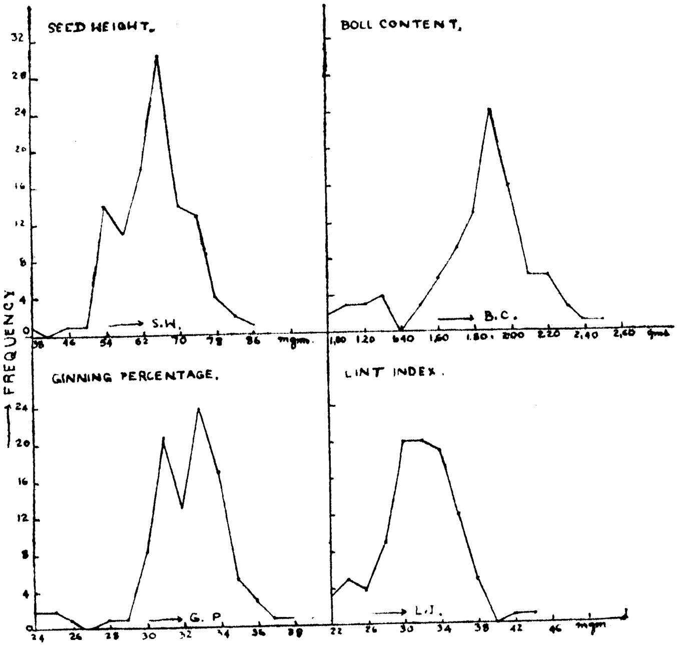
δ=Standard deviation.
C.V.=Coefficient of variation.
e_1 and e_2=Standard errors of g_1 and g_2.
S.=Significant.
N.S.=Not significant.

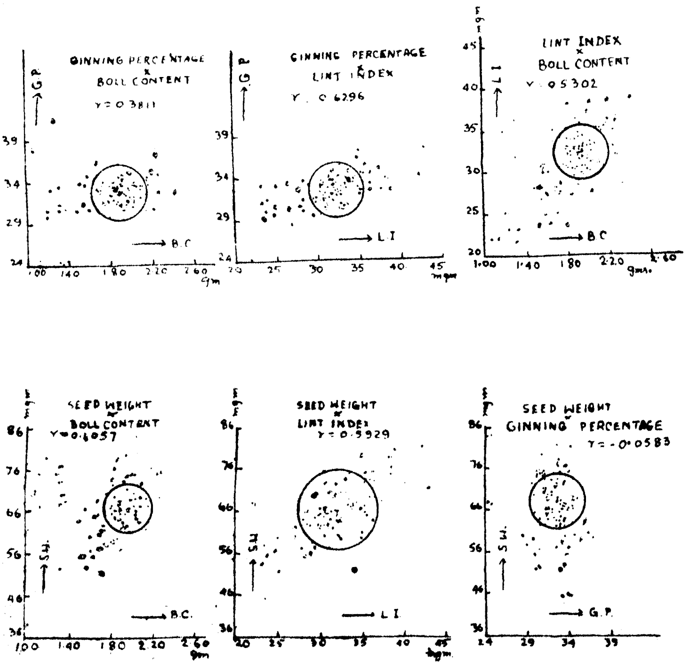
The relevant frequency polygons are also drawn in Fig. 1. The skewness was determined by calculating Fisher's g_1 and g_2 (g_1 is a measure of the asymmetry and g_2 indicates the nature of the central hump of the polygon). We observe that, for this population, the distribution is normal for lint index alone while it is negatively skew for ginning percentage and boll content and nearly so for seed weight, indicating that plants with higher boll content, ginning percentage and perhaps seed weight, are relatively greater in number. Further, ginning percentage which is a complex function of seed weight and lint index displays a skew distribution while the simple lint index is normally distributed, suggesting that the asymmetry of ginning percentage is probably due to the slightly skew distribution of seed weight. This also indicates that the development of the seed has been proportionately greater than that of the density of lint, which would account for the good fibre maturity of this type.

FIG. 1
FREQUENCY POLYGONS
(B.D.8)



In determining the fibre characters it was found necessary to reduce the number of samples. Accordingly only thirty samples were so chosen from among the hundred that the range of variation amongst these was very narrow for all the four characteristics already determined. Accordingly six scatter diagrams were drawn for all the four characters taken two by two, like seed weight and boll content, seed weight and lint index, etc. (Fig. 2). Then, by drawing a circle in the region of the maximum concentration of the dots in each of the figures and selecting those common to all the diagrams in the marked regions, the thirty samples were chosen, to discover the range of variation, the fibre characters would display among these wherein the variations in some other characters were deliberately restricted.

FIG. 2.
SCATTER DIAGRAMS
(B.D.8)



Incidentally, these diagrams also reveal the strength of association between the characters among plants of this strain. The actual coefficients of correlation—total and partial—are calculated and given in Table II, below, along with their significance.

As can be seen therefrom and from the diagrams (Fig. 2), the total correlation is fairly high between seed weight and lint index as also between ginning percentage

TABLE II

(1) b = boll content
(2) s = seed weight
(3) l = lint index
(4) g = ginning percentage

Total Correlations

$r_{bs} = 0.4057$
$r_{bl} = 0.5302$
$r_{bg} = 0.3811$
$r_{sl} = 0.5929$
$r_{sg} = -0.0583$. N.S.
$r_{lg} = 0.6296$

I. Order Partial Correlations

$r_{bs.l} = 0.1336$. N.S.
$r_{bl.g} = 0.4040$
$r_{sl.b} = 0.4873$
$r_{lg.s} = 0.8262$
$r_{bs.g} = 0.4635$
$r_{bg.s} = 0.4437$
$r_{sl.g} = 0.8119$
$r_{sg.b} = -0.2520$. N.S.
$r_{bl.s} = 0.3934$
$r_{bg.l} = 0.0718$. N.S.
$r_{lg.b} = 0.5454$
$r_{sg.l} = -0.6901$

II. Order Partial Correlations

$r_{bs.lg} = 0.2539$. N.S.
$r_{bl.sg} = 0.0531$. N.S.
$r_{sl.bg} = 0.7703$
$r_{bg.sl} = 0.2287$. N.S.
$r_{lg.bs} = 0.7907$
$r_{sg.bl} = -0.7081$

N.S. = Not significant.

and lint index. Between seed weight and ginning percentage, however, the association is very weak.

Of the twelve first order partial coefficients three indicate a rather weak association. The low negative correlation between ginning percentage and seed weight improves considerably on eliminating the effect of boll content and lint index, lower seed weight being well associated with higher ginning percentage, as might be expected.

All the three second order coefficients between boll content and seed weight, lint index, and ginning percentage, are not significant, showing that the size of the boll has no appreciable effect on the other three characters considered. However, the partial correlation coefficients $r_{bs.lg}$ and $r_{bg.sl}$ are nearly significant. Besides, the partial correlation between seed weight and lint index is as high as 0.7703, showing that heavier seeds bear relatively more lint which explains the good fibre maturity of B.D. 8. Ginning percentage and lint index are positively correlated, both being measures of available lint. But while seed weight is positively associated with lint index it is equally strongly negatively associated with ginning percentage, high seed weight thus indicating high lint index but low ginning percentage. Thus the formula for ginning percentage =

$$\frac{\textit{lint weight} \times 100}{\textit{lint weight} + \textit{seed weight}}$$

while increase in seed weight would increase both the numerator and the denominator, the ratio, however, would decrease. In other words, while heavier seeds would bear more lint, the rate of increase of seed weight would be greater than that of lint weight; which also indicates a high fibre maturity.

The samples of lint from the 30 plants selected as above were examined for the three important fibre properties, length, weight and maturity. The fibre properties were determined by the methods usually adopted at the Technological Laboratory, Matunga. Two Balls sorter tests for length, counting and weighing 2,000 fibres for weight and examining 500 fibres for maturity, were done for each sample. From the fibre length distribution values the irregularity percentage was calculated. From the values of fibre weight and maturity Standard Hair Weight was calculated according to the formula given by Peirce and Lord.[2]

The mean results, the range of values and the coefficients of variation for these 30 plants for all the properties measured are given in Table III, below.

While we observe therein that the mean length ranges from 0.89″ to 1.00″, actually 29 plants lie in a narrow range of 0.89″—0.95″ only, showing that the length range promises little variety for selection. However, it would indicate that if by chance normal plants with longer staples are found there are reasonable possibilities of developing it. Similarly in fineness, while the range is from 149 to 182 units, except for two plants with 149 units, the rest vary between 162 and 182 units only —a very narrow range. This is further emphasized by the values of standard hair weight. Here too, therefore, the variation is not distinctly far from what may be

TABLE III

No.	Property	Mean	Range	Coefficient of variation %	Remarks
1	Boll content (gms.)	1.92	1.80–2.08	4.0	
2	Seed weight (mgms.)	65.81	61.3–71.2	3.6	
3	Lint index (mgms.)	32.20	29.5–34.3	5.0	
4	Ginning percentage	32.83	31.1–34.6	3.0	
5	Fibre length (inch)	0.92	0.89–1.00	2.6	(*)
6	Irregularity percentage	8.31	6.1–11.2	13.7	
7	Fibre maturity count	74–11	65/18–82/8	..	
8	Fibre weight (10^{-6} ozs. per inch) ..	0.169	0.149–0.182	4.7	(†)
9	Standard hair weight (10^{-6} ozs. per inch) ..	0.167	0.153–0.177	3.6	

* One of 1.00″, rest between 0.89 and 0.95 inches.

† Two of 0.149″, rest between 0.162 and 0.182 units.

expected from random sampling. The distinctive character of B.D.8—a combination of the very desirable features of intrinsic fineness, low fibre weight with very good maturity (a low standard hair weight) and regularity of staple (as indicated by low irregularity percentage)—is clearly shown by these results. Their intergrated effect is manifested in its high spinning value of 40s. Its theoretical spinning value from Turner and Venkataraman's[3] formula is 33s, and by Ahmad's[4] formula 40s.

These results show that for B.D.8, the restriction of selection of plants to those with small ranges of variation in four characters (of 0.28 gms. in boll content, 9.2 mgms. in seed weight, 4.8 mgms. in lint weight per seed and 3.5 per cent. in ginning percentage) has resulted in a restriction of the variation in their fibre properties also to a small range. Hence, for this strain the lint characters appear well fixed so that the variation among different plants, selected as explained above, are not so wide as to offer a large scope for improvement by selection from within. At the same time the narrow ranges point to an interesting probability that if among plants of this strain a few with much better staple and higher ginning, beyond the limits herein found, are discovered, developing favourable types from them would be possible.

The writer is indebted to the Indian Central Cotton Committee for permission to conduct the investigation, to the Cotton Breeder, Broach, and his staff for supply of material and to Dr. Nazir Ahmad, Director, Technological Laboratory, Bombay, for useful guidance.

Textile Production in Catalonia.—The cotton textile industry, centred in Catalonia, is probably the largest manufacturing industry in Spain. It is made up of several hundred plants, most of which are relatively small. There are about 1,900,000 spindles and 59,000 looms. Prior to the Spanish Civil War, consumption of raw cotton averaged between 390,000 and 400,000 bales annually. Practically all varieties of cotton textiles are produced. During the past year the industry has been much more active as a result of larger receipts of raw cotton from abroad.

Spain's woollen industry, which dates from the very earliest times, also is located principally in Catalonia and is an important factor in the economic life of the nation. There are probably around 300 weaving and spinning mills, mostly small or of medium size. Most of the raw wool used is normally produced in Spain.

Society of Dyers and Colourists Celebrates Diamond Jubilee

Speech of Dr. Henry Dreyfus

THE following are extracts from the address of Dr. Henry Dreyfus, Chairman and Managing Director of British Celanese Ltd., to the Society of Dyers and Colourists on the occasion of the celebration of the Diamond Jubilee of the Society held at Bradford on the 24th March, 1944. In 1938 Dr. Dreyfus was awarded the Perkin Gold Medal of the Society.

Everybody knows from what small beginnings the Society of Dyers and Colourists sprang. A small group of young men interested in the dyeing and finishing of textile fibres and in the manufacture of dyestuffs met sixty years ago with the object of forming a society to "watch over the progress of textile colouring abroad and promote and encourage the science of dyeing," which they considered to be "an absolute need of the times."

Since then the Society has most successfully progressed and grown up to the present time. It has radiated its wisdom and knowledge in the science and practice of dyeing and dyestuff-making, not only for the benefit of England, but for the benefit of the world at large, and for this reason has acquired a world-wide reputation.

The Society is fortunate in still having as its members two of the original founders, Mr. George Douglas and Mr. H. Grandage. It celebrated its fiftieth anniversary in 1934.

Continuing, Dr. Dreyfus observed:

"When we look back upon the early stages and consider the narrow conception which existed of dyeing and colouring and of dyestuffs manufacture in the industrial world of that time, and then consider the conception which we have of that industry to-day and of the other industries which it embraces, we see clearly the interconnection which exists between a multitude of industries and the products made by them such as dyestuffs, ranging from real to—may we call them—colourless dyestuffs—the latter, for example, in the form of finishes which are imparted to textiles, and the various effects resulting therefrom.

"In addition I may mention that whilst dyestuffs and their intermediates were previously manufactured, and in this connection an enormous amount of scientific and technical work was done over a very long period of time in order to be able to dye efficiently and with the greatest degree of fastness natural textiles such as cotton, wool, natural silk, etc., the newest trend over the last ten to twenty years has been for pure chemistry as such, as well as in its applications, to be used in order to create synthetic textiles of various kinds, whether built up from cellulose which, based on yearly growth, is virtually inexhaustible, or from coal, which itself may have originated from cellulose. The same chemistry and its applications were used in olden days for manufacturing dyestuffs. A choice was made amongst their intermediates in colourless and/or coloured form. In other words, one uses either chemicals to make dyestuffs to dye synthetic textiles, or one can use in order to make textiles some chemicals which were previously supposed only to be used for dyestuffs. May I add that the dyestuff industry has developed to such an extent that it has for some considerable time overlapped in many ways the realm of pure chemistry, including pharmaceutical and general chemistry. One knows to-day, in view of the progress of science and industry, dyestuffs which can be used for medical purposes. The same raw material may be used in the future—to mention a few examples—for transformation into a synthetic dyestuff or into rubber or into resins or into a textile. This applies in particular also to explosives, for example, T.N.T. Even the famous diazo solutions, which were the basis for one of the greatest developments in the dyeing and colouring industry and the dyestuffs industry are, when isolated, violent explosives.

"It may also be of interest to observe that since the date of the inception of the Society, and for some time previously, efforts were mainly directed towards finding the dyestuffs which were needed for dyeing the existing natural textiles. However, mainly since the last war, great efforts have been made by many people to evolve dyestuffs for the synthetic textile fibres which have been produced since that time. This was an easier task, as most of these fibres could be dyed with cotton dyes, subject to certain adjustments of quality.

"Subsequently, the development took place of the synthetic textiles which had attached to them chemical organic radicles, starting from cellulose as raw material, followed later on by synthetic textiles, starting from coal, which I mentioned before. In order that the usefulness of these products might be established as an industry, it was necessary to develop new dyestuffs of many kinds, and it so happens that all the before-synthesized textiles can in principle be dyed with dyestuffs such as have already been established for cellulose acetate silks.

"It may also be interesting to mention here that many dyestuffs have been created for many technical purposes, in view of the manifold new technical developments which have taken place in various other branches of industry. It is remarkable to notice to what degree the dyeing industry, and in particular the dyestuff-making industry, has developed, so that to-day we are able to build up scientifically dyestuffs of certain qualities for many industrial and other purposes with certain desired solubilities, fastnesses, etc., as required from case to case—just as we are in a position to-day to synthesize textiles, and impart to them most surprising qualities. For example, nobody would ever have thought that it would be possible to produce synthetically textiles three or four times as strong as natural silk, and yet this is now an everyday fact.

"Before 1884 the main raw materials for dye-making, apart from the natural dyes which existed then, were benzol, toluol, naphthalene and a few others. These products were expensive at the time, and were by-products of the gas industry. It is interesting to note that whilst these products are still derived as by-products, such large quantities are wanted to-day for such a large number of purposes, including explosives, dyestuffs and synthetic textiles, to mention only a few—that the quantities derived from the old processes are not sufficient, and have not been sufficient for some time. As the demand was created by the evolution of the activities of the various industries, new ways were found for meeting it ; for instance, petroleum or synthetic oil from coal was and is used for producing such products. In the last war, even, carbide was used to form acetylene, which in its turn was transformed into benzol and other products by many known processes. In other words, if necessity should arise the one product could be transformed into the others.

"I specially mention this because we are now in the coal and oil age. If you will cast your minds back to the period just before the steam engine was invented by Watt in our country you will remember that coal was not used to anything like the extent at that time. As a result of the invention of the steam engine, the coal industry has undergone enormous development, and the consumption of oil and coal has now increased to such an extent that people are already speaking of a shortage of oil and coal, and, to judge from the Press and scientific periodicals, some measure of anxiety seems to exist as to what may happen when oil and coal become scarce. That time is a long way off, and anyhow, I do not think we need despair for the future. Generally nature is so kind to us that if we know how to flatter her and make use of her, based on our scientific and technical evolution, the materials reappear in other forms for our use, provided we adjust ourselves to such use by taking the necessary industrial dispositions at the proper time. Suppose there were no oil, we should still have large supplies of coal. Coal is said to be in abundance, and yet it is said that coal also may be used up at a relatively early date. Suppose there were in time neither oil nor coal, we should make a virtue of necessity and produce electricity, for example, with water power, especially that derived from the tides and hence the motive power for which coal is used could, if sufficient time were allowed for the changeover, be replaced. So far as vehicles and aeroplanes are concerned, the storage of electricity would be developed and new inventions would be stimulated to satisfy the eventual requirements. In fact, electricity produced by water power would, on the principle of electrolysis of water, produce hydrogen, which itself could be used as motive power, and here again the storage of such motive power for vehicles and aeroplanes would stimulate the inventive geniuses at that time.

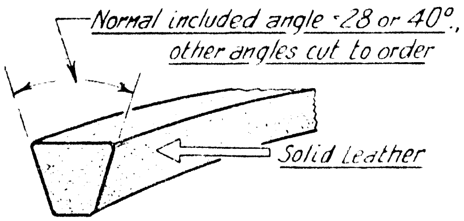
"Before the last war the dyeing and dyestuff industry was not in a happy position in this country. Many difficulties, not to say adversities, had to be met by the firms who were then occupied in this industry. The reason was that the general laws, including the Patent Law, in force in our country at that time not only did not favour but seriously hampered the development of industry at large, and in particular of your dyestuff industry. The principle of Free Trade prevailed, and the most-favoured-nation clause, with all its drawbacks, was in force. These principles had an adverse effect on this industry, inasmuch as no protection was afforded to enable its efficient development and maintenance, and to secure it from outside interference. Only when the last war broke out was the importance of the dyeing and dyestuff industry realized, in view of its close connection with many other industries, such as the explosives industry, and the chemical industry at large, which are vital in times of emergency. After the last war, the necessary steps were taken by the Government, and far more efficient and proper protection was provided for in a combination of ways.

"One of the best examples, from an objective point of view, of how a nation can develop and become the first expert in a particular industry is provided by the U.S.A., for example, in the development of the natural silk industry there. (This industry once flourished in our country but was reduced to a bare existence owing to the fact that no support was given to it by the Government of that time, probably due to Free-Trade ideas which were then the main principles of political aspirations.) Over a long period of time, and based on relatively high protection, the U.S.A. were able to establish this industry according to the principles which then existed in our country and in Europe, and they were able to improve upon it and develop it so efficiently that before the last war, and subsequently, they consumed about 80 per cent. of the whole of the existing natural silk production. The effect of this was that a large number of industries were created and developed there, and the fact of taking part in this successful development obviously imparted to the people such knowledge and science and technique and designing and fashion and style, that the U.S.A. have become first experts on natural silk textiles, including the art of weaving, dyeing, finishing and printing. This had its influence on the education and the popular taste of the masses, and particularly of the fair sex, who developed a taste for natural silk clothing—both underwear and outerwear—coupled with a sense for fashion and fashion changes and creations very close to that which existed in France, if, in fact, it did not surpass it.

"In our country, where the natural silk industry has never developed to a substantial extent owing to the difficulties mentioned before, the artificial silk industry has fortunately gradually developed to a stage where artificial silk products can be used for superior articles to replace natural silk. It has, however, been more difficult to establish it here from a time point of view than in the U.S.A., where the existence of the natural silk industry was of substantial assistance. This applied to the period after the last war and up to date, and one can now say without hestitation that most, if not all, artificial silk products can be made superior to natural silk products if they are really needed for particular purposes, in view of the adaptability of the qualities of the synthetic textiles to the various requirements."

Benson Leather V-Belts

LEATHER arranged in the form of flat continuous bands and used as the medium of transmitting mechanical power of large magnitudes from one source to another needs no introduction since this method appears to have its origin in antiquity ; leather made up into small cross circular bands has also been employed for a considerable period as a means of transmitting relatively small powers but the application of solid continuous strips of wedge-shaped or trapezoidal section leather suitable for replacing V-belts of rubber and textile fabric construction manufactured by **The Benson Vee Leather Co., Ltd., Longside Lane, Bradford, Yorks, England,** is of recent origin and represents an innovation of paramount importance to all engineers.



Belts can be supplied endless with the joint cemented or coils can be supplied for cutting to exact length on site and joining with patent fastener

As is already well known, V-belts have achieved a steadily increasing rise in popularity as a means of transmitting mechanical power with the result that this form of drive constitutes one of the principal methods of driving every conceivable type of machine ; the reasons for the increasing use of V-belt drives is due to a large extent to the fact that they possess all the advantages of flat belts with the additional ability to operate successfully on extremely short centres—an important feature where space is limited.

The type of V-belt composed of rubber and textile fabric is usually moulded endless to suit a wide range of sizes and lengths, the lengths or circumferential dimensions of the belts are, of course, limited because of the extra cost entailed in carrying large stocks of special moulds, and on this account, the user has often to design his drive to suit the maker's predetermined sizes, a procedure that might not always be a convenient one.

The claim is sometimes made that the absence of a joint is an advantage in so much that the endless belt promotes a steadier drive and ensures uniform strength throughout ; there are, however, occasions where an endless belt can be a disadvantage, particularly if it means that due to this feature, the pulleys have to be overhung or modifications made to the machine in order to facilitate the fitting of the belts without having to partially dismantle the machine.

The " Benson " V-leather belt can be supplied in any section or angle either in the form of endless belts or in rolls of 20, 50 or 100 feet long for cutting to precise lengths on site and joining by a simple yet efficient type of metallic fastener, thus every disadvantage of other types of V-belts is overcome.

" Benson " V-leathers are stocked as endless belts to suit all standard circumferences in the following sections :—$1\frac{1}{2}'' \times 1''$, $1\frac{1}{4}'' \times \frac{3}{4}''$, $\frac{7}{8}'' \times \frac{5}{8}''$, $\frac{21}{32}'' \times \frac{7}{16}''$, $\frac{1}{2}'' \times \frac{5}{16}''$ and $\frac{3}{8}'' \times \frac{7}{32}''$, and whilst the normal included angles are 28° and 40°, any special angle, section or length can be readily supplied against specification in view of the fact that the manufacture of this type of belt does not involve any moulding operations.

The makers have installed in their works special machinery for pre-stretching the belts before despatch ; this ensures that when the belts are received by the user, they are suitable for immediate installation on fixed centre drives without the need for take-up due to stretch.

When the belts are made endless at the maker's works, the joints are spliced and cemented with a special waterproof plastic capable of withstanding the effects of contact with the majority of liquids used as coolants in machine shop operations, the same type of cement or suitable

(*Continued on next page*)

"Plioflex"—A Substitute for Rubber

A PLASTIC automobile tyre that has run 8,000 miles raises the possibility that the anticipated post-war competition between natural and synthetic rubber may become a triangular battle-royal among all three.

The story of the new tyre was recently revealed by executives of the Goodyear Research Laboratory, in Akron, Ohio, U.S.A.*

The tyre just tested is the third one to be made from Plioflex, the new elastic plastic dveloped by scientists of the laboratory. The perfection of Pliofiex was first announced last year at the time of the dedication of Goodyear's new Research Laboratory in Akron. Since then a wide variety of applications of the material have been investigated of which its possible use for automobile tyres is only one. Plioflex represents an important advance and a radical departure in the field of plastics in that it is the first elastic plastic capable of being vulcanized during moulding operations. It can be handled in hot moulds exactly like natural rubber. The tyres and other objects made so far from Plioflex have been turned out with the aid of standard equipment regularly used in the making of articles from natural rubber.

The statement emphasized the fact that the tyre which ran 8,000 miles was only the third one made from the new material and that the scientists of the company are certain that they can improve greatly upon it. Whether or not the future will see a demand for plastic tyres depends upon many factors, it was stated, among them being the developments that may occur in the fields of natural and synthetic rubber. Company scientists were busily engaged in researches on synthetic rubber prior to World War II and the company is now operating its own plants and plants for the Government, but the company's thought is that every possibility ought to be investigated and the tyres of the future made out of whatever material will produce the best tyres at the lowest cost to the consumer.

The Plioflex tyre under discussion was what is known in the automobile industry as a 6.00-16 tyre of four-ply material, the sort of tyre suitable for a light car. It ran 8,000 miles in actual road tests. Scientific studies carried on during the road tests showed that the carcas and treads reached maximum temperatures only slightly higher than those reached in tyres of natural rubber and much below the temperatures developed in tyres of GR-S, as the Buna S type of synthetic rubber is now known.

While only time and further studies will determine the value of Plioflex for automobile tyres, there is ample demonstration of the usefulness of the new material in a wide variety of other applications. Tests have already demonstrated that it is superior to natural rubber in one immensely important aspect. It is not affected by the sun's rays. It is a well-known fact that natural rubber is highly sensitive to the ultra-violet radiation of the sun and for this reason the life of many rubber products is greatly shortened by exposure to the sun. This defect of natural rubber creates many problems. Thus, for example, in the construction of automobile bodies where moulded natural rubber is used for weather-stripping on the windows it has been found necessary to provide metal coverings to protect the rubber. Weather-stripping of the same type has been made successfully from Plioflex in the Goodyear Research Laboratory. Since it is resistant to sunlight, it can be used without any metal protection.

One of the most important uses foreseen for Plioflex as a result of this resistance to the sun is a new garden hose. The Goodyear Research Laboratory has produced a light-weight, flexible garden hose of Plioflex so light that any child can easily pull it around a lawn. Because the material will not crack in the sunlight, it is possible to make the hose without the inclusion of fabric which adds to the weight and awkwardness of the ordinary garden hose. In addition, the new garden hose can be made in any colour of the rainbow.

A display of Plioflex samples in the Goodyear Research Laboratory shows that the new material can be used for a great variety of automobile and electrical parts now moulded from rubber, for all sorts of hose and tubing, for the heels and soles of shoes, and for coated fabrics and papers.

It is expected that many of these fabrics will find uses in the upholstering of furniture, for luggage, raincoats, other clothing, wall coverings, draperies, book-binding, insulated wire, jar rings, etc.

The material has proved so successful for heels and soles of shoes that the company could use 100,000 pounds of it a month for this purpose if war priorities did not make it impossible to get the necessary raw materials.

Plioflex can also be made in finishes that resemble leather and one possibility is a Plioflex shoe with uppers made from the material as well as soles and heels. Such uppers would be unique, scientists of the laboratory say, in that they would require no polishing, merely wiping with a damp cloth.

As already indicated, the chief problem with regard to Plioflex at the moment is to obtain the raw materials from which it is made.

Benson Leather V-Belts

(Concluded from previous page)

fasteners can be supplied to users desirous of making their own endless belts at site.

The installation of this type of leather V-belts is an affirmative answer to the request for everyone to conserve rubber and provided their use is for work of national interest, no permit is required before they can be supplied and, further, where the belts are for use on machines for export, the necessary licence is readily granted.

The Indian Cotton Year, 1943

Bombay Millowners' Review

THE following are extracts from the report of the Millowners' Association, Bombay, for the year 1943:—

The I.C.C. January opened on 5th January at Rs. 415½, March Rs. 411 and May Rs. 417, March New York on 2nd January at 19.22: cross rate 4.03¾, and parity 351 points below New York. The third Indian Cotton Crop Forecast at 44,38,000 bales showed a decrease of about 19 per cent. under the previous year. Arrivals in the up-country markets were heavy, and this, with air raids over Calcutta during Christmas week, brought some nervousness in the market, and prices declined to Rs. 399 on the 7th. Transport difficulties were still there, and hence cotton could not arrive freely into Bombay. Mills were continuous buyers of all staple varieties of cotton, and prices, therefore, improved steadily to Rs. 426 on the 19th. Finally, January contract closed at Rs. 432. This contract, as it stood, was yet in an experimental stage, as for the first time it was based on the length of the staple. Total tenders during January were 22,650 bales.

February showed a still rising tendency and prices for March which were Rs. 396 on the 19th January, rose sharply reaching Rs. 510 by the end of the month.

In the first week of March, prices rose to Rs. 570 on the 4th owing to demand for cotton from mills. After a temporary decline to Rs. 542 on the 8th, the market again took a sharp upward trend, prices touching Rs. 647 on the 12th. Tenders during this month were negligible. Prices, however, began to sag, and the contract stood at Rs. 544 on the 23rd. The rise in cotton was in consonance with the general rise in prices of commodities. With a small Indian cotton crop partly owing to the "Grow-more-food" policy of Government itself, and restriction in imports of foreign cotton, with mills working day and night, a big rise in price was to be expected. Cloth and yarn prices rose four to five times the pre-war rates, and cotton only followed this rise though late. March contract closed at Rs. 556 on the 25th. The total bales tendered against this contract were 7,800. Parity with New York, where prices ranged between 19 and 20 cents, was now about par.

Prices for May went as low as Rs. 512 on the 29th, but on the very next day they rose to Rs. 544. April's first half showed fluctuations both ways, lowest touched being Rs. 515 and highest Rs. 551. After that, prices more or less steadied, ranging with narrow fluctuations round about Rs. 550. But towards the end of the month, prices rose to Rs. 608 on the 26th and remained steady with a small decline.

In the month of May, prices kept a steady tone between Rs. 575 and Rs. 600 for some days, but from the 14th, prices began to rise, May touching Rs. 660 and July Rs. 673 on the 17th. Parity again stood at 500 points above New York. This abnormal rise in such a short time with wild fluctuations daily forced Government to issue a *communique* on the 20th May, prohibiting all trading in futures. The July contract was cut at Rs. 568. Total tenders during May were 5,900 bales. Prices for ready cotton could not be maintained, and gradually began to fall in the absence of buyers. Good business had, however, been done in New Crop, N.T. Sind beginning from Rs. 740, but there were more sellers than buyers and so prices could not be maintained and a steady drop of Rs. 150 was registered in this delivery contract. Foreign cotton was also affected. Some business was done with Liverpool and U.S.A. for Sind Deshi and 4F.

On the 9th August, the U.S.A. Agricultural Bureau Report showed an estimated crop of 1,25,58,000 bales, as against 1,28,24,000 bales of the previous year. This figure was reduced to 1,14,78,000 bales later on.

Forward Market Allowed to Function

After a long interval of several months, the forward market in Bombay only was allowed to function by Government, on the 28th of October, with some safeguards imposed in consultation with the Cotton Committee of the Textile Control Board. Normal trading was allowed with a ceiling of Rs. 550 and a floor of Rs. 400. A deposit of Rs. 25 per bale was to be placed with the East India Cotton Association by each member on his net open position in weekly clearings, to check wild speculation. Options were strictly banned, and the Association was authorised to expel any one disobeying by-laws.

The market opened at Rs. 471 for January 1944 in *Divali* days, and after advancing to Rs. 480 showed a sagging tendency. Prices touched Rs. 447 on the 1st November, but steadied to some extent after that, and rose to Rs. 466 on the 6th.

Unseasonal Rains

The possibility of a big Indian crop was upset owing to late unseasonal rains which badly affected quality and quantity everywhere. The arrival in Khandesh, Berar, and other districts showed black leaf, which does not go even in process. The sagging tendency continued thereafter, and prices touched Rs. 436 on the 18th. Business was done on a very small scale, and mills were not interested in futures. The ceiling rates for cloth and yarn were being prepared and prices were to be printed on every piece of cloth that came out of the mills from 1st December. Market remained featureless more or less for most part of November, but towards the close of the month there was a rise of Rs. 20.

The month of December showed signs of much activity in ready cotton, in consequence of which forward market, which had all along been in jobbers' hands, had to follow the advancing prices of spot cotton from day to day. The prices touched Rs. 477 towards the middle of the month, but thereafter there was a reaction of Rs. 17, January contract going down to Rs. 460 on the

20th. The Indian Crop Report estimates a crop of 46,82,000 bales. Finally prices closed on 31st as under:—

January Rs. 480, March Rs. 475-12, May Rs. 477-4.

New York 19.66 March, Parity 119 points below New York; Cross rate 4.03.

Cloths and Yarns

The year saw heavy fluctuations in prices. Prices were rising in all commodity markets, and cloths and yarns could remain no exception. As prices of commodities were not controlled at the start of the crisis, it gave an opportunity to investors to step in and corner various commodities. There was already a shortage of cloths and yarns on account of heavy Government purchases and heavy exports in 1942, and this " investment buying " led to a further apparent shortage of stocks; while no sales were reported by mills at very high prices, inter-dealer business raised prices to very high levels. Besides, there sprang up both in Bombay and several large cities purely speculative purchase and sale of cloths, no deliveries being contemplated, and this resulted in very wide fluctuations in prices. With apparently small stocks and continued normal trade demand, prices were bound to rise, and outside factors mentioned above tended to accentuate the tendency towards a rise in prices. In the opinion of some experts the financial policy of Government itself contributed in some measure to a rise in commodity prices. The Anti-Hoarding Orders and Cloth Control Orders were a first step towards reduction of cloth prices. The stocks disclosed showed that there was sufficient cloth in the country to meet all reasonable requirements. The time limit for disposal of stocks manufactured before 31st July, and fixing of ceiling prices for half a dozen cloths had not much effect on retail prices, except that in October it became almost impossible for dealers to sell goods not texmarked, thus defeating the very purpose of the Anti-Hoarding Order. Since ceiling prices were fixed for only a few items, it was possible to effect sales of a large variety of cloths at prices that were decided upon by manufacturers and dealers themselves; and since no price limit was fixed for retail sales, the consumer, for whose benefit price fixation was supposed to have been decided upon, did not get any benefit. The amendment of the Control Order making it compulsory for mills to obtain from the Textile Commissioner ex-mill ceiling prices for every variety of cloth, and to stamp this and the maximum retail price (fixed at 20 per cent. over the ex-mill price) will have the effect of reducing the prices of cloths to consumers.

Rise in Prices

The rapidity of the rise in prices may be judged when it is remembered that 20s yarn, sold in the beginning of the year at Re. 1-8. changed hands at as high as Rs. 3 in May. 20/20s grey cloth, offering at Rs. 2-1 a lb. in the beginning of the year. was sold at Rs. 3-14 a lb. in May. There was nothing to justify this rise except inflation of currency, consequent " investment buying " and consequent apprehended scarcity of cloths and yarns. Intermediate fluctuations were also high, a difference of 6 to 8 annas in a few days being not uncommon both in cloths and yarns.

In January, 20/20s was quoted at Rs. 2-1 per lb. in the beginning. Prices rose to Rs. 2-3, declined to Rs. 2-0-6 and rose again to Rs. 2-7 with inter-merchant business on a considerable scale. Consumer inquiry and offtake continued fair throughout the month. First orders for Standard Cloth were placed by Government for January delivery on the basis of Panel prices for Supply Department cloths. No large sales were reported by mills during this month, but during February, sales by mills were said to have been effected on the basis of Rs. 2-2-6 to Rs. 2-3 a lb. for calendered shirtings and Rs. 3-8 a lb. for 30s/40s *dhotis*. At one time during the month leopard cloth was bought and sold as high as Rs. 3-5 a lb. During March, mills are reported to have sold 20/20s shirtings at about Rs. 2-10 a lb. and 30/40s *dhotis* at prices ranging from Rs. 4-12 to Rs. 5. Inter-merchant transactions were effected as high as Rs. 3-3-6 for 20/20s. The Finance Member's threatening speech brought these prices down to Rs. 2-10-6 but soon recovered to Rs. 2-15 a lb. During April, markets fluctuated heavily both ways ranging between Rs. 2-12 and Rs. 3-7 a lb. for 20/20s cloths. During May, mills are reported to have sold *dhotis* in 30/40s at Rs. 5 a lb., and *saris* in the same quality at Rs. 5-8 a lb. There were heavy fluctuations in the prices of leopard cloths. Prices rose to Rs. 3-8 a lb., declined to Rs. 3-3 on rumours of control, rose again with intermediate fluctuations to Rs. 3-14 and were down again to Rs. 2-12. During June and July, there was hesitancy in demand, but prices remained fairly steady round about Rs. 2-10 a lb. for 20/20s. In August, ex-mill ceiling price for 20/20s was fixed at Rs. 2-2-9 per lb., but prices in the market fluctuated between Rs. 2-3 and Rs. 2-8 from August to November. In December, ex-mill and retail ceiling prices were fixed for all sorts delivered from mills from 1st December, but their effect on prices to consumers was not felt to any extent as stocks of unpriced goods were large. The period during which non-texmarked goods could be sold ended on 31st December 1943. There were considerable stocks of these goods at the end of the year, and these have been frozen.

Yarns saw heavy ups and downs as cloth. Prices for 20s, starting from Rs. 1-8 a lb. rose to over Rs. 3 in May with wide intermediate fluctuations. In December, ceiling prices were fixed for main counts of yarns, but the coarser counts sold considerably below ceiling prices.

Offtake of cloths and yarns continued good throughout the year except during July and August when there was hesitancy and marking of time. Stocks at the end of the year were the lowest since February 1941.

The year 1943 has been more prosperous for the industry than any that has gone before. Prospects for the year 1944 are not as rosy as the actualities of the year that has just expired, as cloth and yarn prices are to be fixed every quarter on a basis that, while leaving fair margins for the mills, will not allow any runaway markets.

Preparation of Wool for Market

By SHAMJI MAL, *In "Indian Farming"*

THIS is a brief note on the method of clipping, cleaning and marketing wool. These three subjects are apparently distinct from one another but are, in fact, closely allied and interconnected: they cannot be treated, with full justice, one dissociated from the other two.

The first in the series comes clipping, as collecting and marketing necessarily follow it. It is first necessary to point out that the clipping seasons vary in different provinces and not infrequently in different districts or sections of the same province. The wool-producing areas may be classified into three divisions with reference to the number of clips they have in a year. The northern districts of the North-West Frontier Province furnish an instance of an area where sheep are clipped only once a year, during April-May. In the Punjab, the usual practice is to shear the wool twice in a year, viz., during February-March and August-September. The wool clipped during February-March is white, while that clipped during August-September is yellow.

Clipping

This process is at present being conducted rather haphazardly and all the fleece is mixed up. The old-time method of shearing with the hand shears should give place to the shearing machine. Less skill is needed to operate the machine with the same efficiency as hand shears. There is little danger of cutting unless carelessly handled.

The position in which the sheep is held while the different parts of the body are being shorn can be best learnt by watching a skilled workman at work. The proper position for shearing is to place the sheep on its rump between the knees of the shearer. The sheep's legs should be left free and the head should always be held off the floor. In this position it might be tilted either to right or left and backward or forward as the shearer may desire.

Another important point is to shear when wool is dry. Excessive moisture is injurious to wool which, when damp, soon becomes mouldy. The fibres are weakened, water stains the fleece with a brown tinge which no scouring will remove. A fleece that is removed when damp is likely, later on, to contain a large percentage of discoloured wool. Musty wool is shunned by the buyers and it can be sold only at a sacrifice.

Arrangements should be made by the Government at the clipping seasons in various centres to give demonstrations of shearing. To begin with, the wool of the head, face, neck, legs britch and belly should be clipped separately and that of other parts separately. Later on, it might be arranged to clip separately the wool of the various parts and market it accordingly.

Grading

Before dealing with collecting and marketing, it is necessary that the subject of grading wool be discussed inasmuch as this preparation for marketing affects the price it ultimately fetches.

Classification of wools in the fleece is what is technically called grading. The work of grading should be performed by wool graders, preferably at a central wool warehouse before wool is sold. Grading is done without untying the fleece. Fleeces are placed on the grading table for the grader who allocates the fleece to its proper grade. Fleeces of various grades are warehoused separately and when a sufficient quantity has accumulated they are packed for marketing.

Preparation for Marketing

The wool must be properly prepared and carefully handled for marketing to bring its face value. The market value of wool can be seriously reduced at the time of shearing by lack of preparation for market. Money spent in improving the appearance and value of the wool by trimming and clipping fleece is amply repaid.

Remove heavy dung-locks, tags, etc., before shearing. If left in the fleece these strain the wool that comes in contact with them. Clip them from the animal and pack them separately.

Fleece that contains an excessive quantity of tags, heavy dung-locks (*leida*) or other foreign substance have a soggy feeling and their price is discounted by expert buyers.

Always roll the fleece with the flesh side out, as this side presents a much brighter and far more attractive appearance than does the weather side. This is a vital point and the grower should always keep it in mind. When rolling spread the fleece with the flesh side down, fold in from the sides and ends, then roll from tail to neck. This method will bring the shoulders and sides, or the best parts of the fleece on the outside.

Tie each fleece separately. Do not roll fleeces too tightly or they will appear less desirable than they are.

Straw, chaff, sticks, burrs and other extraneous matter should be prevented from mixing with the wool.

Method of Marketing

The present method of marketing is for the producer to sell the wool in the nearest primary markets, from where it finds its way to the main markets and there it is ultimately sold to the exporters or to the manufacturers.

The members of the nomadic tribes known as Ods or the zemindars who own sheep usually take money in advance from the dealers in the markets to whom they eventually sell the wool. The dealers in the primary markets are responsible for collecting from the shearing centres and in their turn they send it to the main or central markets.

Most of the wool produced in India is exported either for sale at the periodical Liverpool auctions or to buyers in the U.S.A.

The defects of the Liverpool sales have been frequently discussed. It would be a good saving to the Indian exporter and ultimately to the producer if markets are established at an Indian port, Karachi or Bombay, where wool might be sold to foreign buyers.

Cloth Distribution on Equitable Basis

New Plan Outlined at Textile Control Board's Quarterly Meeting

A NEW scheme for distributing cloth on an equitable basis was outlined by Mr. Krishnaraj M. D. Thackersey, Chairman of the Textile Control Board, presiding over its meeting held in Bombay on the 13th October 1944; the scheme will come into operation from the 1st November, 1944. He assured the Board that despite the various handicaps in respect of coal and textile auxiliaries, the production of cloth had been maintained at the optimum possible level, but stated that there was a limited supply of finer varieties of cloth. The meeting was attended by Sir Akbar Hydari, Secretary, Department of Industries and Civil Supplies, Mr. H. M. Patel, Joint Secretary, and Mr. M. K. Vellodi, Textile Commissioner.

The Chairman informed the Board that the ceiling prices of cloth and yarn had been further scaled down. The reduction worked in the case of cloth at the rate of one anna per rupee over the prices ruling in the quarter ended August, while in the case of yarn it varied from one anna to three annas per lb., according to counts. The schedule for the fixation of ceiling prices for all types of cloth had been revised on a more rational basis, removing the various anomalies which had become apparent by the working of the current schedule and the mills had been requested to re-work the ceiling prices for all their manufactures. Those prices, after necessary checking, would be re-notified and would become operative as quickly as possible.

In connection with the supply of finer goods, Mr. Krishnaraj stated that there was a limited supply of finer varieties of cloth, the output of which totalled less than 5 per cent. of the industry's production. The demand for finer qualities had, on the other hand, increased considerably during recent years owing to the complete change in the taste of the consumers. While steps were being taken to encourage mills to produce such types of cloth as were at present in larger demand, he wanted the Board to realize that any very large improvement in that direction was not possible owing to the limited capacity of the mills to do so and the use of a very great portion of the imported cotton for making cloth for the Defence Services.

Movement of Cloth

Continuing, the Chairman said: "Although the distribution of the production of the mills has been canalised and the movement of cloth from the manufacturing centres to consuming districts has been arranged on a more rational basis, actual experience has shown that certain parts of the country have not been receiving adequate supplies of cloth commensurate with their requirements. It is proposed to introduce a distribution scheme with the object of ensuring an equitable distribution of cloth to the various surplus and deficit zones as defined under the Cotton Cloth Movement Control Order* commensurate with the population of those zones.

"The scheme envisages the allotment of a predetermined quota from the available supply of cloth for the use of each Province and State in India, based on consumption in normal years, adjusted as may be necessary according to the total quantities now available. The number of wagons to be made available for transport of cloth from the main producing centres will be regulated in such a way as to restrict the maximum quantity which it will be possible for any one area to receive to that fixed under the scheme. With the assistance and collaboration of manufacturers and leading piecegoods merchants' associations in the main producing centres, it is proposed to ensure that each area will in fact receive upto the quantity allotted to it by the use of transport permits for the movement of cloth upto the maximum stipulated extent.

Transport Permits

"Movement by rail, road or sea will not be permitted except under these transport permits. Information will be given to a co-ordinated authority in the receiving zones of all despatches, the names of the consignors, consignees and other relevant details, so that the authorities in those receiving areas will be able to keep a check on the goods and see that the consignees do properly dispose of those goods. Once having ensured the despatch of a fair share of available supplies on a predetermined basis to each zone, I consider it is the duty and responsibility of the Control authorities in that zone to see that the cloth received is properly distributed throughout the zone, marketed at not more than the wholesale prices permitted and sold to consumers at not more than the maximum retail prices permitted under the Control Order. Every encouragement will be given to the authorities in each zone to devise and develop planned schemes for distribution to ensure that cloth despatched to each zone will reach the consumer at the proper price and eradicate black markets.

---

* See the *Indian Textile Journal*, November 1943, page 67.

" In developing any scheme of regional distribution it is of supreme importance for the Control authorities in the various zones to bear in mind the fact that trade should continue to remain substantially in the hands of those dealers who were engaged in it in the years 1940-42. All such 1940-42 merchants should be given a place and service to perform in the general scheme of distribution, such scheme being always arranged with the co-operation and assistance of representatives of the main piecegoods merchants' associations in the main piecegoods distributing markets.

Coal Supply Position

" The coal supply position continues to remain as before. Although there has not been any great stoppages of work due to shortage of coal during the three months under review, it should not be forgotten that this was made possible by Government switching over about 30,000 tons of coal which had been held by Bombay mills as stand-by against any contingency arising out of breakdown in supplies of fuel oil. This quantity was made available to mills and factories adjacent to Bombay, thereby affording some relief to the mills in other areas which have been able to receive coal upto the quantities allotted. The future is, however, still uncertain, but it is gratifying to see from a report recently published that the Government of India have for the time being decided not to permit any exports of coal from India. This, I hope, will go a long way in improving supplies within the country."

Sir Akbar Hydari, Secretary, Department of Industries and Civil Supplies, emphasized that the textile industry should place orders at an early date for machinery required for replacing the existing worn out equipment. He also urged the industry to increase the production of cloth, especially of finer varieties, in the interest of the civilian population in the country as well as of the industry, and hoped that progress would be made in that direction before the next meeting of the Board.

Yarn Distribution Plan

Two important announcements affecting the cotton textile industry in general and the handloom and power-loom industry in Surat in particular were made in Surat the other day by Sir Akbar Hydari, Secretary, Department of Industries and Civil Supplies, Government of India. The first was that a plan for distribution of yarn on an equitable and provincial basis had been evolved by the Department and it would be enforced within five or six weeks. The second concerned the establishment of a Handloom Textile Board to look after the interests of the handloom industry. This board would start functioning soon and the Surat handloom industry would be represented on it.

Sir Akbar Hydari was replying to an address presented to him by the Surat Weaving Association.

Replying to the demand for fixing a quota system for Provinces for the distribution of yarn, Sir Akbar announced that the demand was about to be implemented within five or six weeks, as they had been able to evolve a definite plan. Distribution would be on an equitable basis and not according to the desire or demand of the Provinces. That was in no way an empty promise. One could judge it on the results obtained. If no improvement was noticed in the distribution of yarn in Surat within a short time, then they were welcome to blame the Department.

Reason for Control

The Industries Secretary, however, pointed out that neither yarn nor cloth was in sufficient quantity in the country. If that were not the case, then there would have been no necessity for control. The

6407 8

main idea underlying control was to ensure equitable distribution of the available quantity. He thought that cotton textile control could be said to have been successful, the reason being the co-operation between the industry and the Indian public.

Mr. J. K. Thakore, the Provincial Textile Controller, would be in charge of the province-wide distribution of yarn. He made it clear that he would not be able to supply yarn to satisfy all requirements, but he could assure the gathering that the province of Bombay would get its equitable quota of yarn. He had been urged to increase the production of yarn, but it would certainly take some time.

Most of the work of the Textile Control Board was carried through private negotiation and discussion. As a result of that it was expected that there would be an increase in the quantity of yarn available for distribution.

Mr. J. K. Thakore announced that yarn meant for Surat which had been locked in Bombay for want of transport facilities would now reach Surat very shortly as the Government of Bombay had given special priority for the same. Owing to lack of transport facilities, some 75,000 bales of yarn and cloth had been accumulated in Bombay, and certain parts of India had not received goods for months.

Yarn Movement

The Textile Commissioner has decided that with immediate effect the Transport Section of the Textile Directorate will accept for movement registration applications relating to consignments proposed to be despatched by rail from Bombay City where the consignments comprise single yarn of counts 40s and below and folded yarn in cases where the constituent threads are of counts 24s and below. Movement in the case of finer qualities will only be allowed under a special permit. All applications for special permits should be made to the Provincial Textile Controller, Government of Bombay.

CONTROL NOTES AND NEWS

Cloth Distribution Hampered By Quota-holders

Fifteen months' enforcement of the various textile control measures introduced by the Government of India has not yet fully achieved the twofold objective of control, namely, to make available to the people of the country cloth in sufficient quantities and at reduced prices, and to increase the overall production of textile mills in the country. This is the view not only of the general public but also of those well informed about the textile industry and the cloth trade.

It is realized that on the Textile Control Board's recommendation, the Government have been able to curtail prices of cloth by about 40 to 50 per cent. from the 1943 peak. The vast mass of consumers, especially those in the deficit areas, are not, however, reaping the benefit of the reduced prices owing to defective distribution. The introduction of the quota system eliminated dealers who had entered the trade in the 1943 boom, but those holding quota permits are doing business just as they like.

Payment of Heavy Premiums

The majority of the quota holders are in Bombay and Ahmedabad and they seem to control the distribution to other provinces. Up-country dealers who come to the producing centres of Bombay and Ahmedabad find it impossible to get stocks from the quota holders. Only on payment of heavy premium can they get what they want. It is felt that unless this ring is broken cloth at controlled prices will not be available to the ultimate consumers.

It is also felt that steps should be taken to step up production in the mills. That there is room to expand production is proved by the fact that the mills now under Government control have been able to augment their monthly output considerably. An overall increase in production will not only help the authorities to eliminate malpractices in the trade but also provide a bigger *per capita* quota than 12 yards a year.

Railway Priority : Consumer Goods Movement

The following procedure for obtaining railway priority has been laid down and is published for general information, says a Press Note issued by the Controller-General of Civil Supplies :—

No scheduled article shall be moved from Bombay, Karachi, Calcutta or Madras without a certificate from the Controller-General of Civil Supplies, provided that no such certificate will be required when a copy of the release order from the Controller-General is produced before the Regional Controller of Railway Priorities by the dealer.

To obtain railway priority, application should be made by the consignor to the Regional Controller of Railway Priority at the despatching end and movement will be arranged by him. For instance, if goods are to be sent from Bombay to

Calcutta, the Regional Controller of Railway Priorities, Bombay, will give the necessary priority on receipt of the Controller-General's certificate referred to above.

For the movement of scheduled articles from places other than the four places mentioned above, the normal railway priority rules will apply. This new arrangement will take effect from 5th September 1944.

The scheduled articles governed by the Consumer Goods (Control of Distribution) Order, 1944, are : Wines, spirits and liquors, lead pencils, slate pencils, toilet requisites, boot and metal polishes, steel pens, fountain pens and parts of fountain pens, silk yarn and thread, artificial silk yarn and thread, pure and artificial silk fabrics, umbrellas and parts of umbrellas, enamelled ironware, kerosene oil lamps, incandescent mantles, zip-fasteners, razors and razor blades, cutlery, typewriters and parts of typewriters, typewriter ribbons, wireless receiving sets and parts of wireless receiving sets and wireless bulbs, cycles and cycle spare parts and accessories, photographic negatives and printing papers, clocks, timepieces and watches and parts thereof, cartridges, crockery, spectacle frames, sanitary fittings, sports goods, grindery and camphor.

Government Approved Cloth Shop in Poona

Poona Camp has now a Government approved cloth shop. The firm selected by Government is that of Messrs. Motichand and Premchand, Centre Street.

Mr. F. N. Rana, Additional District Magistrate, in declaring the shop open said that he had agreed to perform the ceremony chiefly because of the public service rendered by the firm at a time when profiteering in cloth was rampant in Poona. He announced a donation of Rs. 1,000 made towards the Disabled and Wounded Indian Soldiers' Fund by the proprietor of the firm, Mr. Jayantilal K. Kapadia, and said that the Collector had asked him to thank Mr. Kapadia for the gift. Mr. Kapadia said that as token of service to the public the shop would charge only 15 per cent. over the ex-mill price, although Government allowed a margin of 20 per cent.

New Textile Duty

It is notified that the customs duty under the Cotton Textiles Fund Ordinance is to be levied from 1st October.

Yarn Dealers' Returns

Under condition 2 of the yarn dealers' licence, licensees must submit to the Provincial Textile Controller, Kalachowki, Parel Road, Bombay, returns of yarn stocks by the 5th of each month in the prescribed form, a copy of which is supplied to every licensee when the licence is first issued. Besides showing stocks of yarn under each head mentioned in the form, the return should show the correct number of the licence and the month in respect of which the return is submitted. Even if no business has been transacted or the stock is *nil*, a return making a statement to that effect should be submitted. Irregular submission or non-submission of returns may involve a penalty amounting to the cancellation of the licence or non-renewal if it is due for renewal, says a Press Note from the Public Relation Officer, Rationing.

Hand Printers and Dyers

Under the Bombay Hand Printers' Licensing Order, 1944, read with the Government of Bombay, Finance Department (Supply), Notification No. 195/A of August 24, 1944, it was notified that no hand printer should print cloth and no dealer order the printing of cloth after 24th September 1944, in Bombay City, the Bombay Suburban District, the Ahmedabad Municipal Borough, the Cantonment of Ahmedabad and the revenue limits of certain villages in the City Mahal of Ahmedabad. Applications for the grant of licences under the order are being considered. Pending the passing of orders on applications received in the office of the Provincial Textile Controller, those applicants who have paid licence fees and who are already practising as printers and dyers may continue to do so, says a Press Note issued by the Provincial Textile Controller.

Control of Silk

Under the Consumer Goods (Control of Distribution) Order, all producers of pure and artificial silk fabrics, including chiffon, georgette, crepe, satin and ninon, have to furnish to the Controller-General of Civil Supplies, so as to reach him by the fifteenth day of each calendar month, detailed information of the description and quantity, actual or estimated, of these articles produced by them in the preceding calendar months, the actual or estimated cost of production and a statement as to how it is proposed to dispose of them, states the Controller General of Civil Supplies in a Press note. Those who fail to send these returns are liable to prosecution.

Hand Printers Order

On a point of interpretation of the Bombay Hand Printers Licensing Order, 1944, the Government of Bombay have replied to the Textile Processors' Association (India) as follows:—

"According to clause 1 (5) of the Hand Printers Licensing Order, 1944, printing includes 'roller printing' and such other printing as may be included by the Government. Roller printing is thus included within the scope of the Order which is intended to be made applicable to all kinds of printing other than that done by mills."

Bengal "Yarn Shortage"

The Secretary of the Calcutta Yarn Merchants' Association, Mr. H. K. Jhajharia, has issued a statement that Bengal is facing great scarcity of yarn at present, and that if immediate action is not taken by Government, famine conditions in yarn will arise. Since the quota scheme came into operation only 6,000 bales have been allotted to Bengal, compared with the normal 15,000 bales.

There is no justification for the complaints that have appeared in the Press about the exports of yarn from the mills in Madras to Bengal, states a Press Note issued by the Textile Commissioner. It says that during the five months ended August, 1944, despatches of yarn from Madras to Bengal by sea alone have averaged 8,678 bales each month. Furthermore, at the request of the Textile Commissioner to the Government of India, arrangements were made for the despatch of 2,000 bales to Bengal during September in addition to the normal exports.

Commercial and Technical Organizations

Africa and Overseas Merchants' Chamber, Bombay

Memorandum to Commerce Member.— The following are extracts from the memorandum presented by the Chamber last month to the Commerce Member to the Government of India:—

Textile Export Control

"The Export Control Scheme recently introduced allows 20 per cent. maximum margin f.o.b. over the Indian ceiling prices. This 20 per cent. consists of 7 per cent. for the mills, 3 per cent. by way of export cess and 10 per cent. f.o.b. for the exporters including all shipping and storing charges. My chamber in the memorandum that was submitted to the Hon'ble Mr. Pillai, the Commerce Secretary, during his visit here during June last desired that 15 per cent. f.o.b. would be a reasonable margin to the exporter ; in fact the members of my chamber have had to face within a short period of the operation of the scheme, a serious situation which has been jeopardizing their business to a very great extent, because in the first instance the millowners generally insist on sales through their dealers who retain 4 per cent. margin for themselves thus leaving only 6 per cent. f.o.b. for the exporters. Deducting the acknowledged expenses of 3 per cent. from this in the shape of storing, shipping and other incidental charges, there remain a bare nominal margin of 3 per cent. only for the exporter. You can realize, sir, in what a hopeless position the exporter is thus placed in these abnormal days with such a pittance when he has to undergo so many risks in the various stages of shipments and when there is a very meagre turnover. I hope you will kindly give this matter your very serious consideration and decide a reasonable margin of, say, 10 per cent. net at least for the exporters (in place of 6 per cent. with expenses which is left for the shipper as shown above at present). Besides, most of the mills in Bombay and Ahmedabad as well as in other up-country centres are reluctant to enter into direct transactions with the exporters and the result is that the orders received by the exporters from overseas markets are not adequately met. This adversely affects the export trade of India. We may also mention that we are sorry to observe that most of the mills were only too anxious to sell to the exporters at their prices just prior to the 8th of July on which date the Export Price Control Order came into force ; but immediately after the promulgation of the said order, the mills argue that there is an acute shortage of textiles in the country and consequently it is impossible for them to deal with the exporter. As long as they were in a position to dictate their prices and terms to the exporters it is a well-known fact that they made it a point to avail themselves of the overseas orders and never mentioned the internal requirements nor expressed their sudden patriotic care for the same. We understand that the Export Trade Controller has already brought to the notice of your department the seriousness of the situation resulting from the attitude of the mills. We should not like to dilate too much on this unhappy affair. However, we do appeal to you to so adjust the so-called quota system introduced by the mills that the exporters might make purchases from the mills not as a matter of indulgence but as a matter of national exigency. Otherwise, the overseas markets will be diverted to other channels and the country as a whole will be the loser.

Export Committee

"The Commerce Department having recognized this chamber as a representative body of the export trade, I, as its chairman, have been invited to serve on the Export Advisory Committee of the Export Trade Controller as well as the Export Committee of the Textile Control Board ; and I may be permitted to submit that my experience on the latter committee is not very happy as that committee predominantly consists of manufacturing and other interests who seldom appreciate the importance of export trade. I have invariably pleaded that the present level of our exports should be maintained if not increased and to that end special efforts should be made to consolidate the present markets that have come as a godsend within our sphere. I do, therefore, hope you will kindly consider this my submission as well in the interest of the exports from India.

Goodwill Delegation

"As stated above, the future of our export trade with Africa and other overseas countries, on account of racial and political hostility, is not very bright. It will be in the fitness of things if you decide to send a goodwill trade delegation consisting of both officials and unofficials in the near future in order to secure firsthand knowledge of the requirements of the countries who are likely to remain our customers after the cessation of hostilities. My chamber is prepared to be helpful in such a scheme, as it would be in the interest of not only the exporters but the Indian industry as a whole in the post-war period when Indian markets will be flooded with foreign imports. There was a time when political delegations had their uses but the world is fast changing and it is economics that hold the field. Therefore you will agree with us if we emphasize the importance of trade missions in the ensuing post-war period. The European war is drawing to a close and it is well-nigh certain that the conservative elements all the world over will want to revert to the pre-war position not only in politics but positively in economics. The trade outlets for India created by the present war are more or less a providential affair. If we make no efforts to preserve them, there is the likelihood of this good luck passing away from our hands. The markets of the Middle East as well as Africa which are at present in our economic orbit, will be a valuable asset after the war for our trade and industry. In future, India will not be able to support her teeming millions on agriculture alone. Our national industries must require kindred markets. Just as human life can only be sustained by two lungs, similarly, agriculture and industry ought to constitute the two lungs of our economic life. But India has so far made no major endeavours to foster trade relations with her neighbours. This is the most opportune and auspicious time to chalk out a programme for sending out a trade delegation to Africa and the Middle East."

Andhra Chamber of Commerce, Madras

Annual Meeting.—The following are extracts from the speech of Mr. Narayandas Girdhardas, President of the Chamber, delivered at its eleventh annual meeting last month :

" The excess profits tax and increase of income-tax and corporation tax have deprived industries not only of cent per cent of any extra profits that they might make as a result of the war but in some cases have even curtailed the standard profits which they were making before the war broke out. The policy of taxation of the Government of India is such as to enfeeble and crush the existing industries in the country, particularly those which are struggling to establish themselves. The burden on Indian industries bears no comparison with the burden placed on British industries. The conditions of the two are quite different. British industries have accumulated assets out of the huge profits in the past, whereas Indian industries have not been able to do so. British industries have built up their reserves and developed their financial strength. Indian industries have not only been unable to build up such reserves but several of them have been passing through the ordeal of just securing their financial equilibrium. It is, therefore, clear that the earning capacity and staying power of British industries are far greater than those of Indian industries.

" Therefore, British industries can bear the burden of taxation with ease while such burden of taxation will only serve to crush several industries in the country. It should be remembered, therefore, that the demand for the revision of the present policy of taxation is justifiable and it is only an expression of nothing but common sense born of anxiety to ensure India's industrial future. The British Government are keen on helping British industries, whereas their inaction and indifference where India is concerned are in striking contrast with their sympathetic attitude towards the future of British industry. The problem of modernization and re-equipment of Indian industries and their future expansion on sound financial lines has been, therefore, causing us all serious anxiety. The Chancellor of Exchequer told the British industrialists that they were entitled to know where they stand and there was, in my judgment, a very definite contribution which the taxation policy can and should make to the problems of reconstruction. He also assured them that they would take suitable measures to give industrial enterprise a fair chance to meet the challenge which the future holds for all. He also announced a special initial allowance of 20 per cent. of the cost of new plant and machinery in addition to the post-war credit of 20 per cent. of the amount of the taxation paid. Therefore, it is a fair and just demand of the Indian industrialists to the Government of India to let them know where they would stand in future and what definite assistance they could expect from the Government for the re-equipment of future development and expansion. Apart from the taxation policy, there is another factor which will seriously affect the Indian industries and weaken them. It is the import policy of the Government of India which will weaken the capacity of the industries to meet even their immediate post-war requirements.

" It is stated that not a single commodity is being imported which would seriously affect any existing Indian industry and the Government have assured the public that care was being taken to see that commodities imported were such as were not produced in this country or were produced in very small quantities. If these principles are strictly adhered to in the import of civilian goods no one has any cause for complaint. The Government refuse to give us statistics of the commodities imported and we are told that information could not be given in the interests of the public. It is common knowledge that 11.7 million yards of cloth were imported from the U.K. while cloth is actually being exported cut of India in large quantities.

" Heavy chemicals like sodium sulphate and zinc chloride have been imported as a commodity of civilian consumption while these chemicals are or could be manufactured in this country in sufficient quantities to meet the requirements of this country.

" Industries such as bobbins and shuttles have been established during the war ; without these the textile mills and jute mills would have found it extremely difficult to keep themselves continuously working. Such industries should be allowed to develop and expand by providing them with facilities for the import of machinery and spare parts or raw materials which they badly need.

Indian Chamber of Commerce, Calcutta

Quarterly Meeting.—The following are extracts from the presidential speech of Mr. B. M. Birla at the second quarterly meeting of the Chamber :—

" It is the industrial production of the United States which has changed the fortunes of war. The future safety of the Asiatic countries is dependent on the industrialization of India and China. Let those who talk disparagingly of industrialization remember that in the modern world, power goes with industrial strength." These observations were made by Mr. B. M. Birla in a comprehensive survey of India's economic and political conditions in his presidential address at the second quarterly general meeting of the Indian Chamber of Commerce, Calcutta, held on Friday, the 22nd September, 1944."

The Bombay Plan had made the Government realize it could no longer sit still and had resulted in the creation of the new Department of Planning and Development under Sir Ardeshir Dalal, an ex-President of the Indian Chamber of Commerce. Mr. Birla drew pointed attention to the fact that though a number of post-war plans had been issued recently none of them, curiously enough, dealt with industrial development. The fact was that industrialization had never ranked high in Government's list of priorities. Mr. Birla added : "Let us hope that with Sir Ardeshir Dalal as Development Member, the subject will have its due place in the official scheme of things and a vigorous policy making up for apathy and neglect in the past will be pursued. We wish him every success in the task on which he has just entered." Mr. Birla next dealt with the country's industrialization, how it has been achieved in face of difficulties and what would have been the country's fate during war had industries not been developed by Indian enterprise.

He said out of 6,000 million yards of cloth production Government took away 1,500 million yards for military requirements and exports. This reduced cloth consumption in India from 16 yards to 11 *per capita.* A country already underclothed had thus to go nearly 30 per cent. short of cloth. It was something to be thankful for that indigenous production had kept the masses clothed at least to a limited extent. And it was the result of the textile industry's effort that prices had come down by nearly 50 per cent. compared to the peak figure during the past twelve months.

Mr. Birla pointed out that whereas other countries had increased their productive capacity during the war India's industrial production had increased by hardly 10 per cent. In China and the countries of the Middle East prices had risen 50 to 100 times ; even in the U.S.A. and U.K. prices had gone up because of the scarcity of man-power and the higher purchasing capacity of the people. Emphasizing the service rendered to the country by industrialists, Mr. Birla said : "If we take these things into consideration we should be able to see the rise in prices here in its true perspective and to realize that if we had less of industrialization, the rise would have been much higher and the consumer's lot much harder than it had been."

The most urgent problem, said Mr. Birla, was to maintain employment at a high level and that would in turn cause industrialization. He wanted the State to take the initiative and not wait on events to force their hands. Expenditure on public works might not give immediate dividend but would prove a good investment in the long run. Mr. Birla was emphatic in his view that the State should have a policy positively helpful to industries. There could be no justification, he said, for any import of goods unless it helped to produce more goods or was found really essential.

Wool in Europe

ALTHOUGH Europe is a more important producer of wool than of cotton, the wool supply position of the European mainland has grown progressively worse since the summer of 1941, when Germany started her Eastern campaign. Last year civilian supplies of warm wool clothing declined to a negligible level in virtually all continental countries, says the *Manchester Guardian.* Wool in civilian clothing, indeed, has become an admixture rather than a chief constituent. Figures published last month in the Swiss *Neue Zurich Zeitung* indicate that the present sheep population of German-controlled and neutral Europe amounts to about 100,000,000 of which 6,000,000 are accounted for by Germany, 19,400,000 by France, 12,000,000 by Rumania, 26,000,000 by Spain, 9,500,000 by Italy, 11,000,000-12,000,000 by Bulgaria. As compared with the data published by the Imperial Economic Committee in 1939, there appears to be an appreciable increase in the total European figure, although the changes have varied irregularly from country to country.

The expansion—which has been supported by premium payments to sheep-farmers in Germany and the Balkans—appears to have lagged behind the German plans which aimed at an immediate increase in the European sheep population to 130,000,000. Wool production in Europe, which, according to region varies between 1 and 3.5 kilos per sheep, much of it of poor grade, at present covers less than one-third of total European requirements, estimated by the Swiss paper at 600,000 tons per annum. As, moreover, the reserve of warm clothing of civilians everywhere in Europe has fallen far below normal, there is every likelihood that Europe's import requirements of raw wool after this war will be heavy and will thus help to solve the difficult problems set by the heavy accumulations of wool stocks in the producing areas and especially in Australia and New Zealand.

OUR PERSONAL COLUMN

Mr. S. C. Mitter, Director of Industries, Bengal, has been appointed Deputy Director-General of Production and Controller of Supplies (Bengal Circle), Government of India.

Mr. S. K. Basu, of the Dhakeshwari Mills, Ltd., Dacca, has been nominated by the Central Government to be a member of the Indian Central Cotton Committee, Bombay, to represent Bengal.

On his return from leave ex-India **Mr. G. B. Constantine**, I.C.S., has been appointed Commissioner of Labour and Registrar of Trade Unions, Bombay, with effect from 6th September, *vice* Mr. Joshi, reverting.

Mr. K. R. Damle, I.C.S., District and Sessions Judge, Moradabad, has been selected as Secretary to Sir Raghunath Paranjpye, High Commissioner-designate for India in Australia.

Mr. Ram Chandra, I.C.S., Chief Controller of Imports, will officiate as the Secretary of the Commerce Department *vice* Mr. N. R. Pillai, who goes to England and America for informal trade talks.

Mr. Pillai, who was in Bombay with Sir Azizul Haque, Commerce Member, to discuss the U. K. C. C.'s activities with commercial interests, took three weeks' leave before proceeding to London.

Mr. M. S. Bhatia of the Central Engineering Service, New Delhi, has been appointed Executive Engineer, Bombay Central Public Works Division, Bombay, in place of Mr. E. M. B. Ghosh, who has been transferred to the U. P. Central Division.

Rao Bahadur N. R. Samiappa Mudaliar has been appointed as a member of the Madras Provincial Advisory Committee for Standard Cloth to represent consumers' interests *vice* Mr. T. A. Ramalingam Chettiar, resigned.

Indian Scientific Mission.—A Scientific Mission consisting of seven well-known Indian scientists left for Britain recently to establish contact with British, Dominion and American scientists. The mission will also visit the United States of America.

A Press Note says : "As announced some time ago, following on the visit to India last cold weather of Prof. A. V. Hill, Secretary, Royal Society of London, invitations to visit the United Kingdom as guests of His Majesty's Government were extended to certain well-known Indian scientists. The following are the scientists who have been able to accept the invitation :—Dr. Nazir Ahmad, Director, Technological Laboratory, Matunga, Bombay ; Col. S. L. Bhatia, Deputy Director General, Indian Medical Service ; Sir Shanti Swarup Bhatnagar, Director, Scientific and Industrial Research Directorate ; Sir Jnan Chandra Ghosh, Director, Indian Institute of Science, Bangalore and President of the National Institute of Sciences of India ; Prof. S. K. Mitra, University College of Science, Calcutta ; Prof. Meghnad Saha, University College of Science, Calcutta ; and Prof. J. N. Mukherji, Professor of Chemistry, University College of Science and Technology, Calcutta.

Members of the staff of the Technological Laboratory, Matunga, gave a tea party to Dr. Nazir Ahmad, O.B.E., Director, on the eve of his departure to the United Kingdom and America as a member of the Indian Scientific Mission. Sir Chunilal B. Mehta, Vice-President of the Indian Central Cotton Committee, and Mr. D. N. Mahta, Secretary, Indian Central Cotton Committee had responded to the invitation of the staff.

Speeches were made congratulating Dr. Nazir Ahmad on having been selected as a member of the Indian Scientific Mission and wishing him *bon voyage*. Dr. Nazir Ahmad gave a suitable reply.

Mr. M. N. Lothe, formerly Carding and Spinning Master of the Osmanshahi Mill Ltd., Nanded, Deccan; the J. K. Cotton Manufacturers Ltd., Cawnpore, U.P.; the Rajratna Narayanbhai Mills Ltd., Petlad, and recently of the D. B. Ramgopal Mills Ltd., Hyderabad (Deccan) has now joined the Ananta Mills Ltd., Ahmedabad, as a Carding and Spinning Master in charge. He will also work as a consultant to the Shree Amarsinhaji Mills Ltd., Wankaner, which is under the same management.

Obituary

Mr. B. L. Waters

The death occurred on 23rd September 1944 in Walker Hospital, Simla, of Mr. B. L. Waters, Labour Adviser to the Government of India, due to abscess in the lungs. His age was 47.

Mr. Waters, who belonged to the British Ministry of Labour and National Services, had gone to Simla from New Delhi to draw up schemes for the development of labour exchanges in India.

Mr. Bhagubhai Mafatlal

Mr. Bhagubhai Mafatlal, 35-year-old son of the late Mr. Mafatlal Gagalbhai, millonaire and business magnate, died on 30th September 1944 as a result of an accidental fall from the terrace of his building at Altamont Road, Bombay. He was one of the partners of Mafatlal Gagalbhai and Sons, Bombay, who own several cotton textile mills and factories in the province.

According to Dr. A. V. Baliga, Mr. Bhagubhai, who was his patient, was in a depressed state of mind since the death of his father, two months ago.

There was no question of unhappiness in the family, and Mr. Bhagubhai being a multi-millionaire, there could be no financial anxiety.

Tata Institute of Social Sciences, Bombay

IT is significant of the increasing importance which labour welfare is being given by research workers that it is the subject of several of the theses submitted by graduates of the Tata Institute of Social Sciences, Bombay. At the latest convocation of the Institute, the Diploma in Social Service Administration was presented to the following candidates; the theses submitted by them are also noted against their names. Mr. S. P. Joshi—" A Socio-Economic Survey of 100 Shop Assistants in the Wholesale Cloth Trade of Bombay"; Mr. P. R. Khandekar—" A Study of the Welfare Work for the Textile Workers in Empress Mills, Nagpur," and Miss Lakshmi Rangaier—" A Socio-Economic Survey of 150 Working Class Families of the Bangalore Woollen, Cotton, Silk Mills, Ltd."

Candidate for Certificate.—Miss Sophia S. Corley—" Life and Labour of Textile Women Workers in the Sassoon Mills, Bombay."

With a view to meeting the demand that is sure to be made on the Tata Institute for competent social workers in post-war years, especially in the labour field, and also expanding its curriculum, some additions were recently made to the faculty. Dr. Moorthy, one of the junior members, is specializing in labour problems so that in the near future studies in labour problems could be offered as a separate course. Labour welfare is one of the important labour problems. Though several industrial concerns are doing something in the way of promoting labour welfare in the different parts of India, and though there is an increasing interest in welfare work, no systematic study has yet been made of labour welfare on an all-India basis. In the interest of labour in general and of the Institute in particular, it was decided to undertake the organization of available data on labour welfare on an all-India scale. This, it is hoped, would serve the double purpose of supplying its own students a comprehensive knowledge of fact and techniques of welfare work carried on in different parts of our country and in different industries, and of the distinctive aspects which have developed to meet regional requirements. Secondly, it would enable it to embody the findings of this research in an authoritative book on labour welfare which, it is hoped, would be an outstanding contribution to our knowledge of labour problems. Such a work would also be of great help to all those who are engaged in post-war planning for labour.

To this end Dr. Moorthy has been sent out on an investigation tour. His tour will cover the following industrial centres:—Jamshedpur, Calcutta, Delhi, Cawnpore, Ahmedabad, Sholapur, Bangalore, Madras, Coimbatore, Cochin, Madura and Bombay. In all these places he will contact labour welfare organizers, collect firsthand information about labour welfare work and also acquaint himself with the technique of welfare work adopted in these centres.

TRADE LETTERS

(From Our Special Correspondents)

Ahmedabad

THE working of the quota system enforced by Government is being attended with difficulties. The mills, which get fixed prices, are said to be inclined to lower the quality of their products so as to earn more profit, and they force the quota-holders to accept them. The latter on their part force on the retailers and up-country merchants what they get from the mills. The Maskati and Panchkuva Markets Associations—the two wholesale organizations in Ahmedabad—have prepared, with the approval of the Textile Commissioner, a quota system on the lines of the Government quota system. Both the systems are causing difficulties which are being brought to the notice of Government for solution.

Government is revising the rates of different varieties so as to leave greater margin for those varieties which are in great demand. Mills are turning from the manufacture of finer varieties to coarser varieties as the uniform reduction of rates of all varieties has led to greater reduction in the high-priced finer varieties. Government will have now to raise the rates of finer varieties to stop the curtailment of their manufacture, as their demand all over the country cannot be met and black market trading seems to be rampant. Government should also consider the question of still further encouraging the use of Indian cotton which has suffered most during the present war and they will have to raise the rates of coarser goods manufactured out of Indian cotton.

The policy of reducing prices of cloth has reached the utmost limit beyond which it appears it cannot go without disturbing seriously the production of cloth. Government has all along been zealous in preserving the existing trade channels in its campaign against black markets. Similarly, it should equally zealously protect the existing industries. It has from the beginning enlisted the support of the textile industry in the enforcement of the Cotton Cloth and Yarn Control Order. Pursuant to this wise policy it should allow the present prices to stabilize for some time before embarking on further cuts in prices. The costs of production have not declined proportionately to the cuts in the prices of cloth, and the margin of profits of the mills is declining. They have already started manufacturing those varieties which are more remunerative irrespective of whether they are wanted by the people or not and seem to be dumping on the trade unwanted goods.

Soon there may be a clash between traders and manufacturers of cloth. Traders will refuse to accept unwanted goods and consumers will have to purchase from the black market goods which they want. The object of Government to check black marketing in cloth will be frustrated. There is demand for Indian cloth from foreign countries also. The war with Germany is being prolonged unexpectedly, and the war with Japan is still to be waged in all its grim reality. Government has been trying to control the war economy in all aspects. It has met with a fair amount of success so far. It has saved the people from starvation and nudity while preserving the existing trade channels and protecting the interests of industries. The policy of co-ordinating various conflicting interests should be pursued in such a way as to enable the country to face the ensuing peace economy boldly. Inflation has been checked, but it should not precipitate depression. Regulation has profited both trade and industry during the war. Let it profit them equally when peace comes.

Some of our industrialists are preparing for peace economy from now. They want to eliminate the middlemen altogether throughout the country by spreading the net of their own selling organization. They will open their own shops to reach the consumers direct, and compete freely with foreign goods when they are dumped after the war. The cost of distribution will be minimized to raise the efficiency of production to the highest pitch. Competition will be keenest after the war, and those mills which will be able to stand it will reach the consumer at minimum cost. Some industrialists are thinking of opening new mills on the latest designs in those centres where the cost of production is the lowest. Such a centre is Kalol—about fifteen miles from Ahmedabad. It is in Baroda State, which charges no excess profits tax or other taxes on industries. Other industries are also springing up in the Baroda State because of numerous other facilities and concessions. The flow of industries from British territory to Indian States, which started before the war, will be accelerated after the war unless the British Government gives up its stepmotherly attitude towards industries. The post-war industrial policy of the British Government will have to be more positive and protective. What the Indian States do is quite welcome, but the British Government should not lag behind Indian States who are stealing a march ahead. Indian capital, which was shy and afraid of Indian States, is increasingly seeking their protection.

Indian industrialists in their search for new ways of competing with foreign goods after the war have forgotten to retain in the country crores of rupees which they will spend after the war in replacing their old worn-out machinery by new plant. The Indian steel industry has progressed sufficiently to prepare at least some of the machinery that we need for our varied industries.

South India

THE Government Silk Weaving Factory was engaged during 1943-44 mainly in the manufacture of parachute components and a portion of the production consisted of fabrics to meet civilian requirements. About 54,000 yards of parachute silk and 17,000 yards of fabrics for civilian use were manufactured during the year, in addition to large quantities of silk thread and cord required for parachutes. The factory is expected to make a net profit of Rs. 50,000.

Sri Krishnarajendra Mills, Ltd.

The position of the Sri Krishnarajendra Mills, Mysore, has improved appreciably of recent years. It has been able to liquidate its loans and to build up reserves to the extent of Rs. 17.25 lakhs. Owing to a prolonged strike and latterly to dislocation in the supply of electric power, the production of the mills last year was only 60 per cent. of the normal output.

Cottage Industries

The development of selected cottage industries like hand-spinning and weaving, paper-making, tanning, leather-stitching, mat-weaving, pottery, button-making, smithy and brass works, engaged the attention of the Mysore Department of Industries and Commerce during the year.

Hand-spinning and weaving was carried on at Badanval, Turuvanur, Hosur, Molakalmuru and Honnali, the value of *khadi* produced at these centres being Rs. 72,600. The amount of yarn produced was 35,835 lbs. The total sales at all these centres and at the " Bhandars " at Bangalore, Mysore and Arsikere amounted to Rs. 1,31,000.

A scheme for expanding the work of the wool spinning centre at Kolar is under consideration. The scheme contemplates the training of artisans in the production of high class woollen goods and the starting of small factories.

Handloom Weaving

There were 30 yarn depots and 9 relief centres in Mysore State during the year and the question of starting 30 more yarn depots and converting all the existing yarn depots into relief centres is under consideration. The value of yarn sold to weavers at these depots was Rs. 2,76,858, as against Rs. 1,18,865 in the previous year; and finished goods of the value of Rs. 1,97,311 produced at the relief centres were sold, as against Rs. 1,10,950 in the previous year. The dye house attached to the Sri Krishnarajendra Silver Jubilee Technological Institute helped in dyeing the yarn sold at the yarn depots. In connection with the demonstrations organized with a view to increasing the output and improving the quality of handloom fabrics, 724 workmen were trained in new methods of weaving, 915 new designs were introduced, 276 looms were fitted up and repaired. Handloom goods were exempted from payment of octroi and the value of handloom goods so exempted during the year was nearly Rs. 12¼ lakhs.

War Supplies

The total value of war orders undertaken by the several industrial concerns in Mysore amounts to Rs. 11.12 crores.

Sericulture

The acreage under mulberry in Mysore State was about 75,000 at the end of June 1944. In order to prevent further unrestricted expansion of mulberry cultivation, orders have been passed prohibiting the planting of mulberry on new lands except with the permission of the Deputy Commissioners.

Twenty-five crores of Mysore seed cocoons were produced during the year, as against 20 crores in the previous year. The Government and aided granages together supplied 218 lakhs of disease-free layings. Sixteen new aided granages have been sanctioned and when they start working, the total number of aided granages will be 89. The starting of a fully equipped sericultural farm and granage at Dodballapur has been sanctioned.

Under the scheme of filature expansion undertaken last year, 899 basins out of the contemplated total of 1,460 have been erected and 734 basins are working, besides 247 old basins belonging to the Mysore Silk Filatures, Ltd., and the Mysore Spun Silk Mills, Ltd. The quantity of filature silk supplied to the Government of India for war purposes up to the middle of July 1944 was 61,250 lbs.

Some of the machinery required for the Silk Conditioning and Testing House, which is being built at Channapatna, has been received.

The cocoon markets dealt with 69 lakhs lbs. of cocoons during the year, of which 20 lakhs were purchased by filatures and 49 lakhs by *charka* reelers. In order to give greater facilities to rearers, 10 more cocoon markets have been sanctioned, bringing the total number of markets to 51.

Jog Scheme

The total outlay on the civil engineering works of the Jog Scheme during the year was Rs. 44.78 lakhs, the total expenditure incurred so far being Rs. 108.07 lakhs

Satisfactory progress is being made with the manufacture of the hydro-electrical machinery required for the scheme and some of the items have already been shipped. All the equipment for Jog and the main transformers and switch-gear for Bhadravati are expected to be received by the end of December next. Almost all the steel plates required for the manufacture of pen-stock pipes have been received and the manufacture of pipes is in progress.

The total expenditure incurred on the electrical works of the Jog Power Scheme up to the end of June 1944 was Rs. 13,94,361.

Cawnpore

Patents and Trade Marks

A COMPREHENSIVE scheme aiming at extending the protection of industrial property, namely, patents, designs and trade marks throughout India, has been devised and submitted for the consideration of the Government of India by the United Provinces Chamber of Commerce in a representation addressed to the Secretary, Commerce Department, Government of India. Pointing out the inadequacy of the present legislation in protecting industrial property in Indian States, the Chamber claims that its scheme if implemented will remove these disadvantages without disturbing the constitutional position of British India and the Native States. Explaining the scheme, the Chamber suggests setting up a central liaison office under the direct supervision and guidance of the Chamber of Princes, which will function as an apex organization co-ordinating the activities of each individual State in regard to protection of industrial property and negotiating with the central registry in British India. The liaison office will scrutinize applications for trade marks in States and forward all such applications to the central registry in British India. In the opinion of the Chamber, the Federal Court alone will be the appellate Court to decide the cases of infringement. The Chamber also suggests that the Government of India should negotiate with the Chamber of Princes as a representative body of Indian States and arrive at a collective agreement in order to implement the scheme, which is expected to help the growth of economic federation of India and development of industries by affording the necessary protection to the subjects of States for their industrial rights.

Hoarding and Profiteering Prevention

The first meeting of the Provincial Advisory Committee for Hoarding and Profiteering (Prevention) Ordinance was held under the presidentship of Sir William Ibbotson, Adviser to the Governor (Supply), when several important matters were considered. Sir William said that the Provincial Government was anxious to obtain the advice and co-operation of traders and consumers in tackling the problems created by the war situation and scarcity of commodities. There was evidence to show, he continued, that after the promulgation of the Profiteering Ordinance prices had ceased to rise and there was a tendency for prices to fall. The Committee discussed at great length whether the policy of fixing immunity price should be abandoned or not. It was ultimately agreed that the fixation of these prices was still of considerable value provided they were reviewed periodically. The trade representatives explained at length their difficulties in getting supplies and pleaded that high charges for transport, packing, etc., left them a negligible margin of profit. They complained that the Trades Associations of the Province, particularly the retailers, had not been consulted when prices were fixed by the Central Government. It was generally agreed that the question of supply was the crux of the problem and the Provincial Government's greatest concern should be to see that stocks came into the Province. The new Consumers' Goods Order has created machinery which could be used in getting stocks to up-country dealers, but as at present drafted the Order centralized all powers in the hands of the Controller General rather than in the hands of the Provincial Governments. It was strongly urged that as far as the selection of approved retail dealers under this new Order was concerned, the Provincial Government in consultation with trade associations of the Province would be the proper authority to make this selection.

Allotment of Quota to Cloth Dealers

According to a Press Note issued by the U.P. Government, it is announced that the Textile Commissioner (in consultation with the Provincial authorities) is considering the question of allotment of quota to those dealers who are entitled to quota but have been deprived of the same owing to the cancellation of the licences of those Bombay wholesalers through whom they used to deal with the mills in the basic years. All the dealers who had dealings with such Bombay wholesalers were asked to furnish the Textile Commissioner before 30th September 1944 with full particulars of the purchases made in the years 1940-41-42, through their respective District Magistrates under intimation to the Provincial Government. The names of the dealers through whom the purchases were made in the basic years together with the names of the mills of which the goods were the products should also be stated.

According to another notification, all licences of hawkers and hawker-retailers registered on or after 1st January 1944 have been cancelled with effect from 1st October 1944. Those who had registered before 1st January 1944 should surrender their present licences on or before this date when new licences on revised forms will be issued. It is further announced that " no hawker or retailer-hawker will be allowed to sell or purchase cloth or yarn on or after the 1st October 1944 unless he is in possession of the revised licence."

The total number of cases disposed of in August last under the Cotton Cloth and Yarn Control and Allied Orders in 43 districts of the United Provinces was 102; of these, 80 cases ended in conviction and 22 in acquittal. The percentage of acquittal was higher in August as compared to that in July. The highest sentence was awarded in the District of Unao where one Nand Kishore was sentenced to 8 months' rigorous imprisonment with a fine of Rs. 1,000 for selling cloth without a licence. The other substantive sentences of imprisonment were of six months' rigorous imprisonment passed in two cases in the district of Hamirpur and Fatehpur for selling cloth without a licence. Heavy sentences were also passed in the districts of Bahraich, Sultanpur, Muttra, Pratabgarh and Meerut, where substantive sentences of imprisonment were awarded along with fine.

Ten-Year Industries Plan

An ambitious plan costing about Rs. 7,50,80,000 has been prepared by Mr. L. C. Jain, I.C.S., Director of Industries and Commerce, U.P., for the post-war development of his department in 10 years. The plan is a very comprehensive one in outlook, taking as it does a broad view of the needs of existing industries in the Province and providing for the starting of several new large-scale, medium-sized and small-scale industries as well as cottage industries.

The scheme also emphasizes the need of remodelling education, especially technical education. It recommends the starting of several polytechnics in which a number of trades should be taught in the same institution. As all technical training has much in common, it is observed that a polytechnical institution is the one best fitted for the task of co-ordinated progress. The Government, it also emphasizes, should bring about contacts between industrialists and technical men, providing facilities by which the industrialists, especially small-scale producers, might easily recruit their technicians. The Government also should provide expert technical advice and new designs for the use of industry. The formation of a Central Marketing Organization as a public limited company with a capital of Rs. 10 lakhs, out of which one-fifth might be contributed by the Government and the balance by the public, is also recommended.

It stresses the need of paying special attention to developing such basic industries as heavy chemicals, re-rolling, and engineering, cement and fertilizer production, etc., some of which have already been started in a small way. At present the Province is deficient in the supply of these articles, which are needed for the cotton textile, leather, glass and paper industries and their expansion would fill a lacuna in the industrial development of the Province. The necessity of making an elaborate scientific survey of raw materials, development of transport and increased mobility of labour for industries is also stressed. And since the development of industries depends essentially upon the tariff policy of the Central Government, it would be necessary for the Provincial Government to approach the Government of India for obtaining a measure of protection to such of the industries as may have to face foreign competition.

Ten Commandments for Foremen

1. Size up each worker under your immediate direction and learn his or her characteristics and abilities.

2. Train each person under your immediate direction so that you can trust them to perform efficiently without accidents, whether or not you are present.

3. Analyze and plan each job so that before the actual work operations are undertaken you, as boss, have clearly in mind the sequence of operations, know how you want each job to be performed, and are fully aware of every hazardous situation which may occur.

4. Assign the workers to tasks based on your knowledge of their ability to perform safely. Wherever there is a special hazard, the supervisor should be certain that the worker assigned has the knowledge and skill required to do the work safely.

5. Make available all necessary tools and equipment, and make certain that they are in good condition.

6. On special jobs, consider carefully such points as shutting off power in special cases, use of extra protective devices and equipment, etc.

7. Give specific and definite instructions, and be sure that these are understood.

8. Check the work in process and in completion to make sure that directions have been properly carried out.

9. Correct or report immediately any hazardous feature discovered in general plant conditions, tools and materials.

10. Conduct yourself so that you are an example of safety to every employee on the job.—*Industrial Supervisor.*

REVIEWS

The Lancashire Textile Industry, 1944. Published by John Worrall Ltd., Oldham, England. Price: 21*s*. post free.

Paper shortage accounts for the new war-time size and binding of this well-known annual which is now in its 59th edition. This has become an approved work of reference to the cotton trade and its contents remain unchanged, while the mill information has been thoroughly revised and brought up to date. It contains full particulars of all cotton, wool, silk, and rayon spinners, manufacturers, bleachers, dyers, finishers, and other branches of the industry, fully indexed and classified. The number of spindles in Lancashire is given as 34,867,192 mule and ring, 1,826,111 doubling, and the number of looms 419,949.

India Arms for Victory. By G. W. Tyson, C.I.E., Editor of *Capital*, Calcutta. Published by Kitabistan, Allahabad. Price: Rs. 5-4-0.

The story of the mobilization of Indian industry in the cause of the war effort is one of engrossing interest but few of the books that have been written on the subject are of outstanding merit. Mr. Tyson's book, first published in 1943, is an exception. Written authoritatively and objectively, it received an excellent Press and has now gone into a second revised and enlarged edition. In this edition the story has been brought up to date. Several new chapters have been added and facts and figures revised. Man-power and Finance are among the new subjects discussed at length in this edition.

Mr. Tyson describes again how the Supply Organization has been built up over the war years until to-day it is the largest of the Government of India's civil enterprises and how the commercial manufacturing capacity of the country continues to be harnessed to the production of war stores and munitions. He devotes one chapter to the Indian cotton mill industry and brings out the vital nature of its contribution to the war effort and describes how its war activities have created new avenues of profitable employment in subsidiary trades and occupations like tailors, *mochees* (cobblers), rope-makers, supervisors, etc. The importance which the war has given to the "little man" is also duly emphasized. India's small industries have been integrated by the war and some of the advantages thus gained must survive into the peace. It may confidently be expected that the Indian craftsman will emerge from the war richer in rupees and experience.

Empire Cotton Growing Corporation, 9 Kingsmere Road, Wimbledon Common, London, England: A Review of the Work of the Experiment Stations in the Seasons 1939-40—1941-42. Price: 2*s*.

The above review gives the reader a more or less connected narrative providing a summarized description of the objects in view, the means taken to attain them and the progress made in the relevant period by the several experiment stations of the Association. A summary of information on the general conditions prevailing in relation to the industry in a particular country, highly desirable as a background to the work described, has been included in those cases where it has been provided. Since it is essential to the purpose of the review that it should be brief, much laborious work receives but brief mention or even none, and an attempt has been made to emphasize conclusive rather than inconclusive results as being more immediately interesting.

Industrial Research. By F. Russell Bichowsky, 1942. Published by Chemical Publishing Co. Inc., Brooklyn, N.Y., U.S.A. Price: $2.50.

There are now over two thousand industrial laboratories in the U.S.A. spending over a quarter billion dollars a year, and research has virtually become a sizable industry all by itself. An attempt has been made in this book to display the social importance of such research and to outline those general principles of management and organization which have proved successful in the laboratory.

NOTICES

Empire Cotton Growing Corporation: Annual Report for 1942-43.

In his review of the past year Lord Derby, as President of the Empire Cotton Growing Corporation, whose annual meeting was held in

Manchester recently, referred to the fact that the cotton crop of 1942-43 in the Colonial Empire (including the Sudan) was the smallest for many years past. This was mainly attributable to the much smaller Uganda crop.

The crops of Uganda and the Sudan are so much larger than all other Empire crops as a rule that they have a preponderant effect on the total figure. For this reason a substantial recovery was at one time looked for in the total figure for the season 1943-44, when it was known that the acreage planted in Uganda was almost equal to that of 1941, but the weather conditions were unfavourable owing to lack of rain, and the crop prospects deteriorated considerably in consequence as the season advanced.

Considerable attention was being devoted to the development of activities after the war, and in this connection Lord Derby gave prominence to the assistance received from the Scientific Advisory Committee. The most important part of their work continued to be concerned with the arrangements for establishing the new Central Cotton Research Station which the Corporation had decided to place in Uganda.

Within the last few years the Imperial Government have given considerable attention to the need for research work of many kinds in the Colonial Empire; in this connection particular interest is attached to the Report of the Colonial Research Committee, which emphasizes the difficulty of pursuing research work of the high standard necessary so long as present conditions are allowed to persist; they point out that scientists in the Colonies have frequently to work in isolation and with relatively inferior equipment; that many of them have to combine with routine investigations such research work as they can find time to do, and that there is a tendency for research problems to be dictated too exclusively by local and temporary interests without due regard to scientific possibilities. For many years the Corporation have repeatedly called attention to these obstacles to effective, high-class research work in the Colonies.

Mysore Commerce (Organ of the Mysore Chamber of Commerce, Bangalore), Vol. I, No. 1. Annual Subscription: Rs. 12-0-0.

The Mysore Chamber of Commerce was publishing until recently a "Weekly Market Report and Bulletin," which satisfied the business man's need to a large extent. But market reports only reflect the sum total of the prevailing economic, political and social conditions, and they do not help the commercial man to understand the complex forces which lie behind market movements. This deficiency is made good by the fortnightly journal which has now superseded the *Market Report* of the Mysore Chamber. The journal is intended to serve the industrial and commercial community in particular and the public of Mysore State in general. In the era of planning that is ahead, we are informed, *Mysore Commerce* will strive to promote understanding between the public and the Administration of the State.

Federal India and Indian States (All-India Industries Supplement). Edited by Mr. H. Srikantia, Visvesvarapuram Circle, Bangalore City. Price: Re. 1-0-0.

The object of the Supplement under notice is to focus public attention on the various problems of planning and development which would arise when the war ends. The editor hopes to make this supplement a half-yearly production. It contains messages of goodwill from several prominent personalities connected especially with Mysore and is profusely illustrated. We have no doubt succeeding numbers of the supplement will amply fulfil the promise held out by this first number.

The Andhra Chamber of Commerce, Madras: Annual Report, 1943. The Andhra Chamber of Commerce in Madras has been growing more and more influential and, with an increase in the volume of work to be done, they had to appoint a whole-time paid assistant secretary. They also received the gift of a library of 1,000 commercial and allied books from their President, Mr. Narayandas Girdhardas.

We have received from the **Indian Central Cotton Committee Technological Laboratory** copies of spinning test reports on carded and combed samples of the following cottons:—

Surat 1027 *A.L.F.* and *A.R. Kampala, Bailhongal Jayawant* and *A.R. Kampala, Hubli Jayawant* 1941-44, *Bagalkote Jayawant* 1943-44, *Miraj* 1935-44, *Westerns* 1943-44, *Viramgam* 1943-44, *Sind M.*4 (saw-ginned) and *A.R. Kampala, Bailhongal* 1935-44, *Broach B.D.* 8 1943-44, 289*F* (saw-ginned) and *A.R. Kampala, Surat* 1941-44, *Bijapur* 1933-44, *Punjab-American* 4*F* 1929-44, *P.A.* 4*F* (*Bahawalpur*) 1943-44, *Verum* 1940-44, and C.P. No. 1 (1935-44), as well as technological report on *Umri Bani* 1943-44.

J. K. Review, Vol. 4, No. 12, includes an interesting article on labour officers by Mr. R. G. Gokhale of the Millowners' Association, which is well worth reading.

Photoelectric Tristimulus Colorimetry with Three Filters. Published by the U.S. Department of Commerce, National Bureau of Standards, New York, U.S.A.

The photoelectric cell is finding ever-widening use in scientific apparatus. The above publication describes the development and use of an "artificial eye for colour measurement," which consists of a barrier-layer photocell and three selected spectral filters. The distinguishing feature of a photoelectric tristimulus colorimeter is the approximate spectral equivalence of the filter-photocell combinations of the apparatus and the tristimulus specifications of the spectrum which characterize the colour vision of the average normal observer. Because of this approximate equivalence, the new apparatus will respond to colour differences in much the same manner as the normal human eye. Excepting cases in which the present lack of ideal spectral equivalence introduces errors which cannot be tolerated, the photoelectric tristimulus colorimeter described herein can be used to measure both the size and the character of colour differences. The potential speed and relative simplicity of the apparatus suggest its use in quantitative studies of colour tolerance. Whenever suitable colour standards are available, the same advantages recommend the use of the apparatus for tests of materials for compliance with colour specifications.

Indian Mill Finance

Working of Textile Companies

Kothari Textiles, Ltd., Singanallur

(Agents : Kothari & Sons, Madras)

The result of the company's working for the year ended 30th June 1944, after allowing depreciation of Rs. 1,00,000, is a profit of Rs. 18,39,251-4-4, to which is added the amount brought forward from last year's account of Rs. 37,035-12-5. From this is deducted the amount appropriated for provision for taxes of Rs. 15,91,337-3 and the amount appropriated for reserve fund of Rs. 1,49,750, leaving a balance of Rs. 1,35,199-13-9.

The Directors recommend appropriating the same in the following manner :—To pay a dividend at 6 per cent. per annum (free of tax) on the preference shares for the year ended 30th June, 1944, amounting to Rs. 18,000 ; to pay a dividend at Re. 1-8 (free of tax) per share on the ordinary shares for the year ended 30th June 1944, amounting to Rs. 75,000 leaving a balance of Rs. 42,199-13-9 which they recommend carrying forward to the next year.

The company's relationship with labour was satisfactory. Under the recommendations of the Southern India Millowners' Association, dear food allowance was increased to 110 per cent. in proportion to the rise in the index number of foodstuffs.

Berar Manufacturing Co., Ltd., Badnera

(Agents : Kasturchand Dadabhoy & Co., Bombay)

The directors state that during the year ending 30th June 1944 the company has made a net profit of Rs. 15,69,443-1-8. Adding to this the amount of Rs. 6,653-8-5 brought forward from last year there remains a credit balance of Rs. 15,76,096-10-1 which they propose to appropriate as under :—Provision for taxation Rs. 11,96,000 ; provision for compulsory deposit under E. P. T. Ordinance No. XVI of 1943 Rs. 3,29,000 ; payment of dividend at the rate of Rs. 15 per share free of income-tax Rs. 41,250 ; balance to be carried forward to next year's account Rs. 9,846-10-1.

As the mills had made substantial profits the management decided to pay for the year under report also a war bonus under certain conditions to all employees who were on rolls during the year at the rate of one-fourth of their total earnings for the period of 1st July 1943 to 30th June 1944.

The mill and dye house premises and all other buildings, machinery and stock-in-trade and all other property belonging to the company have been fully insured against fire, war and riot and civil commotion risks. The profit and standing charges have also been insured against fire and civil commotion risks.

Binod Mills Co., Ltd., Ujjain (including The Deepchand Mills)

(Agents : Binodiram Balchand)

The working of the company for the year ended 31st December, 1943, shows a profit of Rs. 64,29,979-11, to which is added a sum of Rs. 2,17,511-4-4 brought forward from last year's account making the total profit of Rs. 66,47,490-15-4. From this amount a sum of Rs. 10,21,742-7 as agents' remuneration and commission on sales is to be deducted, as also depreciation on fixed assets and provision for taxation on profits is to be made.

This result has been achieved in spite of labour trouble and a very acute shortage of coal. There was also an acute water shortage on account of which the dyeing and the bleaching departments remained partially closed for many days.

Nearly 25 per cent. of their looms are working on Government war orders and 30 per cent. on standard cloth.

In view of good profits made by the company a payment of three months' wages or 25 per cent. of the annual basic earnings was made to all the workpeople and the staff by way of bonus which amounted to Rs. 2,42,882-15-3.

One sterilizer and sprinklers in absorbent cotton department and loom shed have been purchased and added to the mills in the year under report :—

The directors recommend that the net profit of Rs. 56,25,748-8-4 be disposed of as under :—Dividend proposed to be paid for the year ending 31st December, 1943 at Rs. 111 per share Rs. 22,20,000 ; depreciation for building Rs. 4,00,000 ; machinery Rs. 6,00,000 ; furniture Rs. 10,000 ; Deepchand Mills building Rs. 1,08,000 ; Deepchand Mills machinery Rs. 2,00,000 ; Binod Ginning Factory Rs. 10,000 ; Binod electric installation Rs. 20,000 ; Deepchand electric installation Rs. 8,000 ; Motor cars and lorries Rs. 18,000 ; and dead and live stock Rs. 5,000 ; provision for taxes Rs. 2,00,000 ; dividend equalization fund Rs. 2,50,000 ; reserve fund Rs. 10,54,677-8; anti-gas department Rs. 35,000 ; reserve for bad and doubtful debts Rs. 50,000 ; provision for workpeople's building fund Rs. 2,75,000 and to carry forward Rs. 1,62,071-0-4.

The mills building and machinery together with cotton, yarn, cloth, stores and waste, etc., for both the mills are at present insured against fire for Rs. 1,59,44,500 and against profit and outstanding charges for Rs. 20,00,000.

Khatau Makanji Spinning and Weaving Co., Ltd., Bombay

(Agents : Khatau Makanji & Co.)

The account for the year ended 30th June 1944 shows a profit of Rs. 1,25,03,030-13-8 to which is to be added the carry forward balance from last account of Rs. 26,418-5-5 which makes available the total of Rs. 1,25,29,449-3-1. From this amount an interim dividend of Rs. 10 free of income-tax per ordinary share was paid during the year absorbing Rs. 2,99,250, leaving a balance of Rs. 1,22,30,199-3-1. The directors have made allocations from this amount as under :—To building depreciation Rs. 83,000 ; to machinery depreciation Rs. 2,57,500 ; to provision for taxation account Rs. 1,15,00,000 (including deposit) Rs. 1,18,40,500, leaving a balance of Rs. 3,89,699-3-1 to the credit of profit and loss account. The amount is to be distributed as under :—Dividend on preference shares at

Rs. 6 free of income-tax per share for the current year Rs. 60,000 ; dividend on ordinary shares at Rs. 10 free of income-tax per share for the current year Rs. 2,99,250 leaving a balance of Rs. 30,449-3-1 to be carried forward to the next year.

During the year under report orders were placed for new machinery of the approximate total value of Rs. 3,07,789.

The mill buildings, machinery (boilers excepted) and stock-in-trade at Bombay and up-country have been insured against fire, riot, and civil commotion risks for Rs. 3,62,76,298 and profit and fixed charges are insured at the sum of Rs. 55,00,000 against like risks for a period of 24 months. The company's stock including buildings and machinery have also been insured under the Government of India War Risks Insurance Ordinance.

Sri Krishnarajendra Mills, Ltd., Mysore

(Chairman : M. S. Ramachandra Rao)

The company's working for the year ended 30th June 1944 has resulted in a profit of Rs. 16,53,397-13-11. This is the result for an effective working period of only about 6½ months, the remaining 5½ months having been lost partly on account of a labour strike and partly owing to the serious breakdown in electric power supply.

From the above profits have been charged for depreciation on fixed assets for the year ended 30-6-1944 Rs. 2,01,380-13-7 and for provision for income-tax and super-tax Rs. 5,60,000.

This leaves a sum of Rs. 8,92,017-0-4 which with the carry-forward of Rs. 12,020-10-8 from last year amounts to Rs. 9,04,037-11-0. There is also a sum of Rs. 5,783-5-4 transferred from the reserve for bad and doubtful debts to general reserve, representing sums recovered against bad and doubtful debts. Of this total sum of Rs. 9,09,821-0-4, the directors have made the following appropriations :—General reserve Rs. 2,06,000 ; dividend equalisation fund Rs. 1,00,000 ; raw materials fluctuation reserve Rs. 75,000 ; reserve for heavy replacements of plant and machinery Rs. 2,50,000.

This leaves a balance of Rs. 2,78,821-0-4, from which a sum of Rs. 1,10,091 was paid as interim dividend at 6 per cent. for the half-year ended 31-12-1943 and the directors now recommend payment of a final dividend at 6 per cent., (making in all a dividend of 12 per cent. for the year) and a bonus of 3 per cent., both free of income-tax, on each paid up share. This will absorb a sum of Rs. 1,65,136-8 and leaves a balance of Rs. 3,593-8-4, which will be carried over to next year.

The total of the reserve funds so far built up amounts to Rs. 18,81,000.

The mills' buildings, machinery and plant, stocks and stores are insured for a sum of Rs. 38,92,243.

Mysore Spun Silk Mills, Ltd., Channapatna

(Manager : K. Shamsuddin Khan)

Due to the purchase and installation of some additional machinery for the Spun Silk Mills as well as the noil section of the factory, the production of spun silk and noil yarns increased substantially, thereby placing the factory on more secure basis than before. It is under contemplation to install a few more units for the noil department.

The Government of Mysore had established a silk filature of 40 basins in the premises of the mills on certain terms. During the year under report, the company has purchased it from Government and undertaken to expand it further by the installation of 160 basins more with a view to manufacture parachute silk to be supplied to the Government of India for war purposes under the silk filature expansion scheme. One hundred and twenty of the additional basins have been already erected and the remaining are under erection. The construction work is progressing satisfactorily.

The combined working of the spun silk factory and the filature in the year 1943 has resulted in a net profit of Rs. 6,31,208-11-3 after meeting the depreciation on all the fixed assets for the year. Adding to this the sum of Rs. 2,453-13-6 which was carried forward from previous year's profits, the total amounted to Rs. 6,33,662-8-9. After making the necessary provision for income-tax and super-tax, the net profit available for distribution amounts to Rs. 4,57,880-4-9. An interim dividend at the rate of As. 8 per share amounting to Rs. 45,764-2-0, was declared and paid in October last, thus leaving a balance of Rs. 4,12,116-2-9 which the directors propose to dispose of as follows :—To credit to reserve fund bringing the total to Rs. 3,00,000, Rs. 1,82,615-8-0 ; reserve for fluctuation in the value of raw materials and for heavy replacements of plant and machinery Rs. 1,00,000 ; dividend equalisation fund Rs. 50,000 ; dividend at As. 8 per share (5 per cent.) free of Mysore income-tax for the second half year making a total of 10 per cent. for the year Rs. 47,643 ; bonus to shareholders at As. 4 per share (2½ per cent.) for the year free of Mysore income-tax Rs. 23,821-8-0 ; and to carry forward to next year Rs. 8,036-2-9.

Moradabad Spinning and Weaving Mills Co., Ltd. (and Reduced), Moradabad

(Agents : Alakhdhari & Sons)

During the year 1943 the company made a profit of Rs. 7,73,799-15-7 which is disposed of as follows :—Appropriation for depreciating the cost of mill buildings, machinery, furniture and railway siding at rates sanctioned by the Government Rs. 22,948-6 ; paid for war risks insurances Rs. 14,999-4 ; bonus of 3 months' pay to mill employees Rs. 20,133-12 ; net profit carried over to the balance-sheet Rs. 7,15,718-9-7.

Ad-interim dividends of Rs. 56 and Rs. 28 (total Rs. 84) have been distributed to the shareholders. Pending assessment of income-tax, the balance at credit in the profit and loss account should, in the directors' opinion, be held in reserve and carried forward.

The company is striving to rely in an increasing measure for the manufacture of spare parts and equipment on its own workshops.

Free medical relief and educational facilities are provided for the mill employees and their dependents.

The mill buildings, machinery and stocks are fully insured against fire risks. War risk insurances of the mill property have been duly effected.

NEWS OF THE MONTH

Indian

Cost of Living Index in Bombay.—During August, 1944, the working class cost of living index number for Bombay, with the average prices for the year ended June 1934, equal to 100, was 250. This was nine points higher than in the preceding month. The index number for food articles advanced by 17 points to 287.

Fire in Seksaria Cotton Mill.—Damage estimated at about Rs. 50,000 was caused by a fire which broke out in the Seksaria Cotton Mill at Tulsi Pipe Road, Bombay, on 18th September 1944.

Ten fire engines from different stations brought the fire under complete control within an hour. The Salvage Corps and the police also rendered help.

Labour Inquiry Committee.—It is understood that the Labour Investigation Committee, the Government of India, is conducting a wage census only in the textile industry, under the supervision of Mr. R. P. Maheshwari. The object of this inquiry is to recommend to the Government of India reasonable and minimum wages in mills and factories.

Consumption of Cotton by Indian Mills.—The Indian cotton mill industry consumed in July 341,521 bales of Indian cotton as compared with 385,015 bales in the same month a year ago. The total consumption of Indian cotton by mills during the 11 months ended July is 3,767,077 bales as against 3,929,437 bales in the corresponding period of the previous year.

Bombay Colour and Chemical Merchants' Association.—A meeting of colour and chemical merchants was held in the office of Messrs. Chatrabhuj K. Mavji at 70, Vadgadi, last month under the presidentship of Mr. Ranchhoddas Karsondas Rangwala, when the Bombay Colour and Chemical Merchants' Association was established to start a movement for the licensing of the dealers and safeguarding their interest in fast dyes. The following office-bearers were unanimously elected:—

Messrs. Ranchhoddas Karsondas Rangwala (President), Chotalal Dwarkadas Mehta (Vice-President), Purshottamdas Girdharlal and Muljibhai Somabhai (Joint Secretaries), and Kantilal N. Shah (Treasurer and member of Committee).

Textile Calendar

OCTOBER

5th, Thursday :
Second Quarterly Meeting of the Textile Stores and Machinery Merchants' Association, Bombay.

13th, Friday :
Quarterly Meeting of the Textile Control Board in Bombay.

19th, Thursday :
Bombay Union Dyeing Mills Silver Jubilee Celebrations, Mr. D. M. Khatau presiding.

26th, Thursday :
Government of India's Policy Committee on Trade and Industries meets in Bombay, Sir Ardeshir Dalal, Kt., presiding.

27th and 28th, Friday and Saturday :
Sixth Plenary Labour Conference meets in New Delhi.

NOVEMBER

10th, Friday :
The V. J. T. Institute Textile Association, Paper on Researches carried out at the Institute by Prof. D. F. Kapadia, B.A., M.Sc. (Tech.)., Sir Sorab Saklatvala presiding, at Electric House, Fort, Bombay.

Government Subsidy for Hand-spinning.—With a view to developing hand-spinning in the famine centres at Gudur and Yemiganur in the Bellary and Kurnool districts, the Government of Madras have sanctioned the payment to the Rayalaseema Moola Khadi Prathisthapanam, Tadpatri, of a grant of Rs. 4,626 for the training of 200 spinners at the two centres for a period of six months and a maximum subsidy of Rs. 366 and Rs. 1,625 on the quantity of yarn and cloth respectively produced during the latter half of 1944-45. They have also sanctioned for the purpose to the Prathisthapanam a loan of Rs. 4,000 at 3½ per cent. per annum repayable at the end of three years from the date of disbursement.

Increase in Number of Workers Employed in Factories.—The various Indian industries were, on an average employing 24,37,246 workers daily in 1943, as against 22,82,237 in 1942, according to the annual statistics of factories collected in the Labour Department of the Central Government.

The Government and local fund factories employed 355,873 men in 1943, as against 299,893 in the previous year; in the case of all other factories, the number rose from 19,82,344 in 1942 to 20,81,373 in 1943.

The largest number of men were employed in Bombay, where the figure for daily average employment stood at 7,11,525. Industries in Bengal employed 6,95,043 men, while those in Madras employed 2,62,347.

Extending Scope of Technical Departments in the V. J. T. Institute.—The Government of Bombay have sanctioned a scheme for the extension of the Mechanical and Engineering departments of the Victoria Jubilee Technical Institute, Bombay, in accordance with the 15-year plan for post-war development in the province.

The scheme, which involves a capital expenditure of about Rs. 8½ lakhs and a recurring expenditure of Rs. 1,75,000 spread over a period of five years, provides for an increase of 50 per cent. in admissions to both the departments.

The scheme will take effect immediately and will enable the Institute to train a very much larger number of students and also to provide facilities for the type of training best suited for the immediate post-war needs of the province.

Fifteen-Year Plan for Mysore State.—A comprehensive plan for the economic development of Mysore, involving an expenditure of Rs. 200 crores in 15 years, on the same lines as the Bombay Plan and the Plan for the Economic Development of India, has been submitted by Mr. P. H. Krishnarao, Commissioner for Development and Planning in Mysore, to the Mysore Government.

A special committee with Diwan Bahadur K. R. Sreenivasa Iyengar as Chairman has been constituted by the Government to examine the scheme in detail and submit its report.

The plan contemplates all-round progress of Mysore State under the heads agriculture, including forestry, fisheries and sericulture ; trade, commerce and industry ; public works and communications ; electric power and social services, including education, medical relief and public health, housing and social security. Under each section the conditions in Mysore are considered against the background of Indian conditions.

The Mysore Plan aims at catering for two-thirds of the entire population of the State living in 3,700 villages each with a population of over 500.

Interim Dividends Declared by Cotton Mills.—At a meeting of the Directors of the Barsi Spinning and Weaving Mills Ltd., held in Bombay on 19th September 1944, it was decided to pay an *ad-interim* dividend of Rs. 15 per share (ordinary) free of tax, to the shareholders whose names stand in the company's register on the 27th September 1944.

At the meetings of the Directors of the Vishnu Cotton Mill Ltd., and the Lakshmi Cotton Manufacturing Co., Ltd., held in Bombay on the 3rd October 1944, it was resolved that an *ad-interim* dividend of Rs. 8 and Rs. 25 respectively per ordinary share free of tax, be paid to the shareholders whose names stand in the company's register on the 21st October 1944.

The Directors of the Central India Spinning, Weaving and Manufacturing Company, Ltd., have decided to pay the following final dividends to the shareholders for the year ended 30th June 1944 :—Rs. 12-8 per share on preference shares and Rs. 10 per share on ordinary shares.

The Directors of the Ahmedabad Advance Mills, Ltd., have decided to pay the following final dividends to the shareholders for the year ended 30th June 1944 :—Rs. 2-8 per share on preference shares and Rs. 10 per share on ordinary shares.

Shuttle Manufacturing Company in Bombay.—A company named the Modern Shuttle Manufacturing Co., Ltd., has been formed with its Registered Office at 15, Forbes Street, Fort, Bombay for manufacturing and dealing in shuttles, bobbins and other wooden textile parts and accessories.

The authorized capital of the company is Rs. 5 lakhs, divided into 50,000 shares of Rs. 10 each.

Mr. M. S. Pandit, one of the directors of the company, agreed in March 1944 to purchase for the sum of Rs. 48,000 from the proprietors of Messrs. Modern Shuttle Manufacturing Co., Dadar, Bombay, the machinery together with stores and the right to use the name of "The Modern Shuttle Manufacturing Co.". From a valuation made by a director of the company, Mr. P. N. Agate, who is a chartered engineer, it appears that the present value of the said machinery and stores alone would exceed Rs. 80,000. The company has therefore agreed to purchase the said machinery together with stores and the right to use the said name from Mr. Pandit for Rs. 48,000.

The machinery is at present lying at Bhavnagar, but the directors propose to shift the same to Bombay at a very early date after obtaining the necessary permission from the Government. Until such permission is received the company proposes to work at Bhavnagar.

Co-operative Plan for Industries: Start Made in Bombay.—A comprehensive scheme for the mobilization of India's resources by the establishment of industrial co-operatives on the Chinese model is being worked out by a group of public workers in Bombay.

The "Indusco" line, which formed the backbone of the defence manœuvres of China, is one of the little known aspects of the Chinese defence against Japanese aggression. Myriads of mobile co-operative production units constitute a special feature of the Chinese industrial organization. Not only could these units be quickly rebuilt in the event of damage or destruction by air raids, but also offer the largest scope for the employment of disabled soldiers.

An Industrial Co-operative Association, it is learnt, has been formed in Bombay with a view to establishing India's small industries on a co-operative basis. Among the main objects of the Association is to see that workers are safeguarded from the financier, the promoter, the manager and the middleman. Shareholders must work in the co-operative and a mere money share is not allowed.

At present, the activities of the Association are limited to the Province of Bombay. Co-operatives of hand-made paper manufacturers and leather workers are being organized.

Among the public workers who are actively associated with the organization of industrial co-operatives are Mr. V. L. Mehta, Mr. L. N. Renu, Mr. Maurice Frydman and Mr. L. Gopala Rao.

Foreign

Manchester University Accepts I. C. I. Offer.—The University of Manchester has accepted an offer by Imperial Chemical Industries, Ltd., to provide eight Research Fellowships for a period of seven years The value of the Fellowships will normally be £600 each a year and they will be offered in chemistry or physics and related subjects.

U. S. S. R. Silk Output.—Silkworm cocoon cultivation in Takzhikistan, in the Soviet Union, has been expanding steadily in the past few years, according to a Russian publication. An adequate number of silk-worm eggs were produced this year so that 3,000 baskets were delivered beyond the borders of Takzhikistan to Uzbekistan, and 10,000 baskets were released to recently liberated areas in the Ukraine and Russia proper. Prior to 1943, silk-worm eggs had to be obtained from neighbouring republics, and in 1943 the domestic production was sufficient only for the Republic's own breeders.

Wilson Brothers Bobbin Co., Ltd., England.—The directors' report of this well-known firm of bobbin and shuttle makers of Garston, Liverpool, for the year ended 15th July, 1944, states that after providing for all trade charges and reserve for taxation, the net profit of the business amounts to £26,587 16*s.* 8*d.*, which, added to the balance brought forward from the previous year of £1,534 4*s.* 5*d.*, makes a total of £28,122 1*s.* 1*d.*, which the directors recommend should be appropriated as under :—A dividend of 6 per cent. on £285,000 (subject to income-tax) £17,100, transfer to reserve fund (making a total of £45,000) £10,000, and carry forward to the credit of next year's account £1,022 1*s.* 1*d.*

Mr. William Arthur Robinson, Manager of their Indian Branch, has been elected a Director of the company.

Government Grant to Shirley Institute, Manchester.—Speaking at the annual meeting of the British Cotton Industry Research Association recently, Dr. F. C. Toy, the new Director of the Shirley Institute, Didsbury, England, said that as soon as the urgency of war work fell off the Institute would turn its attention to the problems concerning the future, and had in view developments which he believed would be of value to the cotton industry. Mr. H. Parkinson, Honorary Treasurer, pointed out that a Government grant of £35,000 had been made to the Institute. This was the maximum amount the association was able to earn under the existing agreement, and it was entirely due to the overwhelmingly generous response to his appeal for additional subscriptions during the year. He asked for £8,000, but every section of the industry responded so well that the amount received was £15,541.

Imports of Raw Cotton into United Kingdom and Piecegoods into India.—The following final statement shows the imports of raw cotton into the United Kingdom from India and of cotton piecegoods into India from the United Kingdom with reference to Article 10 of the United Kingdom—India Trade Agreement, 1939 :—

	Bales of 392 lbs.
Net imports of raw cotton into the United Kingdom from India during the "Cotton Year" ending 31st December 1943	137,737
	Yards.
Gross imports of cotton piecegoods into India from the United Kingdom during the period 1st April 1943 to 31st March 1944	3,283,512
Re-exports of cotton piecegoods of United Kingdom origin from India during the same period	446,536
Net imports of cotton piecegoods into India from the United Kingdom during the "cotton piecegoods year" ending 31st March 1944 ..	2,836,976

Cotton Mission Report.—Mr. Lyttelton, the Minister of Production in the British Cabinet recently stated that he had received the report of the Lancashire Cotton Mission to the U. S. A. and that the question of making it public was being considered. There is great interest in the report in all sections of the industry, and it is generally hoped that nothing will cause the Government to withhold it from publication. It is felt that the mission which Sir Frank Platt took with him must have pursued its investigations closely and expertly and that its report cannot fail to contain much plain speaking on essential points.

It is realized that there are many radical differences and many minor ones between the British and the American cotton textile industries. Some of the differences are perhaps not widely known or appreciated, and it is hoped that the report will not only call attention to all of them but that it will also show which of them works to the advantage of the United States and the extent of any such advantage, what changes they suggest for a long-term policy for Lancashire, and what changes could be made now to increase war-time production. In some quarters it appears to have been forgotten that the object of the mission was to find means of increasing Lancashire's current contribution to the textile supplies of the United Nations.—*Manchester Guardian.*

Callender's Cable and Construction, Ltd., England.—The 48th annual general meeting of Callender's Cable and Construction Co., Ltd., was held on 3rd July in London. The directors' report stated that the profit, after providing for taxation, depreciation and directors' fees came to £465,115. Adding to this the balance of £306,552, brought forward from the previous year, the total available came to £771,667. Dividends paid during the year upon both classes of Preference stock, and an interim on the Ordinary stock, amounted to £112,196, leaving a sum of £659,471.

The directors after careful consideration as to how to deal with this amount had decided to transfer to reserve for war contingencies, etc., the sum of £175,000, earmarked as a contingent reserve for reinstatement of employees in the fighting services, under the Reinstatement in Civil Employment Act, 1944, to pay a final dividend upon the Ordinary stock of 10 per cent., absorbing £112,391, and, in addition, a cash bonus of 5 per cent., both less tax, on all the issued Ordinary stock, which would take another £56,196. These altogether totalled £343,587, leaving a balance to be carried forward of £315,884 —an increase of £9,332 on the preceding year.

It was proposed that a further sum of £175,000 be added to the reserve for the "equalization of dividends or for war contingencies" which last year was made up to half a million.

W. T. Henley's Telegraph Works Co., Ltd., England.—At their annual meeting held on 30th June in London, Sir Montague Hughman (Chairman) said that a considerable proportion of the work which they were doing at present was quite outside their ordinary peace-time business. They had been able to render fine war service by the manufacture on an extensive scale of special requirements some of which were the results of their own inventions.

After referring to the institution of the company's non-contributory sickness and accident benefit scheme, Sir Montague said that the works councils had continued to function very well and afforded an admirable means of bringing the management and the workpeople together. The rubber cable works, the paper cable works and the engineering department had been busily employed and he congratulated the managers, Messrs. McArthur and Judge, on the results. The research and technical departments had done excellent work during the year. Sir Montague recalled that the company organized research laboratories twenty-five years ago.

The Chairman reviewed the accounts and said that the balance on trading account was £438,209. The profit for the year shows an increase of approximately £18,000 compared with 1942. During the year approximately £61,000 was spent on the maintenance of the plant.

The report and accounts were unanimously adopted and the meeting sanctioned the declaration of the final devidend of 10 per cent. and 5 per cent. cash bonus making with the interim dividend 20 per cent. for the year.

U.S.A. Textile Research Groups Agree in Planning Efforts.—An understanding has been reached by representatives of the American Association of Textile Chemists and Colorists and of the Textile Research Institute, at a recent meeting, to avoid any danger of duplication of effort by discussing with one another new research projects to determine any possible interference.

The Textile Research Institute proposes to undertake research work, both fundamental and applied, on all phases of textile manufacture. The American Association of Textile Chemists and Colorists is primarily concerned with the wet processing of textiles and is pre-eminent in the development of standard test methods for the use of the textile chemist, dyer, colourist, finisher, converter and consumer of textiles. The two organizations have a common interest in the promotion of knowledge of textiles through research, but their programmes do not overlap and through voluntary co-ordination will avoid any possibility of duplication.

Accordingly, the industry should not hesitate to provide financial support in behalf of the research work of both organizations in proportion to the interest in their respective programmes.

F. S. Blanchard, President of the Textile Research Institute, and Giles Hopkins, Chairman of its Applied Research Committee, represented the Institute at the meeting. W. D. Appel, President of the American Association of Textile Chemists and Colorists, Hugh Christison, Vice-President, P. J. Wood, past President and Leonard Little, Chairman of its Executive Committee on Research, represented the A. A. T. C. C.—*Cotton Trade Journal.*

On Managing Agents

"The custom of leaving the whole control of a joint stock mill in the hands of a man without any technical knowledge of spinning, weaving or dyeing and who, in addition, has private commercial interests that may often be antagonistic to those of the mill and the shareholders, has received careful consideration, and the result has been an agitation for a change in the laws affecting the responsibilities of mill agents, which, it is to be hoped, will add much to the security of the investing public."

Lancashire's Post-war Plans

IN the period between the last war and this the British cotton industry has been steadily contracting owing partly to general world depression, partly to Japanese competition, and partly to the rise of new cotton manufacturing countries like India and Brazil. In view of its vital importance as the major export industry of England its decline has been seriously exercising the minds of the authorities, who have been busy lately planning for its reconstruction in the post-war period. Some time ago a special committee of the Cotton Board in England submitted its plans for the development of the industry and Government's reply to it was published only recently. They believe that the adoption of a five-point programme which they have outlined would put a period to continued shrinkage in employment, in output and in exports in the Lancashire textile industry and thus avert what might turn out to be a " disaster to Lancashire and Britain." The five points relate to: amalgamation of spinning units to bring about more efficient and financially strong units; re-equipment; overhaul of merchanting side in order to enable the producing sections to achieve economies of continuous runs and bulk production; modification and simplification of the wage-structure; and extension of double shifts, without which " installing of modern machinery will not in many cases be justified."

The report of the Cotton Board Committee was released much earlier. It recommended that there should be established a compact cotton board after the war and its powers would include the registration of firms engaged in the industry, collection of levies and administration of price-management schemes, administration of redundancy or excess capacity schemes, collection of statistics, and promotion of scientific and industrial research; it is to inherit the many duties of the board appointed under the Cotton Industry (Reorganization) Act, 1939, which was suspended on the outbreak of the war. The Committee thinks that the best that Lancashire could look forward to in the post-war period is an increase of 5 per cent. in domestic demand and an increase in export demand of half as much again as the 1939 level, which is the same as the 1932 level. This export demand could be met by the existing spinning mills (including those which were closed under the concentration scheme), but it would have excess capacity in the weaving and finishing sections, which would have to be met by making the installation of new looms conditional on an equivalent number of old looms being scrapped and by collecting a levy from the finishing section to compensate those who choose to drop out. It is feared, however, that the labour force available at the end of the war might not exceed 70 per cent. of that of 1939, making it difficult, therefore, to reach even the 1939 level of production. The Cotton Board Committee therefore urges the speedy introduction of reforms to make the industry more attractive in respect of security of employment, methods of training and conditions of work. It may be possible, however, to minimize the efforts of labour shortage by the adoption of labour-saving machinery and suitable reorganization of the industry. In the first five years after the war the British industry would require £43,000,000 worth of new machinery according to the Committee's estimate. Among the recommendations made in this connection are that Government should give textile machinists early relief from war work, assure priority to the home trade, and arrive at an understanding about prices and requirements of imported machinery. " Post-war requirement," the Committee observes, " is not one problem to be met by one solution, but a continuing and vitally important element in the total problem of maintaining an efficient and successful industry," and its solution can only be " continuing collaboration between cotton manufacturers, machinists and Government." Describing the work of the Shirley Institute, Manchester, the Committee refers to several new machines for spinning which were on trial and suggests that the Cotton Board should devote funds for experiments on a mill scale. It urges Government to give the industry early relief from all burdensome taxes, particularly the Excess Profits Tax.

In a supplementary resolution the Cotton Board Committee expresses its opinion in favour of larger groups, formed voluntarily and pursuing common policies, in the spinning section of the industry, since it would facilitate the task of re-equipment and reorganization. The Committee is at the same time convinced that a system of managed prices, providing for both maximum and minimum prices, is the very foundation of any plan of reorganization or reconstruction. In the course of his presidential address at the latest annual meeting of the Manchester Chamber of Commerce, Mr. Frank Longworth defined price-management as a " system which, after ensuring a satisfactory wage for the workers and a reasonable return to the producers, would provide for the greatest possible flexibility above that; in other words, a minimum price which is fixed having due regard to efficiency and subject to safeguards in the interests of the consumer and the national economy." While maximum prices are expected to be a useful weapon against inflation, the industry considers minimum prices indispensable (Mr. E. A. Carpenter, of the Cotton and Rayon Merchants' Association, Manchester, compares their value to that of a life-belt in a perilous sea), if manufacturers are to sink vast capital sums in re-equipping and otherwise improving the efficiency of the industry before entering upon the highly competitive era of the post-war period. But Government are believed to have already rejected the industry's plea for statutory minimum prices because they might, in their opinion, lead to restriction rather than expansion and to the perpetuation of inefficient and old-fashioned methods by some firms.

The report of the Cotton Board Committee has received wide publicity. The British Government have asked the Committee to amplify and develop the subject of supplies and requirements of plant and equipment as dealt with in its report. The outstanding importance of Lancashire's throwing all energies into modernizing plant and increasing output with economy of labour force is stressed by the *Manchester Guardian*, which considers the Cotton Board's programme of re-equipment totally inadequate, it being no more than 8½ per cent. of the value of the capital invested in the industry. " And this after five or six years of no replacement at all and several decades of little replacement and modernization." It points out further that, though the report is keenly alive to the need for extensive replacement of machinery, for stimulating textile machinists to improve their designs, for better labour methods and for giving technical research its due place in the industry, it does not point out how American cotton mills are technically superior to Lancashire's. And the report of the Platt delegation to America, which has since been released, has only confirmed England's worst fears; in almost every department the American industry is proved to be infinitely better equipped and more efficient than its English counterpart. There is also general regret that the Cotton Board Committee has failed to discuss the kind of post-war exports—whether the contemplated increase is to be in quality production or in the cheaper lines. As the *Manchester Guardian* points out, " the hope for Lancashire's survival lies in the industry becoming more textile-minded (in the widest sense) and not more cotton-minded."

The Cotton Board Committee's report and the British Government's orders on it are of special interest to the Indian cotton mill industry, which has now for nearly 18 months been under official control and is likely to continue to be so controlled for a fairly long time after the war. The British Government's rejection of the plea for managed prices, the Cotton Board's reluctance to enforce compulsion whether in buying out redundant plant or in bringing about larger units of production, and the general agreement on the necessity for a co-ordinated re-equipment programme are points whose significance the Indian industry should not fail to note.

Government Assistance to Cotton Textile Industry

A Positive Policy Wanted

By P. C. JAIN, M.A., M.SC. (*Econ.*) *London, University of Allahabad*

(*Specially Contributed*)

THE Government policy with regard to the Indian cotton textile industry, as to all other industries, was one of complete *laissez faire* in the pre-1939 period. Due to the war, and more especially from the middle of 1943, the Government of India have been compelled to give up this policy of indifference and inactivity. But the chief aims of war-time controls have been to safeguard the interests of consumers, to make the necessary cotton textile goods available to the Defence Services, and to conserve such scarce raw materials as coal and chemicals. It is doubtful whether the war-time controls, unless they are continued in peace-time on systematic lines, would have much lasting effect on the organization of the Indian cotton textile industry. The changes that have taken place in the channels of cloth distribution, the range of output and the technique of production may fade out if the industry is left to its own resources in the post-war period. Such, however, appears to be the intention of the Government of India if the disinclination of the Textile Commissioner to commit himself beyond the war period and the absence of Government schemes for the post-war rehabilitation of the cotton textile industry are taken into account.

It is not necessary at this late stage to prove the necessity for Government's adopting a positive policy towards the Indian cotton textile industry. The thing is self-evident. The principle of *laissez faire* which was evolved in 1776 is now out of date. The British Government has long given it up and has evolved a plan for the post-war reconstruction of the British cotton textile industry in which the Government would play a predominant part. We ask for nothing more than a similar policy for India. It would be our task in this article, without bewailing for past neglect of our interests, to point out the way in which the Government of India can help the cotton textile industry to reconstruct itself, and in this we shall closely follow the scheme evolved in Great Britain. The problems facing the cotton textile industries in the two countries are very much alike and we see no reason why the Government of India should not do for the Indian cotton textile industry what the British Government proposes to do for the British industry.

Machinery

One of the most pressing needs of the Indian cotton textile industry in the immediate post-war period would be the modernization of machinery. Due to high pressure working the technical equipment in our cotton mills, some of which was already half a century old when the war started, has depreciated at a much faster rate than would have ordinarily been the case. It is reliably estimated that for profitable operation in the post-war period nearly 50 per cent. of the spinning and weaving machinery will have to be replaced. The important point is that the Indian textile manufacturers, in the changed conditions of machine-supply expected to prevail in the post-war period, cannot effect this replacement of machinery unaided. It is only through Government effort that an adequate supply of textile machinery would be available to us. It is not only a question of paying the price but of obtaining priorities with the manufacturers of machinery in the U.K., U.S.A., and other countries and arranging for the necessary amount of foreign exchange. The priorities can only be secured by agreement with the respective Governments in these countries and the Government of India is best fitted to take up these negotiations.

According to one estimate, the American cotton textile industry would require at least 16 million new spindles for replacement purposes in the immediate post-war period since out of 23,846,000 spindles in operation in 1943 nearly 68 per cent.

were more than 20 years old. But the American textile-machine industry at present levels of capacity cannot supply more than 8 lakh spindles per year. The textile-machine output in the U.S.A., therefore, will not be enough to meet even the internal demand, but it is reported that out of consideration for the foreign markets it is proposed to allot 10 to 15 per cent. of this output for export. There will be a great scramble for securing part of this supply and the Government of India has no time to lose if it has to give effective assistance to the Indian industry. The same is the position in Great Britain where it has been estimated by an official committee, through inquiries made of a representative cross-section of firms, that in five years after the end of hostilities textile machinery worth £43 millions would be necessary for purposes of replacement and renovation. The British textile-machine industry, which has still to supply some orders booked earlier, cannot cope with this huge demand. Special efforts would, therefore, be necessary on the part of the Government of India to induce the Board of Trade to allot a reasonable quota of textile machinery to the Indian mill industry. In the absence of this special effort the Indian textile mills are not likely to get any machinery at all for few years in the post-war period. This would not only ruin our textile industry but would have very adverse effects on Government tax revenue, the consumers, and the growers of cotton in this country.

Apart from this, the Government of India's sympathetic attitude is needed in enabling the cotton mills to accumulate adequate reserves for post-war replacement of machinery when considerably higher prices will have to be paid. This would involve a provision for more liberal depreciation allowances than are at present in force. The Bombay Millowners' Association submitted a revised scheme suggesting to the Government the grant of depreciation allowances at the rate of 10 per cent. for single shift, 20 per cent. for double shift, and 25 per cent. for three shifts operation. This scheme is reasonable, provided account is also taken of the much higher prices that will have to be paid for textile machinery in the post-war period. The purpose of a depreciation fund is to build up adequate reserves to be able to replace the machinery when it is discarded, and no purpose will be served if the depreciation fund is one-third or one-half of the price to be paid for new machinery. Moreover, let the Government of India earmark a higher proportion of the E.P.T. proceeds for the post-war reconstruction of the textile mill industry. This is necessary in view of the special difficulties which this industry is bound to face in the post-war period.

This would solve the immediate problem but from a long period point of view it is necessary to manufacture textile machinery in our own country. We already possess considerable experience in making cruder types of machinery and the technical training received by our workmen during war-time along with our potential resources in steel, hydro-electric power and minerals should enable us to set up an efficient machine manufacturing industry on modern lines. The Indian industrialists would be able to set up such an industry if they are assured of getting the requisite type of machine-manufacturing equipment and technical assistance from foreign countries. The Government of India's help is needed in obtaining them. In a free market the Indian industrialists themselves would have secured these, but since the supply of machinery will be under control for a considerable time in the post-war period the imports of machinery and technical skill would not be available without Government intervention on behalf of the Indian mills.

Internal Organization

Another important matter in which Government help would be necessary is in putting the internal organization of the cotton textile industry on sound lines. The Indian manufacturers have shown an individualistic attitude, as has very much been the case in Great Britain, and a central organization has not come into existence even when it would have been in the best interests of the industry because some dissenting producers have chosen to stand out of these negotiations. In Great Britain the Cotton Industry (Reorganization) Act, 1939, provided for statutory enforcement of schemes of reorganization and price management if a majority of the mills agreed to these arrangements. The Cotton Board Committee on British industry in its report early in 1944 emphasized the urgent need of fixing maximum and minimum prices for piecegoods and yarn in peace-time in continuation of war-time controls so as to prevent cut-throat competition between the suppliers and rise of prices due to inflationary tendencies. The Committee made it clear that it disapproves of "price management in terms of groups of producers meeting in secret and fixing prices to protect the high cost producer," but it fully supported price fixation under Government supervision as that would strengthen the industry by preventing the evil consequences of weak selling. In the "Five-Point Programme" for the British cotton industry announced by the British Government in September 1944, the first item is the bringing about of such amalgamations, particularly in the spinning section, as are required to secure efficient and financially strong units. The British cotton textile industry has evidently made adequate preparations to face the post-war problems.

We in India, on the other hand, are as yet thoroughly unprepared although the necessity of post-war planning has been constantly emphasized. In this country there are far too many inefficient mills and, in spite of war-time standardization of output, they produce a large number of types and designs of cloth which necessarily imposes high costs of production. There have been innumerable examples of cut-throat competition in the pre-1939 period. What is worse, the producers have failed to come to an agreement among themselves but this was only to be expected in view of a similar experience in Great Britain. It is only through Government action that the organization of the cotton textile industry can be improved. Let the Government of India announce a definite programme for the Indian cotton textile industry after taking the manufacturers into full confidence and giving all the interests involved an opportunity of representing their case to the Government. A Cotton Industry (Reorganization) Act might be passed giving statutory sanction to the proposed scheme and the Textile Control Board, in a revised form and with adequate representation of the manufacturers and other interests concerned, might be retained in the post-war period to operate the scheme.

The exact details of the scheme will have to be settled after careful investigations but it is possible to indicate some of the points which such a scheme would cover. The demand for Indian-made cotton goods would be subject to fluctuation but the Textile Control Board would so adjust production that it would not exceed the expected market demand. This will prevent overproduction and the consequent evils. In order to achieve this result the Textile Control Board would have power, subject to adequate safeguards, to order the closing down of any particular mill, or some sections of it, which in its opinion is redundant and whose operation is not justified by the existing market demand. Or alternatively it might be necessary to wind up some mills altogether. In either case, adequate compensation would be paid to the owners of these mills. Secondly, the number of types and designs of cloth will have to be fixed ; it is by no chance necessary to fix them once and for all but changes would be introduced from time to time in the light of experience. Such standardization of output would enable large-scale operation at lowest costs. It would also be in the interest of the consumers who would thereby be saved the additional botheration and cost of a multiplicity of designs. Thirdly, with full care for the interests of consumers and labourers, minimum and maximum prices would be fixed for all lines of production. The object of maximum prices would be to prevent losses to consumers from inflation of prices due to scarcity of goods while the object of minimum prices would be to prevent losses to producers due to low prices resulting from cut-throat competition, recession in demand, and trade depression. The war-time experience of price fixation would prove of immense value in this task and a much greater control on the distribution of cloth would have to be enforced than is at present the case, in order to make price control policy successful. Fourthly, in order to ensure smooth working of the scheme the Textile Control Board will have to be given power to fix adequate wages and conditions of work for operatives in the cotton mills and to recommend to the Government the fixation of suitable prices for raw cotton, mill stores, and chemicals, etc., by their respective Control

Boards. In the absence of fixed wages and raw material prices it would not be possible to lay down and enforce the price at which cotton cloth and yarn may be sold. Finally, the Textile Control Board would maintain a central research institute which would undertake research on behalf of the cotton mills and would give advice on technical matters that arise. The funds for the running of this research institute will be paid partly by the Government and partly by the cotton mills.

It is only a far-reaching control that would solve the problems facing our cotton textile industry. A partial control, as has been our experience in many instances in India and other countries, could make matters worse ; it might create more problems than it would solve. And as we have already emphasized, a policy of *laissez faire* is completely out of date and it is at our great peril that the Government of India can think of adhering to such a policy. This would be seen in its proper perspective if we compare the unpreparedness of the Government of India with the comprehensive industrial plans which the Governments in other countries propose to adopt. In a world full of planned development any country which follows a policy of indecision and drift and adheres to archaic theories would inevitably be ruined.

Import and Export Trade

Due to war conditions the imports of cotton piecegoods into India declined from 647 million yards in 1938-39 to 3.6 million yards in 1943-44 while the exports increased from 177 million yards in 1938-39 to 819 million yards in 1942-43. The exports in 1943-44 declined to 461½ million yards due mostly to efforts made by the Textile Control Board to check exports in view of cloth scarcity in the home market. It is worth realizing that these changes in the imports and exports of piecegoods are only temporary features due to war-time conditions and it is not right to read too much into them, but at the same time some of these changes may be worth stabilizing, if we can afford to do so, in the post-war period.

If the imports increase in the post-war period, as they are bound to do if things are left to themselves, they would deprive the Indian mills of the internal market to that extent. This would not be in our best interests as the productive capacity of our cotton textile industry has expanded and we have to find markets for its output. We are not recommending a suicidal policy of self-sufficiency. We shall import some special types of cloth, and also the common varieties on a reciprocal basis, but there is no doubt that an indiscriminate influx of cloth into the Indian market has to be prevented. In order to achieve this result the Government of India will have to make use of protective tariffs and quota schemes of quantitative control. The tall talk about freeing international trade from restrictive measures in the post-war period cannot close our eyes to the realities of the situation. The other Governments, especially those of U.K. and the U.S.A., while talking of freer trade, have schemes ready for the quantitative control of trade in the post-war period as is evident from the reports of a number of official committees recently published and the statements made by a number of Government officials, industrialists, and business people in these countries. It would be futile and ruinous for the Government of India to adhere to free trade when other countries of the world have no intention of doing so. The important point is that, awaiting developments, the Government of India should also have plans of import control ready so that they might be introduced at the proper time without delay.

During the past five years we have exported cotton piecegoods to a number of countries which were formerly supplied by others. In the post-war period these other suppliers would surely make a bid to recapture these markets and to some extent we shall have to yield place to them. But it is perfectly possible to hold some of these markets if a proper export policy is adopted. In order to retain these markets we shall have to supply them goods of the right quality and finish at competitive prices. A study of consumer tastes in these markets, a minute attention to quality and finish, and sale at competitive prices would enable our textile industry to hold some of these markets. The Cloth and Yarn (Export Control) Order, 1944, would to some extent help us in this task but the effort envisaged by this Order is

(*Continued on page* 82)

Post-war Industrial Development in India

Sir Ardeshir Dalal Explains Government Policy

THE first meeting of the Policy Committee for Industries set up by the Government of India was held in Bombay on Thursday the 26th October 1944, Sir Ardeshir Dalal, Kt., Member for Planning and Development, presiding.

Among those who attended the meeting were the Hon'ble Sir Jeremy Raisman, Finance Member ; the Hon'ble Sir A. Ramaswami Mudaliar, Supply Member ; Sir Chintaman Deshmukh, Governor of the Reserve Bank ; Mr. I. H. Taunton, Adviser to the Governor of Bombay; the Hon'ble Mr. K. Shahabuddin, Minister of Bengal; Lt.-General Sir Thomas Hutton, Secretary, Planning Department; Sir Akbar Hydari, Secretary, Industries and Civil Supplies Department; Sir Theodore Gregory, Economic Adviser to the Government of India, and other officers of the Central Government, Provincial Governments and Indian States; Sir Purshotamdas Thakurdas, Mr. J. C. Setalvad, Mr. J. R. D. Tata, Dr. John Matthai, Mr. G. D. Birla, Mr. N. R. Sarker, Mr. R. A. Khedgikar, Sir Padamji Ginwala, Mr. Kasturbhai Lalbhai, Mr. Walchand Hirachand, Sir Padampat Singhania, Sir Shri Ram, Dewan Bahadur C. S. Ratnasabapathi Mudaliar, Mr. Dwarka Basi and Mr. Bishen Das Basil.

THE HON'BLE SIR ARDESHIR R. DALAL, KT.

Post-war Re-equipment

"In the absence of sufficient data," observed Sir Ardeshir in the course of his opening address, "it has not been possible to make any provisional reservation for capital equipment other than electrical. The war in Europe, however, is drawing to a close, and industrial capacity in the U.K. and U.S.A. will be gradually switched over to civilian requirements. There is likely to be a tremendous rush of orders from the devastated countries and elsewhere on the books of both these countries. It is necessary for industrialists in India, therefore, to book their requirements for capital goods as early as possible. The Government of India are considering this problem and will shortly issue a *communique* on the subject. Government do not propose to canalise the orders, which may be booked direct. But the orders should be registered with Government. Such registration will be provisional for a period not exceeding three months from the date of application, and if no objection is raised by Government within that period, the orders will automatically be confirmed, if this has not already been done specifically. A report will be required as soon as firm orders are placed; if no such report is received after six months of confirmation of the orders by Government and extension is not requested, the registration will be cancelled.

"It is proposed to set up organizations, both in the U.K. and U.S.A., and possibly elsewhere, to help industrialists in this country in securing these goods. Those who fail to register their orders will receive no assistance from Government and will not be eligible for import licences, for the import of such goods into India.

"It may be argued that the procedure here suggested is inconsistent with ordered planning. There will, however, be control, although at this stage it will be a general and negative control. Registration will be refused in cases where the industrial development contemplated is obviously uneconomic, or leads to over-concentration of certain industries in certain areas. The existing capital issues and import controls will also, of course, remain. In the beginning and before an industrial plan is ready, it is not advisable to hold up development. The volume of industrial development contemplated is so large that no great harm can be done by the booking of orders at this stage when the volume of capital goods available in many categories is not likely to be equal to the demand.

"In the case of orders on the U.S.A., dollar exchange will, of course, have to be arranged. The volume of dollars available till the termination of the war and until some arrangement is made, if possible, for a dollar loan, is likely to be limited, and to that extent it will be necessary to see that the more essential requirements for capital goods receive priority over the less essential ones. The exact procedure to be followed will be laid down in a notification to be issued shortly."

The Planning Member announced that "the Government of India are contemplating a liberalisation of the existing protection policy and the elimination of some of the conditions attaching to the grant of protection to industries. They are also contemplating a permanent Tariff Board. A suggestion for consideration is the creation of a permanent board on a very high level which would deal not only with questions of protection to industries. but also with all questions of industrial development, investment, licensing of factories, etc., in the post-war period. The provinces and States would, of course, have to be represented on a body like that."

The Planning Member stated that the main object of the meeting was to seek advice, guidance and co-operation on the lines of industrial development, and observed: "We have necessarily set a high target before us, but I am sure you will agree that it is a practical one." He referred to the speeches made by the Secretary of State for India reiterating the view that His Majesty's Government would like to see Indian industries developing to the fullest extent, and suggested that "as practical men, we accept these assurances and go ahead with the problem of industrial planning." Sir Ardeshir said it was proposed to set up a number of panels for investigating the problems of development of individual industries or groups of industries.

Industrial Committees

The provinces had been asked to set up industrial committees of their own. The list of panels, as circulated, was a tentative one. It was proposed to attach to each one of the panels one or more experts as well as a permanent officer of the Planning Department. No panel would be necessary for the cotton textile industry, as, in the Control Board, which had been set up by Government, there was a fully representative organization which was capable of dealing with the industry. In other cases, where fully representative and authoritative associations representing any particular industry existed, the same procedure might be followed.

"There are certain other industries," Sir Ardeshir continued, "as, for instance, cement, where the problems are fairly straightforward and the information already at the disposal of the Supply Department is so complete that it may not be necessary to constitute any panel. On the other hand, there are industries involving highly complicated technical processes where it is felt that no single expert could give advice which would be of more than very general assistance regarding the setting up of such industries. This applies, in particular, to industries such as shipbuilding, aircraft, manufacture of large electrical machinery, plastics and dyestuffs, etc. Individual firms will make their own arrangements with regard to such industries. The panels for such industries can only make general recommendations as regards their feasibility and location. It is the intention not only to start new industries and to maintain and expand the existing ones with the help of imported machinery, but to make as far as possible such machinery in this country.

"The question of small-scale and cottage industries also requires careful consideration. A machinery for dealing with many of the small-scale industries already exists in the Supply Department, and their problems will have to be considered in consultation with that Department.

"Regarding cottage industries, we will have to rely to a large extent on the recommendations of the Provincial Industrial Committees.

"In view of the somewhat poor response to inquiries from Government regarding industrial matters received so far, I may perhaps explain that in the formation of this Committee and the panels and in any statistics that may be required, no trade or business secrets are wanted and no confidential information, likely to be of use to others, need be discussed. The only object is to try to help industrial development.

Question of Controls

"We have so far dealt with the more immediate problems of industrial development. Among the larger issues of policy is the question of controls. There is at present a control over capital issues as well as imports. ***Planning by its very nature implies control and regulation, and even after the war, so long as planned development is the objective, controls must remain.*** Legislative measures will have to take the place of the present controls imposed under the Defence of India Rules when the existing emergency is over. Among such measures as will engage the attention of Government will be one of licensing of factories, as it would be difficult to secure the very important objective of regionalization of industries without licensing. This is, however, a long-term measure. Many constitutional questions of great importance will arise after the war in dealing with industries *vis-a-vis* Provinces as well as States. It is premature to discuss those problems now, but it may not be out of place to state that if centralised control is desired, it can best be achieved by agreement and co-operation with the parties concerned."

Sir Ardeshir invited suggestions on the question of the participation of Government in the ownership, management and control of industries. There were certain industries, such as munition works, which in the national interests, should be owned by the State, but there were others which might not afford sufficient attraction to private capitalists. In that event, they would have to be owned by the State, but the management might be either by the State or by private firms. The sulphate of ammonia industry was a case in point. There was also the question of the ownership and/or management or control of public utilities.

"Speaking for myself," remarked Sir Ardeshir Dalal, "I am not the captive of any theories or 'isms.' The final criterion to my mind is public interest. From my experience as an industrialist, I am convinced that private initiative and enterprise have still a large part to play in the development of industries. ***One thing, however, appeared to be certain, that the State would have to take a more active part and exercise a greater measure of control over industries than it had done in the past. The object of industrial development is not to make the rich richer but the country richer."***

In conclusion, Sir Ardeshir stated that what applied to the provinces also applied in a large measure to the States. The question for consideration was one of the extent to which, and the machinery under which, the States could bring themselves under the same controls regarding industrial development as existed in British India.

Government Assistance to Cotton Textile Industry

(*Concluded from page* 79)

very inadequate and a more thorough-going policy would have to be adopted. A special department of the Textile Control Board should be made responsible for developing the foreign markets by means of all the known devices. In addition to this, the Government of India will have to enter into bilateral or multilateral trade agreements with countries where these export markets exist so as to induce them to take our cotton piecegoods in exchange for goods which we would buy from them.

Sixth Labour Conference: Trends in India's Labour Legislation

By S.K.R.

(Specially Contributed)

THE sixth Labour Conference held at New Delhi on the 27th and 28th October last has been a very important one on account of the weighty nature of the subjects discussed there. Several subjects were on the agenda, of which the more important were: (1) Compulsory insurance of liability under the Workmen's Compensation Act, 1923; (2) statutory machinery for fixation of minimum wages; (3) organization of employment in the transition from war to peace; (4) revision of the Trade Disputes Act, 1929; and (5) participation of States in sickness insurance scheme for industrial labour in India. Yet another item suggested by the Labour Member to the Government of India, who presided over the Conference, was even more important than the other subjects. He suggested vital changes in the constitution of the Conference and its Standing Committee to ensure better consideration of labour problems and policies. All these subjects, it will be realized, have very far-reaching effects on employers and workers; a brief review of these will, therefore, facilitate an appraisal of the implications and repercussions of each on these interests.

Compulsory Insurance

Though the Committee of 1922 conducting preliminary examination on the Workmen's Compensation Bill (which became an Act in 1923) was pessimistic about insurance of liability under the Workmen's Compensation Act, opinion and practice in more recent times seem to favour the desirability of instituting compulsory insurance. A few of the Provincial Labour Inquiry Committees have stressed the need for this innovation and during the last few years bigger employers have voluntarily insured their liability under the Act with insurance companies. But the smaller employers have not done so, and several of them have been adopting obstructionist tactics to put off payment of compensation to injured workmen. There have been several cases in which men of straw have been employed as labour contractors, from whom it is impossible to get any compensation. And workers have not the necessary legal help or finance to fight out their claim and, therefore, prefer to accept a very much reduced amount out of court.

Yet again, even with sufficiently big employers cases may arise in which large claims from workmen arising simultaneously might create embarrassment and lead to default of payment. Compulsory insurance, therefore, not only protects the employer against heavy financial demands but also, at the same time, safeguards the workers. During the last few decades several countries with social insurance systems have made insurance of liability under Workmen's Compensation compulsory. India too has already introduced the principle in practice, for, the War Injuries Ordinance of 1941 makes insurance of employers' liability under it compulsory. The proposal to have a State insurance scheme is reported to have received the support of the Government and workers' representatives at the Conference.

Minimum Wages

The Government of India took up seriously the question of establishing machinery for the fixation of minimum wages in 1943 ; the subject has already been under discussion at two meetings of the Standing Labour Committee as also at the Plenary Session of the Labour Conference held in 1943. These discussions favoured the setting up of machinery in the form of Regional Wage Boards. The Government of India invited the Conference to discuss questions of detail like the composition of the wages boards, the functions of these boards and the effect to be given to their decisions.

Wages as a cause of industrial disputes in India have been the biggest single factor in industrial relations. Wages have been fixed arbitrarily and changes in them have depended on the comparative strength and bargaining power of the employer and the employed; neither party could support in most cases its thesis for a change based on scientific economic data, and even in cases of a rise or fall in the cost of living, the amount of increase or decrease respectively in wages demanded was quite arbitrary. Hitherto wages, thus, have had no relation to cost of living or standard of living at all. The violent economic changes as a result of the present war have brought the problem now into the melting pot. The rapid rise in the cost of living and inadequate labour supply have been responsible for erratic rises in wages and varying rates of dearness allowance. In the transition from war to peace, prices are bound to fall and direction of production to change, but any sympathetic lowering of wages might lead to widespread industrial disputes. The only way to avoid such unsettlement as would retard India's plans of production expansion and rise in standard of living, will be to correlate wages to cost of living on a scientific basis, so that wages automatically rise or fall up to a certain minimum necessary to enable workers to maintain themselves as human beings. It is only by this means that neither party can settle disputes about wage rates and levels.

Post-war Employment

The organization of employment in the transition from war to peace was one of the important items on the agenda of the 26th session of the I. L. Conference and the discussions there resulted in the adoption of a detailed recommendation setting out certain general principles to guide nations in organizing full employment. To plan well, the recommendation has suggested the collection of relevant information being started even now; suggestions have also been made regarding the procedure regarding demobilization of armed forces, and industrial demobilization and conversion; it has also stressed the importance of exchanges in handling employment problems, and the organization of vocational guidance, training and re-training programme. Certain special problems are envisaged as likely to arise, like employment of young workers, women and disabled workers and regularization of employment in particular industries. Among the immediate objectives of social and economic policy in post-war reconstruction, that of full employment has increasingly assumed the central place, because it is on full employment that raising of standard of living has to be based. Planning of organization of transition employment cannot but have the most beneficent results on industrial development and raising standard of living in India. The I. L. C. recommendation on full employment, however, is part of a much bigger general scheme, and it is to be hoped that the Government of India will soon examine the I.L.O. scheme of post-war reconstruction in its entirety to see how far and to what extent it is suited to India.

Amendment of Trade Disputes Act

The importance of perfecting machinery to prevent industrial disputes and to settle disputes as expeditiously as possible when they cannot be prevented, cannot be overemphasized in a country like India. The Central Government adopted a rudimentary Trade Disputes Act in 1929 ; that it was found very inadequate to meet the situation is seen by the adoption in Bombay of supplementing Acts in 1934 and 1938, and in the proposal of some of the provinces to adopt the Bombay Industrial Disputes Act, 1938, in their own areas. Moreover, in Bombay, all the three Acts are in force in patches. The war has further complicated the situation by the new procedures and obligations prescribed under rule 81A of the Defence of India Rules. It is, therefore, necessary to adopt a measure of all-India application now and for the future, incorporating the provisions of the existing enactments and rules in India which have been found successful in application, and to fill up the present lacunæ, especially as regards arbitration, and, thus adopt an up-to-date and progressive enactment which will not only prevent but speedily settle all trade disputes with the least loss to the industry and to workers. It is not surprising that opinion in the Conference was not unanimous on all the Government proposals. The Conference was unanimous that conciliation methods should be further extended and that Standing Orders in industries should be enforced by legislation. On the point of compulsory arbitration, however, employers and a section of workers offered opposition.

Sickness Insurance

Prof. Adarkar's report on the institution of a sickness insurance scheme in India was made available to the Conference; this scheme has recommended a State contribution of As. 8 per worker per month, made up of six annas from Provincial Governments and two annas from the Central Government. He has made recommendations regarding employers' and workers' contribution and other aspects of sickness insurance but the Conference discussed only the question of State contribution to the fund. A major difference between employers and the Government in the earlier discussions on a sickness insurance scheme for India was regarding the subject of State contribution; the employers argued that in several countries the State was contributing to sickness funds and that without financial help and support from the State, the burden on employers would be too heavy. The Government's objection was that in so far as the contemplated sickness scheme covered only the small section of industrial workers, a State subvention for such a small class was creating an invidious distinction. In view of Prof. Adarkar's recommendation in favour of State contribution, it is to be hoped that Government will now accept the principle.

Constitution of the Labour Conference

In his opening speech the President referred to the unsatisfactory nature of the present constitution of the Labour Conference and the Standing Labour Committee in that there was no clear demarkation of the functions of both. He suggested that the Conference should confine itself to general questions of policy and legislation, leaving to a Labour Welfare Committee to be set up to consider specific questions relating to restricted aspects of conditions of work. The Standing Labour Committee is hereafter to investigate and report on problems referred to it by the Conference or Government. He also discussed the constitution of a Labour Welfare Committee to consider welfare problems and the setting up of a permanent secretariat on the model of the I.L.O. These proposals had not yet been fully examined by the Government of India and when such examination is over, the results are to be placed before the Conference for discussion.

Special Rations for Manual Workers

The Conference is also understood to have discussed the question of granting special rations for heavy manual workers. It has now been widely recognized that the common yardstick of rationing should not apply to heavy manual workers and that this section should be granted special rations. In fact, supplementary rations have been sanctioned for heavy manual workers but there is always the difficulty of determining who fall into this class, because a mere rule-of-thumb provision is likely to lead to serious abuses. The United Kingdom has solved the difficulty by cutting out the system of supplementary rations and by making wholesome food available to all workers in industrial canteens. In India too the Central Government and, through its initiative, Provincial Governments have been making sustained efforts to popularize factory canteens where clean and wholesome food is made available at reasonable rates in addition to the worker's rations. With such canteen facilities, there is no reason why heavy manual workers should not get food according to their needs.

Art-in-Industry Exhibition 1945

THE Art-in-Industry Exhibition organized by Burmah-Shell which is to be held in the Sir J. J. School of Art, Bombay, early next year, will include a section in which outstanding 1944 productions in the field of advertising, commercial art and industrial design will be shown. Entries are solicited from manufacturers, advertising agents, commercial art and press art studios, professional artists, advertisers, process studios, printers and interior decorators which will be selected on artistic merit and technical excellence of production. Further details may be obtained from the Sir J. J. School of Art, Bombay.

India's Export Trade with East Africa

Indian Government Trade Commissioner's Report for 1942-43

THE Cotton Textiles group continued to be an important item of trade imports with East African Territories. During 1942, the value of cotton textiles was £1,703,261 or 12 per cent. of all imported goods in the case of Kenya and Uganda, £1,236,620 or 33.5 per cent. of all imported goods in the case of the Tanganyika Territory and £96,574 or 9.3 per cent. of all imported goods in the case of Zanzibar Protectorate.

India supplied 88 per cent. of the cotton textiles imported into Kenya and Uganda, 93 per cent. of those imported into the Tanganyika Territory and 72 per cent. of those imported into Zanzibar Protectorate.

The position of India, as well as other important sources of supply, in the imports of each of the main categories of cotton textiles is summarised below :—

Imports into Kenya and Uganda

Cotton Piecegoods: Grey, Unbleached.—In sympathy with a decline in the total imports under this category, imports from India also fell from 36,453,906 linear yards valued at £651,170 in 1941 to 18,222,238 linear yards valued at £563,293 in 1942. Besides India, the United Kingdom was the only supplier of any significance. With regard to grey sheetings and grey drills, it is generally felt that these very important lines in piecegoods will, in every likelihood, continue to remain in the hands of the Indian exporters, since it was only Japan which could beat India in the past. There is not much possibility of the United Kingdom manufacturing this type of goods and even if it were so, India could stand in competition with her. American drills, which had gained popularity in Africa, were of heavy type suitable for use in *dhows*. These drills were known as Peperell drills. It is necessary, with a view to capturing the post-war market, that India should also supply similarly heavy types of drills of standard weights.

Bleached.—Imports from India amounted to 2,100,852 linear yards valued at £77,777 in the year 1942 as compared with 4,196,563 linear yards valued at £94,447 in the preceding year. The United Kingdom was the other chief source of supply. India has been supplying these goods for nearly four years and various qualities have been marketed, but up till now standard qualities and numbers have not been popularized. These goods used to come in the pre-war period largely from the United Kingdom and Holland.

Printed (other than Khangas).—Imports from India amounted to 3,715,024 linear yards valued at £135,480 in 1942 as compared with 7,464,932 linear yards valued at £195,861 in the preceding year. The United Kingdom was the other principal supplier. Although India is supplying these goods in fairly large quantities, all this business is possible because the United Kingdom cannot, under the existing conditions, supply this line freely in sufficient quantities. In spite of India getting a chance of trading in this line for the last four years, the Indian manufacturers have not fully studied the actual requirements of these markets, and have not standardized any goods. Printed cotton piecegoods of Indian manufacture are being sold at random in the East African markets without the dealers asking for repeats. The merchants buy whatever goods are available in the market. Unless, therefore, the Indian manufacturers pay special attention to the actual requirements of these markets, it is apprehended that business in this line might slip away from their hands in the post-war period.

Printed Khangas.—Imports from India amounted to 209,485 linear yards valued at £5,957 in 1942 as against 254,586 linear yards valued at £6,478 in the preceding year. The other source of supply of no less importance was the United Kingdom. As a matter of fact, this line of business is very important so far as East Africa is concerned, but it is a pity that the Indian manufacturers have not paid any attention to it. Although some consignments of hand-printed khangas have been imported from India, the work was not satisfactory. It is very essential that this line of trade should be properly studied. This business is done usually by European manufacturers on the basis of designs submitted by East African merchants. The manufacturers study the design and work out their cost on the minimum of a 350 scores for 4 border goods and 170 scores for no border or 2 borders. The buyer agrees to take up the required quality at the quoted price, but with a stipulation that the said design becomes the property of the buyers and is not to be offered to anybody else. Again, when the same buyer wishes to repeat the same design, he will be quoted about 3*s*. per score less than the first quoted price. This reduction in price is made possible by the fact that the design is already with manufacturers duly carved. In this way, the buyer always takes the minimum quantities with a consolation that he will take full advantage of his own design. If the Indian manufacturers work on similar lines, they can get good business now and also in the post-war period. So far, none of the Indian mills has seriously thought over this business. Hand printers have done some business with this country in this line, but as they have been supplying the same design to each and everyone, there has naturally been dissatisfaction. The result has been that local printers in East Africa have started work. They are ordering mulmuls from India and doing the printing job locally. This will work all right so long as there is a shortage of English and Continental khangas. When these will reappear, the natives of East Africa are not likely to touch the locally-printed khangas.

Dyed in the Piece.—Imports from India amounted to 2,729,336 linear yards valued at £111,436 in the year 1942 as against 9,093,235 linear yards valued at £243,371 in the preceding year. The chief source of supply was the United Kingdom. In this line of trade, India has so far standardized some qualities in black jeans, blue drills and kanikis and there is every possibility of the business remaining in Indian hands provided they keep up to these standard qualities. It will be interesting to note that these goods were standard goods in these markets even before the last war, but it was Japan only that had ousted India. It is, therefore, most essential that Indian manufacturers should devote special attention to these lines, standardize a number of qualities and thereafter make no alterations therein either in quality or finish. Another item coming under the category of dyed piecegoods is khaki drill. Although some good qualities were imported from India, unfortunately they were never standardized. Once a certain quality came under one brand but when the repeat order was sent, either that particular quality was unavailable or it got deteriorated. This is an important line of business and special regard has to be paid to quality and to fast and uniform colours. Although there is every possibility of Manchester regaining the trade in its standard qualities which are still being imported at cheaper rates than those offered by India, there should still be sufficient scope for India in the post-war period.

Coloured.—Imports from India amounted to 11,431,812 linear yards valued at £436,882 in 1942 as against 24,380,100 linear yards valued at £543,765 in the preceding year. The other source of supply, of far less importance, was the United Kingdom. India is doing at present very good business in this line but the manufacturers have not yet fully studied the designs that were popular in these markets. Some qualities and designs were copied and are selling well. In the case of handwoven goods, stricter control should be exercised over handloom weavers with a view to ensuring standard qualities and weights. Although Holland used to lead in this line of business and that country along with Manchester might endeavour to regain the trade, there is every scope for India to retain a good share of trade in the post-war period.

Cotton Blankets.—Imports from India amounted to 1,084,011 blankets valued at £170,591 in 1942 as compared with 1,333,987 valued at £162,315 in the preceding year. The United Kingdom and China were the two other sources of supply but of comparatively far less importance. India has had a very good chance of business in this line. In pre-war time, Holland was the chief supplier and even Japan could not compete on equal terms with her. Indian cotton blankets are steadily gaining popularity here and there is good scope for retaining this trade even in the post-war period.

Cotton Yarns.—India was the only source of supply. Imports in 1942 amounted to 75,113 lbs. valued at £6,477 against 166,602 lbs. valued at £6,709 in the previous year.

Imports into the Tanganyika Territory

Cotton Piecegoods : Grey, Unbleached.—Imports from India amounted to 12,718,146 sq. yds. valued at £359,865 in 1942 as against 15,309,504 sq. yds. valued at £259,537 in the preceding year. Some negligible quantity was also imported from the United Kingdom.

Bleached.—Imports from India amounted to 1,676,611 sq. yds. valued at £55,830 in 1942 as against 2,292,512 sq. yds. valued at £49,038 in the previous year. The only other source of supply of any significance was the United Kingdom.

Printed Khangas.—Imports from India amounted to 628,582 sq. yds. valued £17,350 in 1942 as against 1,042,660 sq. yds. valued at £23,484 in the preceding year. The trade was shared between India and the United Kingdom in almost equal proportions.

Printed, Others.—The bulk of the trade was with India, imports from which amounted to 4,130,959 sq. yds. valued at £119,302 in 1942 as compared with 6,698,996 sq. yds. valued at £158,055 in the preceding year. The other chief source of supply was the United Kingdom.

Dyed in the Piece.—Imports from India amounted to 7,375,008 sq. yds. valued at £279,720 in 1942 as against 14,915,307 sq. yds. valued at £339,558 in the preceding year. The United Kingdom was the only other supplier of any importance.

Coloured.—Imports were almost entirely from India, amounting to 9,359,883 sq. yds. valued at £324,828 in 1942 as against 10,566,917 sq. yds. valued at £250,395 in the previous year.

Cotton Blankets.—Almost the entire supply came from India, amounting to 34,759 score valued at £102,931 in 1942 as against 21,016 score valued at £44,314 in the previous year.

Cotton Thread.—The bulk of the imports was from India, amounting to 106,688 lbs. valued at £19,103 in 1942 against 225,469 lbs. valued at £30,565 in the previous year. The United Kingdom was the other source of supply.

Artificial Silk Piecegoods.—India supplied 217,277 sq. yds. valued at £12,065 in 1942 as against 906,667 sq. yds. valued at £40,111 in the preceding year. The other suppliers of some importance were the United Kingdom and Hongkong.

Imports into the Zanzibar Protectorate

Cotton Piecegoods : Grey, Unbleached.—India was the only source of supply in the year 1942, imports from which amounted to 229,670 linear yards valued at £8,014 as against 382,745 linear yards valued at £7,891 in the year 1941.

Bleached.—Imports from India amounted to 565,452 linear yards valued at £19,954 in 1942 against 508,678 linear yards valued at £9,161 in the preceding year. India was almost the only source of supply.

Printed Khangas.—India supplied 143,229 linear yards valued at £4,114 in 1942 as compared with 291,874 linear yards valued at £8,404 in the preceding year. The United Kingdom was the most important source of supply.

Printed (other sorts)—Imports from India amounted to 139,003 linear yards valued at £4,107 in 1942 against 974,890 linear yards valued at £22,000 in the previous year. The other supplier of comparatively far less importance was the United Kingdom.

Dyed in the Piece.—Imports from India amounted to 538,144 linear yards valued at £18,086 in 1942 against 830,743 linear yards valued at £22,436 in the preceding year. India had the bulk of the trade, while the United Kingdom, China and Arabia were the other sources of supply.

Coloured.—India supplied 439,654 linear yards valued at £15,518 in 1942 against 498,077 linear yards valued at £11,711 in the previous year. Arabia was the only other source of supply but of comparatively far less importance.

Cotton Blankets and Rugs.—India was the only source of supply, imports therefrom amounting to 12,150 blankets valued at £2,625 in 1942 against 1,607 valued at £145 in the previous year.

In spite of export and import restrictions, it is gratifying to note, says the Indian Government Trade Commissioner in his Report for 1942-43, that India has been able to increase her percentage share in the import trade of East Africa to a very appreciable extent. From a close study of the local markets, it can be stated that a very wide range of commodities, previously obtained from Japan and continental countries, are now imported from India. In 1942, India supplied about 90 per cent. of the cotton textiles imported into the East African territories. These territories form a large market for cotton piecegoods. For some years immediately preceding the present war, Lancashire supplied only about 5 per cent. of the total cotton piecegoods imported into these territories. Japan was easily the largest source of imports, while some came from India. When Japan entered the war, all trade with that country came to an end and it happened that the only manufacturing country of any importance which in these circumstances could supply the textile requirements of East Africa was India ; and the Indian textile industry by no means neglected the excellent opportunity which the war conditions provided.

It would be relevant here, continues the Trade Commissioner, to offer a few suggestions which are likely to prove useful in the interest of India's export trade with East Africa :—

(i) Indian manufacturers should appoint their agencies throughout East Africa or send out capable representatives from time to time to study the requirements of these markets.

(ii) Certain brands should be reserved for leading importers which should not be supplied to others under any circumstances either through Indian shippers or direct.

(iii) Indian manufacturers have so far been doing business on cash before delivery terms. They might examine the advisability of altering it to 90 days D/A terms just as European suppliers are doing.

(iv) Considerable improvement is needed in the bale packing and marking of goods. The Indian manufacturers are at present in the habit of varying their packing in all cases. For instance, when the market is high, the packing is usually small, but when the market goes down the packing is substantially increased. For example, a bale of coating may contain 30 pieces and the same way, at times, be increased to contain as much as 60 pieces.

(v) Special attention should be paid to the stamping of correct dimensions on piecegoods and to the correct declaration of dimensions on the invoices.

(vi) Even in prices of well-established goods there have always been differences in quotations of different mills. This may be unavoidable but such difference should be only nominal or very little.

(vii) It has been found in almost all cases that no goods in the same design or quality are available for repeat orders and the importers have to take substitutes. In such cases all efforts put in establishing a particular quality brand are rendered useless and the importers have to start everything over again.

(viii) Sometimes damaged or rejected goods are mixed up with sound stuff and as a consequence it becomes very difficult for importers to do business with any degree of confidence. Rejected or damaged goods must, therefore, be kept separate.

(ix) Nice and attractive shipment samples should be supplied for each bale in two or three sets, cut out from goods which are actually being supplied.

(x) Indian manufacturers would be well advised to advertise their goods in the East African newspapers.

Vocational Bias in Education: Bombay Government's Proposals

POST-WAR education will have a strong vocational bias, and will be of the basic type recommended by the Central Advisory Board in the Sargent Report. Agricultural primary schools have been in existence for many years in Bombay, and so have basic schools in which spinning has been taught as the principal handicraft. Such schools will be increased in number and other crafts like carpentry, weaving and market gardening will be introduced to suit the environment of each school.

The vocational emphasis will also be extended to secondary education. There are already two technical schools in the province and the post-war plan provides for two more of these, so that there may be one in each Educational Division. The four existing agricultural high schools are to be increased to eight.

Industrial schools are proposed for Satara, Hubli and Bijapur, and advantage will be taken of the numerous technical training centres which have been started in many parts of the province for war purposes. One of the chief functions of these centres will no doubt be to accustom those who have become war technicians to the different kinds of machinery used in peace-time industry and thus help demobilized soldiers to find employment in civil life.

In the higher stages of practical education it is intended to introduce a degree course in textile engineering at the V. J. T. Institute, Bombay, and to reorganize the R. C. Technical Institute at Ahmedabad by providing four-year courses in spinning and weaving and other subjects that are likely to prove useful in a big textile centre.

Australian Woollen Manufactures

Tariff Board Findings on Effects of War

ON 4th April 1944, the Minister for Trade and Customs, Commonwealth of Australia, referred to the Tariff Board for inquiry and report several questions relating to the production in Australia of woven wool piecegoods during the period of the existing state of war. The questions covered by the Minister's reference were made the subject of a public inquiry by the Board, and evidence was tendered by the representatives of the retailers, master tailors, distributors of cloth, wool textile manufacturers, the Federal Clothing and Textile Advisory Council, The Textile Workers' Union, and several Government departments.

The questions referred to the Tariff Board and the latter's findings based on the evidence collected by them are summarized below:—

Tariff Board Findings

Question (a)—What changes have taken place in the quality of worsted and woollen cloths produced by Australian textile mills ?

(1) A number of different classes of cloth with a range of qualities and prices within each class, suitable for and, before the war, widely used in different sections of the clothing trade, are now being produced.

(2) Production of the highest prices and highest quality worsted and woollen cloths produced prior to the control is not now being permitted.

(3) Cloths of quality unsuitable for use at any price which were, before the war, produced in Australia in small proportion of the total manufactured are now, as the result of control, produced, if at all, in negligible quantities.

Question (b)—To what extent are worsted and woollen cloths being produced of a quality inferior to the highest quality permitted by the Control of Woollens Order made under the National Security (General) Regulations ?

(1) The control exercised over the quality of woollen and worsted cloths is elastic, the object being to secure from each mill the largest output of the types and qualities it can best produce.

(2) Cloths produced by different mills and marketed under the same designation and at the same selling price sometimes vary slightly in quality. None of the variations, however, shows a greater departure from the highest approved quality for the particular cloth than is, in the opinion of the Controller of Woollens, justifiable.

Question (c)—How effective is the existing system of control of the production of wool textiles, both piecegoods and yarns, in preventing the manufacture of cloths of unduly low quality ?

(1) The evidence indicates that the Controller of Woollens has effectively used his control over the production of both piecegoods and yarns to prevent the manufacture of cloths of unduly low quality, i.e., cloths unsuitable for use at any price. No evidence was received of production at present of such cloths.

(2) The quality of the best cloths now being produced is lower than is desirable for the requirements of a substantial section of the community, having regard to the facts that—

(i) they do not give the wear contemplated by the Rationing Commission when fixing the clothing ration scale; and

(ii) their use involves waste of labour for making up and limited supplies of linings and trimmings.

Question (d)—What measures are necessary and desirable to maintain or improve the quality of wool piecegoods produced in Australia—

(1) by permitting the manufacture of cloths higher in quality than the maximum quality prescribed in the Control of Woollens Order.

(1) A small surplus now exists of manufacturing capacity over the combined needs of the services and the rationed clothing requirements of civilians.

(2) Part of this surplus must be devoted to the manufacture of woollen cloths to replace scarce cotton and other cloths, and another part to filling of such export orders as may be approved by the Government.

(3) The Controller of Woollens should, at his discretion, direct the use of the

existing surplus manufacturing capacity for civilian needs, and also any such surplus that may occur from time to time in the future to improvements in quality in preference to the building up of stocks of piecegoods of current quality.

(4) Any improvement that can be made in quality by utilizing surplus capacity and/or by reducing production where this can be done should be spread over the greatest quantity of cloth rather than be concentrated on the production of a small quantity of high grade cloth.

(5) In any action on the foregoing lines, the Controller of Woollens should have regard to the following:—

(*a*) The requirements of the Rationing authorities;

(*b*) The fixing, by the Prices Commissioner in accordance with his usual practice, of maximum prices for improved cloths, prices so fixed, if higher than those now ruling, will not constitute a breach of the Prices Stabilization policy;

(*c*) The fact that the man-power available to the industry in the near future will not exceed the numbers employed in November 1943, and may even be less.

(2) **By improving the quality of the cloths now produced which are below that standard.**

No measures are necessary or desirable to improve qualities by this means.

(3) **Or otherwise.**

Opinions were expressed by witnesses in favour of legislation to enforce the branding of fabrics in such a way as to indicate their quality and the materials from which they are made. Since such proposals are already under consideration by appropriate governmental authorities, the Board did not further examine them.

War-time Changes in the Industry

Prior to the war, the Australian Tariff Board conducted several inquiries into the woollen textile industry in connection with the question of duties under the Customs Tariff. The most recent of these inquiries was held in 1937 and covered wool tops, yarns, piecegoods and blankets. In 1941-42 the Board made a survey of the Woollen Textile Industry on behalf of the Minister for War Organization of Industry.

With the outbreak of war, enormous demands fell on the industry to supply the needs of Australian and Allied Services in Australia and overseas. The industry was, in due course, placed under the control of the Department of Supply and Development, and supplies for civilians were heavily curtailed. Close co-operation between the department and the industry resulted in a great increase of production by means of:—

(*a*) Installation of new plant;

(*b*) More continuous operation of plant;

(*c*) Standardization of yarns and weaves for Defence fabrics;

(*d*) Introduction and extension of shift work, and/or overtime.

By the end of 1941, production had been increased and the Department of Supply and Development estimated that, after Service demands had been met in 1942, there would be available for civil needs:—

Worsted yarn	9,037,000 lbs.
Woollen „	4,405,000 „
Total ..	13,442,000 lbs.

compared with 31,621,000 lbs. used before the war.

Mr. R. J. Vicars, now Controller of Woollens, Department of Supply and Shipping, and then Textile Adviser to the same Department (then known as the Department of Supply and Development), informed the Board that early in 1942, the production for civil use was only 184,000 lin. yds. of cloth, including blankets, per week, compared with purchases at the rate of 440,000 lin. yds. before the war. He also estimated that, early in 1942, 560,000 lin. yds. a week were being purchased by civilians with consequent heavy depletion of stocks. Further, yarn production for machine knitting had fallen to an average of 52,000 lbs. weekly against a pre-war usage of 116,000 lbs.

Consultations between Commonwealth Departments and the industry led, on 1st April, 1942, to the publication of the Control of Woven Woollen Materials (Civil Needs) Order. This Order empowered the Minister for Trade and Customs to determine the types and the quantities of each class of woollen goods that should be produced, and to direct the distribution of such goods; the control of manufacture was vested in the Minister for Supply and Development. On 24th May 1943, the Minister for Trade and Customs delegated his powers of determining types and quantities to be produced to the Controller of Woollens, who was already, on behalf of the Department of Supply and Development, controlling manufacture. On 28th June 1943, those clauses of the Order conferring on the Minister for Trade and Customs the power of controlling distribution were repealed, as also was a clause empowering the prohibition of the use of trade marks or brands on woollen materials. Though in existence for over a year this last mentioned power had never been exercised.

Immediately on the issue of the Control of Woven Woollen Materials (Civil Needs) Order, the Controller of Woollens took steps to increase the quantity of cloth produced for civil use. Up to that time, the standardization of yarns and weaves had been applied with great effect, but only to Defence cloths. It was considered inadvisable to apply the same measure to civil production, since, because the equipment of mills differed, it would be likely to result in reducing rather than increasing production. The Controller, however, sought the co-operation of manufacturers to eliminate all types of construction that would hinder production. The use of more than one colour in the weft and of elaborate patterning was banned, and mills were required to concentrate on long runs, instead of producing small quantities as was done pre-war in order to supply demand for variety. In general, however, mills were allowed to continue the production of cloths as similar in nature as possible to those normally produced because in that way, maximum quantity could be made.

The extreme shortage of yarn described above, led to the banning of "two-fold weft" yarn in the manufacture of worsted cloths since, according to the Controller of Woollens, tests showed that the production of two-fold yarn required two and half times the man-hours used in the manufacture of an equivalent quantity of "single fold" weft yarn.

The range of materials and qualities which mills were permitted to produce was based on a schedule which was submitted to Production Executive but which, however, was never made the subject of a statutory order. Thus manufacturers were required by the Controller of Woollens to manufacture to prices which precluded the production of the most expensive grades in each variety. Subsequently, Prices Regulation Order No. 1150 of 3rd August 1943, prescribed the maximum prices to be charged for various classes of cloths.

At the time of the introduction of clothes rationing (mid-1942), it was found that the production of cloths for civil use, excluding blankets, had risen to 252,000 lin. yds. a week, whereas the estimated quantity needed to meet coupons was 340,000 lin. yds. excluding blankets. Similarly, though machine knitting yarn production had been increased from 52,000 to 60,000 lbs. a week, coupon requirements of garments were expected to amount to about 120,000 lbs. Shortages remained acute through the winter of 1943, but from July of that year the demand of the Services began to slacken, partly because of the movement of troops to the tropics. In August 1943, production of cloth for civilians increased to 493,000 lin. yds. a week against estimated rationing requirements of 340,000 lin. yds.

Manufacturers were then informed by the Controller of Woollens that some slight relaxation could be made in types and patterns, provided discretion was exercised. Shortly afterwards the Controller of Woollens made a proposal to the Director of Clothing and Textiles that mills should be permitted to produce for civilian use better grade cloths to the extent of one-sixth of the total output. Considerable discussion on the proposal ensued and the matter was ultimately referred to the Tariff Board by direction of Production Executive.

According to recent estimates made by the Rationing Commission, the present position regarding production and demand is as under:—

	Million sq. yards per annum
Pre-war consumption of cloths.	30.6
Present estimated rationing requirements	27.8
Approximate rate of production	33

The witness representing the Rationing Commission said that no great exactness can be claimed for the estimate of rationing requirements, particularly when an attempt is made to divide the total into different classes of cloth. If that estimate be accepted, a margin of about 5 million square yards is shown. Production of worsted cloths is, however, not in excess of requirements, and stocks have fallen to a dangerously low level. Some 3 million square yards of the margin is taken up by manufacturing cloths to replace cotton cloths now in very short supply, and orders for export have been accepted, or are under consideration, that could heavily exceed the residual capacity. The witness representing the Man-power Directorate expressed the opinion that it might sometimes be advantageous to export woollen cloths in exchange for cotton cloths that are in even shorter supply.

New Shrinkproof, Mothproof Woollen Fabric

RECENT developments of shrinkproof, mothproof woollen fabric would mean a big improvement in civilian clothing in the post-war period, the Chairman of the Australian Wool Board (Mr. D. T. Boyd) said. He added that at present the services were getting the principal benefit of the improved fabric.

This development follows the discovery by a European chemist who noticed that green materials never became moth eaten. He traced this to a certain dye which was being used in the production of green colour. Considerable research has resulted in several colourless products which can impart mothproof properties to wool. These products are simply added to the dyeing bath.

Astonishing changes are forecast in types of fabrics for the post-war world—materials of completely new appearance and holding new combinations of qualities. One Bradford authority tells of a wool material which will be neither worsted nor woollen but somewhere between the two. Woollen sheets, practically indistinguishable from cotton or linen except for additional warmth, will be available. Woollen materials to which sheen has been imparted will rival the finest silks and satins.

Health Insurance For Industrial Workers

Scheme Placed Before the Government of India

FOR the first time in the history of Indian labour a scheme of health insurance for industrial workers has been placed before the public and the Government. The scheme has been prepared by Prof. B. P. Adarkar, officer on special duty in the Labour Department and member, Labour Investigation Committee, Government of India. It will cost Rs. 2½ crores a year and is intended to provide security of income during sickness and cure and prevention of disease.

The Royal Commission on Labour had strongly emphasized the need for a scheme for providing medical care and income security during sickness to industrial workers. Prof. Adarkar was appointed to prepare the scheme in pursuance of the decisions of a series of Ministerial Labour Conferences and the Tripartite Labour Conference. The author was assisted in his task by a Panel of Advisers representing employers' and workers' associations and consisting of Sir Shri Ram, Mr. Kasturbhai Lalbhai, Mr. J. C. Lancashire, Mr. J. M. Garrie, Mr. A. H. Bishop, Mr. S. C. Joshi, Mr. S. S. Mirajkar, Mr. V. M. Tarkunde and Mr. G. Lobo. He was also assisted by an Actuarial Advisory Committee consisting of Mr. L. S. Vaidyanathan (*Chairman*), Mr. S. N. Vaidya, and Mr. B. K. Shah.

The scheme is both compulsory and contributory and applies, in the first instance, to three groups of factory industries, namely, textiles, engineering and minerals and metals—covering nearly 60 per cent. of factory workers or about 12 lakhs of workers out of a total of some 20 lakhs. In due course, it will be extended to other industries. There will be some "scheduled exceptions" where the scheme will not apply.

The employers' contribution will be Re. 1-4 per month per worker, while the workers' contribution will be respectively As. 12, As. 8, and As. 4, according as the worker belongs to the category of permanent, temporary or casual. Although in pursuance of earlier decisions of Labour Conferences and Governments, the contribution is bipartite, Prof. Adarkar has strongly urged Government participation in the scheme and made an alternative recommendation that the State in India should contribute As. 8 per worker, of which the Government of India should contribute As. 2 and Provincial Governments As. 6. Correspondingly, he has suggested a relief of As. 6 for employers and As. 2 for workers in each category.

The total cost to Governments, if they contribute, will be about Rs. 72 lakhs a year (on the basis of 12 lakhs of workers), of which the Central Government will will have to pay Rs. 18 lakhs per annum, while provinces will have to pay the balance of Rs. 54 lakhs on a *pro rata* basis, according to the number of insured workers. The total budget of the scheme is expected to be about Rs. 252 lakhs per annum.

The employer will collect his own and the workers' contribution, and for this purpose the "stamped card system" prevalent in other countries will be adopted. As regards benefits, medical benefit, including free medical attendance and treatment, almost without limit, will be given. Cash benefit will be subject to certain conditions regarding "qualifying" and "waiting" periods. Additional benefits will be available at a later stage when the scheme is stabilized.

Administrative Machinery

The administrative machinery will consist of a statutory corporation, with a central board, a number of regional-provincial boards, and a network of local committees in industrial centres, with functions appropriate to each body.

The medical organization will be based mainly on the principle of a salaried medical service, although the panel system will prevail in certain limited number of cases. It is recommended that the medical organization should be largely independent so as to meet the special requirements of industrial workers and that to prevent laxity in certification there should be medical supervision and sick visitation. To deal with disputes and offences, judicial machinery has also been proposed in the report.

The report recommends that, in view of the comparative failure of the Maternity

Benefit Acts and of the Workmen's Compensation Act, and also in view of their great financial bearing upon health insurance, maternity benefit should be provided on an insurance basis in conjunction with health insurance, and the Workmen's Compensation Act should be scrapped and replaced by a scheme of insurance against industrial disability.

Prof. Adarkar, observes: "Health insurance is traditionally as well as organically the most important measure of social insurance. It attacks the twin giants of want and disease from amongst the five giants mentioned by Sir William Beveridge in his monumental report (the other three giants being ignorance, squalor and idleness). In India, where all these giants flourish unabatedly, the beginnings of social insurance date from the passing of the Workmen's Compensation Act and the various Maternity Benefit Acts, but both these measures fall short of the true ideal of social insurance. Of all the occupational and social risks covered by social insurance, that of sickness undoubtedly possesses the greatest social interest. And yet, in India, unfortunately, the proposal of health insurance has had a long and somewhat chequered history."

Government's Attitude

It is pointed out that the Government of India have not yet considered the report and are not committed to all the views expressed by Prof. Adarkar. They, however, are inclined to accept the opinion that sickness insurance should not be considered in isolation.

On this point Prof. Adarkar in his report observes that four assumptions are implicit in the successful adoption of a scheme of health insurance. These are (1) the early adoption of a scheme of unemployment insurance and the creation of new employment in the post-war period through a drive for national planning and development; (2) the establishment of a scheme of old age pensions; (3) the adoption and enforcement of certain "premedical" measures such as regulation of wages, rigorous enforcement of factory laws, housing, nutrition, education in health, and improvement of environmental hygiene, and (4) a national health drive. These measures, says Prof. Adarkar, are necessary to keep down the incidence of sickness to the minimum possible and to prevent the scheme from being saddled with burdens legitimately belonging to other aspects of social security.

One of his recommendations is that the position of foreign workers working in India will be subject to special rules, implying reciprocity and retaliation. Prof. Adarkar explained that Indians were excluded from similar schemes in certain countries and what he proposed was that foreign workers should be similarly excluded from the benefits of the Indian scheme too. The idea, he made it clear, was more one of reciprocity than of retaliation.

Public Regulation of Industries

Suggestion of the British Trade Union Congress

A call for the immediate transfer to public ownership of transport, fuel and power, and iron and steel industries is made in the British Trade Union Congress report on post-war reconstruction, issued recently.

The report says that public control is necessary in different ways and in varying degrees over the whole of the economic life.

"A large number of important industries immediately require some form of direct public regulation. In general this should be secured by setting up Industrial Boards in these industries, composed of representatives of workpeople and employers in equal proportion, and an impartial chairman and other independent members, appointed and paid by Government," says the report.

Industries for which some form of public regulation was necessary included cotton and woollen textiles, heavy chemicals, cement, rayon, soap and margarine non-ferrous metals, rubber processing, grain milling and tobacco ; mechanical, and electrical engineering, motor car manufacture, aircraft, railway locomotives and rolling stock and ship-building. There should continue to be Government control over the movement of capital in and out of the country, operations of the Bank of England and the lending policy of joint stocks banks.

To secure comprehensive planning of all forms of investment in accordance with national and social needs, a National Investment Board should be established with a surveying, planning and lending department, the report urges.

Foreign Trade in Fifth Year of War

Trends in 1943-44 Analysed

INDIA'S foreign trade showed a distinct improvement in 1943-44, the fifth financial year of war, over the preceding year during which our foreign trade had reached its lowest ebb since the outbreak of war. The outstanding features of the year were an increase in the total foreign trade of the country; increased favourable balance of trade; increase in trade with non-Empire countries; decline in the exports and increase in the imports of grains, pulses and flour; decline in the relative importance of manufactured articles as compared with raw materials and articles partly or wholly unmanufactured in the import trade; and slight increase in the relative importance of manufactured articles over raw materials and articles partly or wholly unmanufactured in the export trade.

Increase in Total Trade

The total foreign trade of British India increased from Rs. 305 crores in 1942-43 to Rs. 329 crores in 1943-44, an increase of Rs. 24 crores as compared with 1942-43 and of Rs. 8 crores as compared with 1938-39. It may be noted, however, that these statistics do not include either the value of imports and exports on Defence account, or the value of transactions under Lease-Lend, and, therefore, do not account for the entire volume of goods imported into or exported from the country. The volume of trade covered by the excluded items may, however, be presumed to have increased considerably during the year under review.

The total exports of Indian merchandise on private account from British India expanded to Rs. 199.2 crores in 1943-44 as compared with Rs. 187.6 crores in 1942-43, being an increase of 6 per cent. over last year, while the total imports of foreign merchandise into British India increased by Rs. 8.4 crores or 8 per cent. from Rs. 110.4 crores in 1942-43 to Rs. 118.8 crores during the year under review. The balance of trade in merchandise (private) of British India continued to be favourable to India. In 1943-44 it was favourable to the extent of Rs. 91.4 crores as against a favourable balance of Rs. 84.4 crores in 1942-43, and of Rs. 17.4 crores in the pre-war year, 1938-39.

Import Trend Analysed : Food Articles

Imports under Group I, viz., "Food, drink and tobacco," which had declined to the extent of about Rs. 20 crores during 1942-43, due mainly to the cessation of imports of rice from Burma, increased from Rs. 7,62 lakhs in that year to Rs. 8,13 lakhs in 1943-44. This increase was, however, not large enough to effect any significant change in the relative importance of this group, which continued to be about 7 per cent. of the total imports into British India. Attention may, however, be drawn to one item in this group, viz., "Grain, pulse and flour" whose imports increased by Rs. 1,17 lakhs from Rs. 31 lakhs in 1942-43 to Rs. 1,48 lakhs in 1943-44.

Increase in Raw Materials Imports

Imports under Group II, viz., "Raw materials and produce and articles mainly unmanufactured," also increased by Rs. 11,98 lakhs to Rs. 63,94 lakhs in 1943-44. It will be recalled that until 1941-42 the value of raw material imports was less than that of imports of manufactured articles but in 1942-43 the position was reversed. In that year, raw material imports constituted nearly 50 per cent. of the total imports as against 29 per cent. in 1941-42. This tendency was further developed in 1943-44, when the value of imports under Group II increased to Rs. 63,94 lakhs from Rs. 51,96 lakhs in 1942-43 and constituted 54 per cent. of total imports as against 47 per cent. in the previous year. The item in this group whose imports increased during the year as compared to the previous year were oils (vegetable, mineral and animal) whose imports increased from Rs. 27,79 lakhs to Rs. 36,33 lakhs; cotton (raw and waste) whose imports increased from Rs. 15,42 lakhs to Rs. 17,53 lakhs; raw wool whose imports increased from Rs. 2,95 lakhs to Rs. 4,02 lakhs and non-metallic mining and quarry products other than coal whose imports increased from Rs. 1,89 lakhs to Rs. 3,31 lakhs. An important item whose imports decreased in 1943-44 was "seeds," the fall in imports amounting to Rs. 1,04 lakhs from Rs. 2,27 lakhs in 1942-43 to Rs. 1,23 lakhs during the year.

Decline in Imports of Manufactures

The value of imports under Group III, viz., "Articles wholly or mainly manufactured," particularly in respect of the more important articles in this group, further declined in 1943-44. The total value of imports under this group decreased from Rs. 49,51 lakhs in 1942-43 or 45 per cent. of total imports into India during the year, to Rs. 45,11 lakhs in 1943-44 or 38 per cent. of the total imports. The items which showed the most significant declines were "Vehicles" from Rs. 5,71 lakhs to Rs. 1,27 lakhs; "Metals" (including iron and steel) from Rs. 6,13 lakhs to Rs. 4,13 lakhs; and "Paper, paste board and stationery" from Rs. 2,16 lakhs to Rs. 1,97 lakhs. Certain other items showed an increase, e.g., "Dyes and colours" from Rs. 5,43 lakhs to Rs. 8,38 lakhs; "Chemicals, drugs and medicines" from Rs. 6,38 lakhs to Rs. 7,26 lakhs; and "Machinery" from Rs. 10,53 lakhs to Rs. 11,39 lakhs.

Exports of Raw Materials Also Increased

Exports under Group II, viz., "Raw materials and produce and articles mainly unmanufactured" also increased from Rs. 42,76 lakhs in 1942-43 to Rs. 44,64 lakhs in 1943-44, i.e., by Rs. 1,88 lakhs, whereas they had declined in 1942-43 by about Rs. 22 crores. In this group, the principal increases in exports were recorded under the following heads: cotton (raw) from Rs. 5,31 lakhs in 1942-43 to Rs. 7,49 lakhs in 1943-44; raw hides and skins from Rs. 3,38 lakhs to Rs. 4,12 lakhs; and seeds from Rs. 10,52 lakhs to Rs. 11,16 lakhs. On the other hand, exports of raw jute were reduced from Rs. 9,02 lakhs in 1942-43 to

Rs. 8,32 lakhs in 1943-44, and those of oils and oilcakes from Rs. 1,98 lakhs to Rs. 98 lakhs.

Increase in the Value of Manufactures Exported

The increase in the value of exports under Group III from Rs. 95,37 lakhs in 1942-43 to Rs. 104,60 lakhs in 1943-44, i.e., by Rs. 9,23 lakhs is significant as this group consists mainly of manufactured articles and indicates the growing dependence since the outbreak of war of certain countries on India for their requirements of such commodities. While the exports of certain articles like jute manufactures, woollen manufactures, chemicals, machinery, rubber manufactures, and metals other than iron and steel, increased, a few important items suffered a reduction, for instance, cotton yarns and manufactures from Rs. 46,19 lakhs in 1942-43 to Rs. 42,48 lakhs in 1943-44; hides and skins from Rs. 4,76 lakhs to Rs. 4,37 lakhs and iron and steel from Rs. 1,45 lakhs to Rs. 1,05 lakhs. Another feature of the export trade during the year was that the relative importance of the main groups underwent little change except that the share of Group III consisting of manufactured articles in the total exports showed a slight increase.

Foreign Countries Increase Their Share

As regards the direction of trade, while the share of the Empire countries in the import trade of British India in 1943-44 declined by Rs. 4,24 lakhs as compared with the preceding year, that of foreign countries increased by Rs. 12,65 lakhs. On the export side also non-Empire countries took a greater share of the increase in India's exports. There was a substantial increase in imports from Australia, but Canada's share in the import trade was reduced from Rs. 5,53 lakhs in 1942-43 to Rs. 2,52 lakhs in 1943-44. The increase in imports from non-Empire countries was mainly due to higher receipts from Iran, Iraq and Egypt. On the export side, the United States, whose share increased by Rs. 12,49 lakhs over the previous year, largely accounted for the increased offtake by non-Empire countries, while amongst the Empire countries the largest increase was recorded in the exports to the United Kingdom, which were higher by Rs. 2,87 lakhs than in the previous year.

British Cotton Industry

Government's Plans to Meet World Competition

THE British Government's plans for directing the re-establishment of the cotton industry to meet world competition after the war are announced. To avoid the danger of continuation of the pre-war shrinkage of output, exports and employment—" which would be a disaster to Lancashire and Britain"—the Government urges the industry to take immediate steps to put the following five-point programme into operation :—

(1) To bring about such amalgamations, particularly in the spinning section, as are required to secure efficient and financially strong units. (2) To undertake the necessary re-equipment so that in respect of machinery, buildings and amenities the industry will be second to none. (3) To overhaul the merchanting organization particularly with a view to enabling the producing sections to achieve great economies of continuous runs and bulk production. (4) To modify and simplify the wage structure of the industry. (5) To extend double-shift working without which the expense of installing modern machinery in many cases would not be justified.

" Unless the industry will face these questions in a bold and practical spirit there can be no satisfactory guarantee of stable prices, production or employment," said Mr. Hugh Dalton, President of the Board of Trade. The Government reject the plea urged by all sections of the industry for a system of statutory minimum prices. They say that there are grave dangers in such arrangements which might easily lead to restriction rather than expansion of output and to a perpetuation of the inefficient and old-fashioned methods by some firms.

In the home market, the problems would be to enforce not minimum but maximum prices so as to prevent inflation, and in overseas markets the need would be for discretion on the part of exporters; control must continue for a considerable time after the war, and when it disappeared the Cotton Industry (Reorganization) Act of 1939 would come into operation.

Disclosing the proposals to the Cotton Board Post-war Problems Committee, Mr. Dalton told the members he hoped the whole industry would lose no time in putting them into effect. After the meeting, he said he had informed the meeting that the Cotton Board would continue its work on its present lines after the war until under the 1939 Act a new Board with extended powers would be set up.

Commenting on the Government's proposals, Sir Raymond Streat, Chairman of the Cotton Board, said he was sure they would be the subject of a very hot debate in the industry.

Cotton Spinning 9

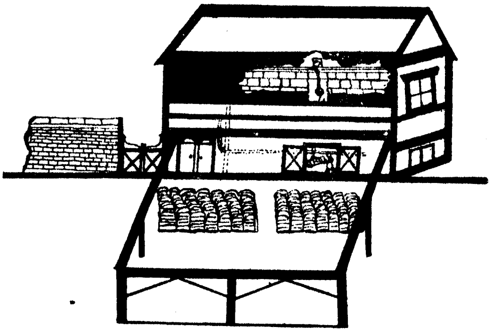
Arrival of Cotton at the Mill

By JAMES H. DAWSON, F.T.I.

(All Rights Reserved)

THE arrival of the cotton at the mill and its reception *there* is of itself a much more important event than may appear to many observers.

The *inside management* of the mill starts when the bales arrive there. Such bales will come from the rail depot or other receiving terminus ; and upon arrival at the mill, they are very often indiscriminately pitched off the trucks or lorries on to the ground in front of the cotton-godown or warehouse. In many cases such bales are allowed to remain outside in the open-air for a much longer period than is good practice. In rainy weather they get soaking wet, and in the very hot weather they get " bone dry." This is a very bad system and should be avoided. If the cotton godown is built with a projecting wood cover-like or shed top arrangement, under which a few truck loads of bales may lie comfortably sheltered until they could be removed to the godown the aforementioned evil is overcome. The cotton godown should be provided with a travelling crane, which from a "cat-head" projecting into the mill yard could pick-up the bales from the lorry or from the outside ground, run them into the godown, and traverse all round it, so that the bales may be placed in position wherever it is desired to stock them. It is customary that every bale should be weighed and ticketed before leaving the sellers' warehouse. The tickets must notify the " mark " of the cotton, the " consecutive number," the weight of the bale, and the number of bands or garth irons. These particulars are then included in the invoicing particulars and every bale may then be weighed separately as it is being " hoisted in," and the bands counted in order to " tick off " the delivery note and the invoice, a convenient platform scale being provided. Afterwards as the bales are removed from the godown and taken in to the mixing loom for use, the tickets are taken from the bales and filed, until the end of the days' work, when they can be taken into the office, where the " numbers " of the bales mixed are "ticked off" in the office book kept for that purpose, wherein the numbers of the bales, their respective weights, and numbers of bands have been entered (copied from the advice notes received in advance from the cotton broker). By these and similar means a check is kept upon all cotton received and warehoused. When afterwards the bales are mixed in a stack mixing or (in cases where stack mixings are not made) when each bale is opened and laid alongside the bale breaking machine, the abovementioned tickets are taken off the tare or wrapping and filed, ready for transference into the office at the end of the day's work.



We have already mentioned the advisability of the use of a " trolly crane " with a " cat-head " extending outside the cotton godown. The use of this, to facilitate the unloading of the bales and their removal into the godown is invaluable. The employment of mechanical labour in connection with this department, however, should not end as soon as the bales are under cover.

The godown should be built as high as reasonably possible, bearing in mind the number of bales it is expected to house. Fixed to the roof girders inside, in the correct position for carrying a set of travelling pulley blocks, should be a line of steel rails completely encircling the building. As the bales are "landed" inside the godown, they can be packed up easily, carried by the travelling pulley block, and conveyed to the desired position for the stack of that particular "mark." In this manner the bales can be "stacked" wherever required ; the height of the stack is controlled only by the underside of the roof girders. The return in the labour-saving and convenience of this system is well worth the little extra expense incurred in the first cost of the building. Further, advantage can be taken of this system when the blowing room is situated in close proximity to the cotton godown. In many instances known to the writer, the cotton godown is separated from the blowing room by a brick wall only, and there is a suitably sized door leading from one to the other. Labour-saving is again introduced by means of a pair of blocks and pulleys, and a rail which reaches from end to end of the godown, fixed upon the pillars down the length of the room. This rail enters the doorway of the blowing room, passing along to the side of the bale-breaking machine. To pick up a bale from the floor near the stack, to carry it along and to lay it alongside the bale breaker is a matter of a few minutes only for one man. It is usual in this case to sample the bales whilst upon the truck, previous to running them out of the bale storeroom; by breaking one or two bands off, and drawing a sample from the middle of the bale, a sample also from the top and bottom sides of the bale are also usually taken.

When a stack mixing is made, the sampling is done as the bale is opened near the stack and the top and bottom sides, as well as the "inside," can be easily examined. The question of feeding direct from the bales supplied to the bale breaker, as above explained, or feeding from a "stack" which is first built up from a given number of bales is a question of choice, each system having its supporters.

Having now got our cotton into the godown, we follow on to the first of the inside processes. We must *mix* the cotton from the various bales in order to obtain the best results. When the bales are transferred from the cotton godown for the mixing operation it will not suffice that we should commence and bring bale after bale into the cotton chamber or mixing room and have them mixed without guidance or system. All the bales should be sampled first if possible. Suppose we intend making a "stack mixing." A stack mixing is where the cotton is piled up into a stack, layer upon layer, and well-trodden down. If the space available for our stack is capable of receiving, say, 50 bales, then the 50 bales intended for such use should be examined by sampling both sides. This can be done by cutting a slit in the wrapper and withdrawing a good handful of cotton therefrom. Even if the 50 bales are all one "mark" they will vary more or less in the qualities previously described.

Some years ago the system was to truck the bales from the godown, and lay them down in position for sampling conveniently near where the stack was to be made. Layer after layer was stripped from the bulk of each bale, and pulled into pieces (always supposedly small, but often not small enough for the carding master's satisfaction).

When the cotton had to be used it was torn away from the bulk, or stack and passed on to the next process.

The Opening Machines

In many cases these machines were some distance away from the mixing room and the cotton had to be conveyed to the openers by manual labour. Systems of mechanical conveyance are now in general use, and the mixing of cottons in these days is quite a different proposition compared with what it was some time ago. Nowadays it is necessary to have some idea of the uses of "beaters" and "fans" before we get to the blowing room stage proper, in order to follow the mixing room processes. We have just hinted that it is nowadays necessary to have a good knowledge of beaters and fans in order to be able to follow the mixing room processes. It is quite as necessary that we should understand *that there is a necessity of "mixing,"* otherwise the modern process which involves the necessity of knowledge of beaters and fans would stultify the advantages of the process. Certainly cotton mixing has become revolutionized, owing to the introduction and aid of mechanical means. It is in the mixing room where the key to the whole situation of a successful cotton spinning concern lies. This does not mean that the only thing that matters is to reduce the cost of the mixing, although this is often erroneously quoted as being one of the principal objects of mixing. Certainly it is one of the objects in specified cases. We would venture the suggestion that the principal object of " cotton mixing " at the mill is to remove as far as possible the *damage done* by the mixing of cotton before the spinner gets it. If the cotton was not so well mixed when it arrives at the warehouses in Liverpool, Manchester, and other cotton receiving centres, there would be less necessity for mixing it well in the mills of Oldham and Rochdale and other cotton spinning centres.

In previous instalments the writer has pointed out how it is impossible to grow cotton fibres *anywhere* which are regular in length of staple. How even upon the same individual seed the staple lengths and their diameters vary considerably. The differences in the length and thickness of fibres, however, are only two of the variations found in the cotton when *baled.* We get differences in the cleanliness, and even in the nature or composition of the " foreign matter " which is responsible for the uncleanliness. We get differences in the shade, and the shades vary so much in many instances that we may refer to differences in colour. We get " spotted cotton," and " stained cotton," and different colours of spots and stains ; some stains are oily from crushed seeds, others are caused by chemical reaction owing to the use of fertilizers. Some are caused by spraying the plants to kill off boll-weevil or any similar pest; while others are caused by excessive rainfall, when the bolls are open. Some cotton, which is supposed to be white, may vary from a creamy or natural colour to " blue," which is a type of white inclined to look " bluish." The blue may be likened to an overbleached white, when too much blue has been used in the liquor. What is known as a natural colour should be a nice very light cream. Between these two extremes we have all the variations between good " bloom " or " blush " to dead or dull white.

The creamy cotton with plenty of bloom is apt to " run-off " until we get what is known as " buttery " cotton, which sometimes assumes a light brown colour; this would then be described as " tinted." Even if colour, cleanliness, and length of staple were satisfactory, we could have other variations.

Curly cotton, or stringy cotton, caused in the ginning process, may be present in some bales, more than in others ; as also may " *gin-cut* " cotton, which is caused in many cases by the same defects in the gin, the difference being that the gin-cut cotton was ginned when *dry,* and the stringy cotton was ginned when *damp* or *even wet,* and in that condition the effect of overloading the gin, bad setting of the saws, and gin breast, would be to roll up the fibres into a " stringy " mass, rather than to " cut " them or break them. With the stringy cotton, therefore, we may expect damp cotton. Two other extremes are " *green cotton* " and " *mossy cotton.*"

Mossy cotton is caused principally by the presence therein of an excessive proportion of short and immature fibres ; such as may easily accrue from the seeds being stripped too bare in ginning, or adulteration by an admixture of linters.

Green cotton may, on the other hand, be all right in staple quality, but may lack the mellowing influence of age.

New crop cottons, " first pickings," are in this category. It is not suggested that all these faults in cottons come in every consignment, but there are numerous combinations of circumstances which make almost anything possible.

First of all, there is the fact that some plantations cover a very large area. Some of the land upon the foothills, or the rising ground, is, therefore, well drained ; other parts of the estate may lie in the " bottoms " near the river. There would be a vast difference in the product of such lands even from the same class of seed. The crop gathered therefrom would all be ginned and baled together ; just as all the sheaves of wheat, or oats, from one farm would be " thrashed," and the resultant grain bagged up together. This happens on large estates, where they have their own ginnery and compress plants. In other instances a group of smaller planters will have to co-operate in the use of one ginning plant and compress. The possible mixing of different growths in these cases is obvious. As the seed cotton is being brought in day by day, the ginners will be constantly moving it out again, seed and lint separated. These people do not consider the *cotton* from the spinner's point of view. Their chief concerns are, first, the yield of seed cotton per acre of land planted; secondly, the weight of lint per ton of seed picked and ginned. There are also other people who do not consider the spinner. These are the "growers" of the "*city-crop*"; the dealers in "*specks*" and those who handle "*no mark*" cotton.

The "city crop" is made up of the old samples, "redraws" and pickings or sweepings from the floors in the warehouses, sale-rooms, etc. "Specks" are lots of cotton purchased with a view to resale. "No-mark" cotton is comprised of bales from which the original markings have been obliterated or labels of transport marks missing. In all these cases there are dangers that some of these bales may get among other lots and made to look like them outwardly.

It will be seen that one of the principal objects of mixing cotton at the mill must be to get as good an average as possible from the consignment which has to be dealt with. There are always variations more or less in lots of cottons and it will not suffice that we commence to use a lot of cotton and run it into work, passing it through the machinery, bale after bale. Hence we *must* mix, and the "stack mixing" must be properly made, *and afterwards properly used*, in the surest manner possible. We must explain "properly used." We should explain *first*, however, the building of a stack mixing of cotton; because the correct building of the same makes it more difficult to use it correctly.

First, a number of bales are opened, comprised of a definite number from each "mark" or lot which are to form the bulk. There may be 6 or 8 men to make the mixing. A couple of these men, will "throw on"; that is, they will take a layer from each bale, and throw same upon the space where the stack has to rise. The half dozen men will take up the layers and pull them into suitable sizes, pieces, and spread them around. As the layers increase in number, the stack commences to take shape, and the bulk of cotton rises in height. The six men on top, of course, are tramping about and around the rising stack until the arranged-for number of bales have been included. It can be understood that with all the pressure in building the stack it will be fairly solid. *That is the trouble.* When the stack has to be put into use the "*real mixing*" should commence. The one who has the job or duty of "feeding" from the stack, should pull the cotton from same, in a perpendicular fashion from top to bottom; in that way he gets cotton from every layer, and thus from every "mark."

However, to pull cotton in that fashion is hard work; and so, it often happens that it is removed, a portion of a layer after portion of layer, and fed thus into the machine, and to a certain extent, the object of mixing is by-passed. A similar negative result is obtained when the more modern methods of mixing are employed, and when the bale breaker is used.

In this system a number of the bales which are to be mixed are placed around the "bale breaker" in the required proportion of each mark. The man in charge of the machine always has definite instructions to "feed" the "hopper" of the bale breaker with layer after layer of equal thickness from each and every bale laid around the space behind the machine, and in the correct routine to ensure a proper blending of the "sorts." This system will prove satisfactory and the cotton will be properly mixed, and the size of the bales will diminish gradually and equally. It is not unusual, however, to catch the man with some of the bales half used, some scarcely touched, whilst other bales have disappeared altogether. Of course, the principles contained in the two systems of mixing stand good for our purpose, the failure of the human element to obey instructions is another subject, which should come more under the title of mill management than of "cotton spinning."

Suggestions for Improvement in Efficiency and Production

BY D. RADHAKRISHNAN, B.SC., L.T.M. (Bang.), and B. R. RUKMAJI RAO

(Specially Contributed)

THERE are two distinct factors to which we must bestow attention if greater efficiency and production are desired. These two factors are: (1) The Machine factor, (2) the Human factor. Any careless and haphazard handling of either or both is sure to have disastrous repercussions on efficiency and discipline. An intelligent and appreciative handling of the human factor, especially, is needed to traverse the "Path of the golden mean," avoiding either too much slackness or too much harshness, both of which have a tremendous bearing on the question of control of mill labour. Times have changed and correspondingly labour mentality has changed. We must always have now in view the psychological aspect in dealing with the human factor. The supervising departmental staff should have a clear understanding of this, and should meet any situation dealing with labour with consummate tact, commonsense and discretion. Such an appreciation of the situation will avert many an unhappy incident fraught with undesirable consequences. Broadly speaking, the supervising staff should know the crucial moments of when to "cajole" and when to "command."

We shall first deal with the human factor, and then we shall consider the machine factor. Extraction of the maximum efficiency and production out of a machine depends on two main factors: (1) the condition of the machine tenter, operating the machine and (2) perfect condition of the machine.

Maintenance of the perfect condition of the machinery rests on the supervising staff and the jobbers and fitters, each of whom should carry out his portion of the work honestly, diligently and painstakingly. This question could be dealt with afterwards by an enumeration of the duties to be carried out by each individual right from the head of the department to the oilman.

Human Factor

This factor exhibits the greatest variation and in dealing with each labourer, the supervisor should have in view the peculiarities and idiosyncrasies of that individual. Every supervisor should study each labourer under him in order to get an insight into the mentality of that individual. Then alone is he in a position to handle the labourer in question quite tactfully and to the best advantage of the parties. It is only then that he can know when to cajole and when to command. It has been our experience (at any rate with local labour) that too much familiarity is detrimental to proper enforcement of authority. It is true to say that familiarity breeds contempt. It is best for the staff to keep aloof from labourers in so far as personal matters are concerned. A little bit of "reserve" is to be cultivated whilst dealing with them. But this reserve should never be associated with harshness. On the contrary, it should always be tempered with a sense of fairness and sympathy.

A *disciplined* and *contented* labour force is the secret of efficiency. Please note that it must be both "disciplined" and "contented." One without the other tends to do more harm than good. Discipline is essential for smooth running of the departments; contentment is essential for extracting the maximum efficiency out of the workman. Psychology has abundantly proved that a discontented (mentally as well as physically) labourer cannot even put forth 50 per cent. of his normal efficiency. We suggest below a few things for enforcement of discipline, and a few things which may inculcate in the minds of the labourer a sense of contentment.

(1) Late coming should never be tolerated. Time office must be very strict about this, irrespective of the number of people who are defaulters. On many occasions, when a large number of workers have come late, time office sends word to deparmental head whether to open the

gates or not. If the late coming is countenanced by the departmental head with a view to decreasing the number of machines stopped, it sets a bad example for the late comers who sense a sort of weakness on the part of the staff. This policy is that of "pound foolish and penny wise." A strict enforcement of penalty against late comers will have a deterrent effect and after one or two days, there will be few or no late comers at all. What we lose by way of production due to idle machinery will amply be made up by the perennial gain got by regular attendance.

(2) Absence without leave. As per the standing orders, no workman is permitted to absent himself without leave and if he remains absent for more than a week, is liable to be discharged without notice. But this is not being strictly enforced. There are several habitual defaulters and the sooner such people are removed, the better. In fact, even if such people are given all their dues and emoluments and sent away, the mill does not stand to lose at all, because the effect produced on the others will be salutary.

(3) No person shall take more than 40 days' leave in a year (15 days' privilege leave and 25 days' ordinary leave) unless under special circumstances. If he does go on leave for more than 40 days, then he shall not be eligible for the yearly increments, etc.

(1) Every labourer during the night shift must be given one cake or biscuit and one cup of good tea between 12 p.m. and 2 a.m. This will have a tremendous effect on the workers. Such a distribution of cake and tea will have great beneficial effect on the worker both from the physiological as well as the psychological points of view. It breaks the monotony and gives relief to the tired worker. A sort of gratitude and contentment steal into his heart and he will work with doubled vigour. Only a person who has personal knowledge of the horrors of night shift could really appreciate the good effects produced by the distribution of a cup of tea.

(2) Every workman who puts in 6 days' attendance during the night shift week should be paid one anna attendance bonus per day. Even one day's default makes him lose this benefit.

Maintenance of machinery in good order. Machines could easily be kept in tip top condition when every member of the staff attends to his duties properly.

(1) *Departmental Head.*—(*a*) Going round the department and issuing of any instructions to his immediate assistants. (*b*) General inspection of the condition of the machinery. (*c*) Inquiries, if any, regarding misbehaviour on the part of his men. (*d*) Strict enforcement of the rules as per standing orders in respect of leave and other questions. There shall not be any deviations in this enforcement from department to department. (*e*) Any undue interference by one departmental head in the routine affairs of another departmental head should be avoided as far as possible, as this tends to dislocate the routine of that department and slackness may result therefrom. Any shortcomings may be indicated in writing by one departmental head to another. The shortcomings should immediately be attended to by the junior staff of that department under direct instructions from their head.

(2) *Assistant Masters and Supervisors.*—(*a*) Carrying out the orders of their superiors. (*b*) They should be in their departments at least ten minutes before the commencement of work. (*c*) They should attend to the requirements of the jobbers and assistants, and give them instructions. (*d*) They should be almost always on the spot and have an eye on the quality and quantity of the production. (*e*) Have an eye on the upkeep of the machinery. (*f*) Attend to leave and other questions. (*g*) They must be given such liberty of action as to settle amicably all ordinary questions and not bother the head of the department. Only serious matters may be brought to the notice of the departmental head.

Distribution of work among the Supervising Jobbers.—Head Jobbers.—(*a*) To go round the department and note if all the jobbers, fitters and oilmen are come. (*b*) To supervise and help overhauling of machines. (*c*) To give proper work to the general cleaning gang. (*d*) To check and replace worn-out parts of machines. (*e*) To recommend leave, etc., to the general shift workers. (*f*) To look after the arrangements of the substitutes for jobbers or fitters, etc., on leave in the general shift. (*g*) General supervision of the department. (*h*) If the night-shift jobber goes on leave, to come to night shift for that week as per instructions from his superiors. (*i*) To note that he and the side jobbers will be held responsible for any lowering in efficiency or production.

Side Jobbers.—(*a*) Putting men on the machines. (*b*) Checking if machines are all right. (*c*) Whether supply from back process is adequate. If inadequate, to bring the same to the notice of the respective doffing jobbers. (*d*) To keep an eye on the oilmen whether they have properly oiled the machines. (*e*) If any repairs are needed, then to give instructions to the shift jobber. (*f*) To recommend leave, etc., to his men in his shift. (*g*) To supervise the work of doffing jobbers, oilmen and fitters. (*h*) To note he will be responsible for any lowering in efficiency or production.

Doffing Jobbers.—(*a*) To see to the attendance of the doffing boys. (*b*) To note the urgency of doffs in different counts and to arrange to supply the same as quickly as possible to the next process. (*c*) To help the machine tenters after each doffing. (*d*) Whilst doffing machines, to be present personally and to pay particular attention to the "colouring" of the doffs (each colour indicating a particular count) in order to avoid mixing of different counts. (*e*) To see that the department is kept clean by the sweepers and his boys.

Fitter.—(*a*) To attend to the repairs of machines under instructions of shift jobber. (*b*) To attend to idle spindles. (*c*) To effect changes of change wheels, etc., as per instructions. (*d*) To help the cleaning gang during gear cleaning and oiling of one frame daily.

Oilman.—(*a*) To see to oiling of machines properly twice a day as per times noted. (*b*) To attend to beltings.

We have detailed above some of the important factors which may go a long way in the establishment of good efficiency and production. Many of the observations made are the outcome of long experience.

Practical Points for Writers and Readers

MR. J. H. Yates, Weaving Master, Birla Cotton Mills, Delhi, writes :—

I have read several articles on picking, sley setting, shedding, etc., and am amused to find they are more or less copies of old text books, one of which I have with me, first published in 1894, with a few words altered here and there to make it read and sound a bit different, and destroying the principle. One article I read explained there was a bottom shaft, a boss fastened on it with a key, a picking plate bolted to the boss, a picking nose bolted to the picking plate, that this nose acts on a cone-shaped bowl revolving on a bush bolted to an upright shaft called the picking shaft, etc. My point is—why tell a line jobber all this when every power-loom weaver in India knows it? What a line jobber wants to know is—how to set these parts to obtain easy working, and maximum life with minimum wear and tear both on the loom parts and stores as well. Pick setting is a work of art, it carries its secrets and should be set both from a commercial and practical point of view. If wrongly set, both stores and coal bills can be affected. I would like to see writers give diagrams of pick-setting, also diagrams of how the shuttle will travel from box to box with such a setting, along with alternate settings, showing what effect they will have on the travel of the shuttle, also showing HOW and WHY such effect takes place. For instance, raising or lowering the picking bowl, showing its correct position, also how and why such position is arrived at, correct shape of picking nose too. This is what a line jobber wants to know, and not a variety of words which tend more to confuse, than help him. There are other items in picking and pick setting, more than what meets the average eye, but I have only mentioned a few. We must not forget the picking motion is always an expensive item to every manufacturer in many ways and should be carefully watched both from a stores point of view and other points as well, especially in fine yarns, high counts of reeds and picks; otherwise much cloth can be spoiled, waste increased, hence the manufacturers' loss, more work and less wages for the worker. Every different make of loom has its own peculiarities.

Good pick setting is the forerunner to good shuttle travelling.

Sley Setting

Another item is sley setting. Here we are given a variety of circles, arcs and lines drawn showing how to find the height of the sley. Now what can the average line jobber do with this lot? It only confuses him. Give him a new loom of a different maker he has not seen before, tell him to set the sley, show him how to draw the circles, etc., and where will he get to with it? What he does want is—a foolproof method, simple and easy to follow with any make of loom. In sley setting we have to watch how the shuttle enters the box, how it comes to rest in the box and how it leaves the box; otherwise we are labouring in vain and at a cost too. This cost is borne by the manufacturer in every way; besides weaver and line jobber suffer too. There are many things to see in sley setting which only a practical eye can detect, especially as in pick setting, in fine yarns, high reeds and picks, coarse counts can stand more strain as these are in low reeds and picks as a rule; for example, take a loom running, say, 20 or 30s warp in a 48 to 70 reed, with, say 20s or upto 40s weft, about 50 to 70 picks per inch, it will run easily and give no trouble in these low qualities. Now change over to 90s to 120s warp, 70s upto 140s weft, 90s to 120s reeds and 120 picks to the inch and see the difference in the running of the loom. What do we find? Perhaps weft breaking, weft catching in the box, leaving part picks in the cloth, weft marking in the box showing dark stains in the cloth, many warp threads breaking, especially at the selvedges in the higher picks, shuttles chipping or wood burning and wearing away rapidly, bad travelling, hence their effect on the weft and warp, all with the same sley setting. WHY? The writer has had this practical experience. To deal with coarse counts is an easy job, but to deal with fine yarns is a work of art. Fancy and art silk cloths have also to be considered for sley setting. I have just mentioned a few things at a glance; space does not permit me to go deeper. There is also the keenness of the shuttle on the reed and how to regulate it. This is more pronounced in the higher qualities of fine cloths and in certain makes of looms, more than others. One particular make of loom known to the writer is faulty for this but can be easily overcome. What the line jobber wants to know is a foolproof method in dealing quickly with all these matters, how to obtain a keen eye for defects. Take, for instance, two line jobbers with good education, working in the same mill, same looms *and equal* distribution of stores. One will work harder than the other, also consume more stores, and give no better results, perhaps worse. One will make a picking nose last months longer than the other, and give better results. Why? How many line jobbers know how to test a sley in the loom if it is twisted and how to effect a simple cure. What trouble this can cause, especially in the fine trade, to the line jobber! A sley cap can be twisted and cause endless trouble—shuttle smashes, weft and warp breakages. It can be easily detected and a simple cure can be effected in two minutes' time. Like everything else it is easy where one knows how, but what about the poor line jobber who does not; what a struggle it is for him! Sley setting and pick setting must work in harmony. A certain modern Lancashire mill, known to the writer, has all its sleys set out of all proportion to theory, for certain reasons. In my opinion, theory in many cases to-day has outlived its sphere of usefulness. Another important thing; a line jobber who cannot make a good shed is useless. Here again, he should be taught a foolproof method, simple and constructive. How many hours are lost by line jobbers playing about and altering looms one way and another, where only the shuttle is at fault.

Times are changing, the peoples of India are becoming more educated, and education demands a higher standard and quality of clothes to wear, same as in other countries. With this I fully agree. Now let us ask ourselves, who is to play a big part in the making of these better quality cloths. The line jobber, of course. A good set of line jobbers to a mill is a great asset.

What I would like to see, therefore, is—our writers giving us something original, something new, food for thought, something that will set our minds thinking in another direction in 1944, and not keep reviving the relics of ancient times.

Internal Audit in Cotton Textile Mills

By C. A. THAKKAR, B. Com. (Bom.), F.C.C.S. (Lon.),
Internal Auditor, Asarwa Mills, Ltd., Ahmedabad

(*Specially Contributed*)

INTERNAL audit may be considered an important branch of management in any modern complex business or industrial organization. It means intelligent scrutiny into the internal working of the factory. It is concerned with account-books primarily but as all mechanical operations are ultimately reflected in some form or another in the books (financial or statistical), internal audit may be regarded in its broadest sense as embracing all the processes in the factory. It examines production (actual and ideal) purchases and consumption of stores, cottons, wastes, fuel and costs of finished products. It aims at aiding the management in the work of controlling the staff, establishing proper internal control, and ensures a high degree of accuracy of the books. It examines the system of accounting obtaining in each department, finds out flaws and supplies correctives, eliminates all unnecessary duplication of work everywhere so that (only) necessary work may be done in minimum time, maintains proper co-ordination between various departments, meets the accounting needs of an expanding organization and effects all necessary adjustments. In short, he aims at introducting the most ideal and up-to-date system of work (under the conditions current in the factory) and to make it both fool-proof and knave-proof.

The internal auditor draws necessary forms for various departmental production reports or improves the existing forms so that the management get the correlated information at a glance, and the correct figure-picture of the working of the departments is reflected for their consideration and action.

Codifying Procedure

The internal auditor codifies and standardizes the correct procedure to be followed in the case of various operations of purchases, production, consumption, and sales of different raw and finished materials, and issues standing instructions to the staff and insists upon their observance. He considers the staffing of each department with a view to ascertaining whether it is overstaffed or understaffed. The success of any organization depends upon the extent to which responsibility can be traced up to the last man in the rear. The internal auditor recognizes this canon and aims at introducing clear-cut division of work and unequivocal allocation of duties to the various members of the staff. The internal auditor introduces modern time and labour-saving devices particularly for work of a mental nature. He tries to introduce automatic counter-checks and cross-controls in the forms of books so as to eliminate chances of fraud, small or big, innocent or otherwise, and to reduce the degree of pure reliance to be placed on the staff by the management. He establishes proper departmental checks. Above all, he exercises independent and occasional checks which have deterrent effects on the staff. He discovers all waste of man-power (i.e., clerical energy) and tries to set them right.

Helping Annual Audit

The internal auditor can also take up some of the work connected with the annual audit of the financial accounts, leaving little to be done by the company's auditors. When the work of this statutory audit is thus decreased, the amount of audit fee to be paid to the company's auditor can be substantially reduced. Again, the internal auditor can be appointed honorary local auditor to the co-operative societies which may have been promoted by the company for the welfare of its workers.

The internal auditor establishes proper working standards for all departments, finds averages, prepares monthly comparatives and balancing statements which would reflect the progress of the departments from time to time.

The internal auditor has got to be something of a psychologist, over and above possessing necessary academic proficiency. He should be an adept in the art of handling different frames of mind. He has to recognize that people

Efficiency and Specialization in Post-war Reconstruction

BY B. M. BORKAR, L.T.M. (Hons.), *Spinning Superintendent, Bradbury and Phœnix Mills, Bombay*

(*Specially Contributed*)

IN the first session of the First All-India Textile Conference many schemes and projects were put forth by eminent technicians and speakers, but to my mind none suggested a feasible concrete scheme. Without any reservation on my part I should frankly admit that the present industrial system in India has apparently produced contented acquiescence rather than investigation and constructive schemes which could be put into actual practice. This state of affairs is not good on the face of it. It is said that industrialists, whose life is given up to business are by habit mindful of the future. Was anything solid achieved in particular in our first session of the first All-India Textile Conference, among so many things in general, regarding the advancement of technical efficiency and specialization pertaining to our textile industry? What is the place that efficiency and specialization are going to get in the post-war reconstruction of our textile industry? It is time to admit the blunt truth that we have so far failed pretty dismally on this point. There has been, in fact, too much talk and too little action on our part. Most of the decisions of the Conference, no doubt, would enable our managements in general to keep an effective check on labour and industry. While this is all to the good, no constructive scheme in general, and for efficiency and specialization in particular, was conspicuous and there is danger that the lack of such schemes might jeopardize the successful working of the technical aspect of the textile industry in the post-war period. The industry will have to face the difficult task of tackling the problems of industrial peace in the post-war period with redoubled vigour and skill. Our method and machinery should be completely overhauled for the rehabilitation of our textile industry so that we can really count and be proud of our industry as a real national economic asset!

Coming to our subject proper—Efficiency and Specialization—we see that men from the streets are recruited in our industry by jobbers and they—unskilled as they are—are placed on jobs where skill is required until such time that they become used to skilled work on those particular posts. Thus we see that a raw man is given the machine for handling without any previous knowledge of the machine he is going to handle. This state of affairs should be stopped in the interest of our industry's future. With due respect and regard for the existing conditions of machinery and man-power, we have introduced rationalization in our mills with best results. Why not adopt specialization and make it a success?

In my opinion post-war labour should be divided into two classes: skilled and unskilled. (1) Skilled, e.g., machine workers fitters, oilers and jobbers, etc. (2) Unskilled, e.g., coolies, hand feeders, sweepers, bobbin carriers, etc.

Recruitment should be adopted on new methods and it should be done in the presence of the manager, the departmental head, the labour officer and the mill doctor. This system will eradicate the existing evils of underhand dealings, jobbers' influence, bribery and corruption. Let us call this system "co-operative recruitment." The appropriateness of this system will mainly depend on the measure of co-operation that comes from all sides. The committee of four, in short, will form a scrutinizing section by (1) eliminating jobbers' influence, (2) testing a worker's minimum educational qualifications, (3) certifying the physical fitness of the operative, and (4) taking away the "tomorrow we die" feeling from the worker because of the subtle victimization in the department. Our present system which employs unskilled operatives on skilled posts results in increased wear and tear. I am aware of the question of skilled labour supply being difficult. When an unskilled

C

person works on the machine, we all know that the effect on the machine is detrimental. I maintain this is a sheer wasteful method of recruitment of labour to our industry. Look at the position as it exists in our mills to-day. Let us take a fitter, for example. Ignorance and illiteracy generally are his traits to-day. We never judge his standard of education nor his ability at the time of his promotion. Instead of this, if some sort of compulsory tuition is given to him through the mill staff or the Social Service League classes of the knowledge of machinery which he is going to handle, the prevailing idea that our management recognizes labour by fits and starts would be without any backing and argument.

I do not understand why a man, when trained for certain kinds of machines, should be changed from that post and put to some other machine about which he is ignorant. Specialization and specialization alone should be our next campaign. Specialization and efficiency always go hand in hand. Our experience has so far shown that when a specialized oiler is given a jobber's post the oiler becomes a puzzled animal in a jungle-beat. The specialized oiler thus becomes a non-specialized jobber and the non-specialized oiler who is brought in the place of the original oiler has to pose as a specialized oiler. Thus the jobber and the oiler both turn novices in the line. Departmental heads and assistants who consume their very energy in turning an operative into a specialized operative also get disheartened and do not bother much when they see that the ever-changing line of men—skilled or non-skilled—is being promoted every now and then without any discrimination. They have neither the patience nor the energy to teach every new-comer his job every time anew with the same energy and vigour they taught an old operative working for many years on the same job. If this state of affairs is not to be repeated and specialization is to be adopted for the improvement of the industry, gradation scales of pay should be adopted. The highest limit must be fixed beforehand, say, Rs. 60 for an operative in specialization grade. Start him on Rs. 30 and gradually give him increment by scales every year. The criterion in fixing the minimum and maximum of the basic wage should be that he should reach the maximum on which his immediate superior was started. Let us take the case of an oiler. Let him start as an oiler, work as an oiler and die as an oiler and, above all, a *specialized* man. Such a man will do his job more efficiently and carefully and economically than any one else. We should always remember that this cultivation of specialized technique is nothing more revolutionary than developing and utilizing a latent talent in that particular worker.

If only there was specialized labour with our industry to-day, exceptionally rapid deterioration of our textile machinery would not have resulted under the present war conditions when stores and spare parts are so scant. Because no experimental scheme of this nature has hitherto been operated in any part of India, we should not, however, on this account neglect indefinitely the introduction of specialization. My idea of specialization is in the perfection of the workers' powers of mind and the job. The formal shackles of the old system must be broken and workers should be encouraged with the importance of specialization and its advantages. We all know that a good many workers are hopeless failures and were doomed at the start. But under the existing system they are not only doomed at the start but also doomed till the last. Workers do not like to be told that they are nothing but blundering specialists! A fitter thinks it below his dignity to remain a fitter all his life. But in my opinion, for a fitter to remain a fitter—a specialized fitter—is not at all something nasty, but rather something honourable and praiseworthy. After all, all these distinctions in designations and posts lead ultimately to one thing—their *speciality.*

All this talk of ours deals with time-workers whose standard of wages is fixed. But what is the position with regard to the skilled piece-workers such as weavers, etc. The answer is simple. They get specialized as the years pass on and their efficiency also improves. But here also we should place a limit to the highest point of one's efficiency. I would suggest through this scheme that a monthly allowance of a rupee or so should be given as speciality allowance after the completion of one year's service provided the operative keeps up to the mark of his efficiency. Thus after completing two years' service, he will be getting two rupees as speciality allowance, and as the years pass by a rupee will be added to his speciality allowance until he reaches his maximum allowance of Rs. 10 after eleven years of service—a service which is fairly equitable to make a weaver a specialized weaver.

Thus the labour will not only be a specialized labour but also a stabilized labour. One need not be frightened that the industry will have to pay too dearly for such a scheme, when one is convinced that the average speciality allowance will not be anywhere beyond Rs. 5 per head. And I am sure that this will be amply compensated by the standard of efficiency and better quality of production as a result of thorough specialization.

Non-skilled labour will always be a rolling stock. We should not bother much about this class of labour. But our skilled labour should always be specialized. He should be taken care of from the start. During the *badli* period, training should be given to him and he should pass the necessary test in the form of an examination before he is made permanent. He should also be certified by the medical officer of the mill for his physical fitness. Minimum educational qualification such as vernacular final and a little knowledge of English in our skilled labour should be emphasized. For this literacy campaign would have to be vigorously started. The teaching of adult illiterates is a new field. But once they are literate (by literate, I mean sufficiently educated and not qualified), they will present themselves at mills and factories like devotees at a shrine with a realization that the management they seek to undermine is the very basis of their future and well-being. Is it not equally obligatory on the part of the management to find ways and means for the well-being of this superabundant labour energy which seeks recreation in nauseating strikes on frivolous and personal differences? We all know what happens and how it happens when an oiler is promoted to a jobber's post. The oiler pays something in cash or kind to the head jobber and the head jobber, recognizing what he should do in return, agrees to report favourably regarding his work to the departmental boss. School leaving examination for the jobbers is quite sufficient for a jobber to justify his post and in addition Social Service League certificate should be made a compulsory qualification. Promotion in salary according to qualifications should be encouraged.

The Indian cotton textile industry is India's biggest industry in which more than Rs. 40 crores are invested. The profit margin at present of even a small mill every month is more than the profits made during the whole year of pre-war days. But this is our temporary gain. The post-war slump will be so catastrophic that the industry should rise to its responsibility now by suggesting constructive schemes which would place our industry in a sound position. The future historian should not record that the present industrialist, dazzled with the war-time prosperity, failed to see the post-war slump and thus deprived himself of the necessary strength to overcome the difficulties by not rising to his responsibility. We shall have to resort to rationalization and greater specialization of textile labour.

Internal Audit in Textile Mills

(*Concluded from page* 104)

who are already working in the rut are not likely to relish any interference with their methods from outside. They will put up resistance to his suggestions. The auditor has got to be very tactful and courteous in dealing with them. A sympathetic and agreeable disposition will enable him to convince them and win them round. Though he is clothed with necessary authority, it is not advisable for him to try to force his will on the staff. The members of the staff are not all creatures in logic; they are bundles of emotions, with strong likes and dislikes. With pleasant persuasion only can the auditor succeed in convincing them. The auditor has got to be sociable, commensurate with dignity. He has to reconcile two apparently antagonistic views of the staff and of the management and by improving the methods of working, he adds imperceptibly to the efficiency of the works as a whole, as well as of the individuals comprising the works—a distinct gain to both. He is an invaluable asset to the concern he is serving.

The British Electrical Industry

Its Contribution to Victory

DURING the early years of the nineteenth century many distinguished scientific men were investigating the phenomena of electricity, but until the attention of engineers was drawn to its possibilities no electrical industry could be said to exist. Great Britain was famous then for wise and skilful craftsmen in the engineering field, as she still is to-day. The great concerns of the north of England, the home of the millwrights and iron smelters, of the Maudslays, of Watt and Stevenson and many other pioneers, were often founded by men who worked in their shirt-sleeves at bench or forge, took their orders in person, and kept their accounts in little note-books.

Steam was then their source of power; but the tributary streams of electrical knowledge were gathering force, and when in 1831 a climax came with Michael Faraday's triumphant demonstrations of electrical induction—the principle of the transformer, and of the production of electricity from magnetism—the principle of the dynamo, the electrical industry was born. Faraday was himself a craftsman. With his own hands he built his apparatus, made his instruments, wound his electromagnets in his room at the Royal Institution, London; and as surely as the acorn contains the oak, from his creative discoveries our modern electrical industry is derived. Before his time many others had examined, experimented, recorded; but it was he who made the fundamental experiments and with infinite perseverance and extraordinary insight deduced from them the principles of electrical action.

Apart from telegraphy—in which, again, two Englishmen, Cooke and Wheatstone, were among the pioneers—illumination was at first regarded as the chief use of electricity. Years had to pass, and the industry had to establish itself in lighting, before the need for research on a large scale was felt and the conviction gained ground that hardly any limit could be set to the possibilities of this mysterious force. Individual manufacturing firms such as The General Electric Co., Ltd., of London, carried on their own investigations into technical development as an aid to progress; as in the old days, British engineers proved their skill, and the combination of scientist, engineer and electrical specialist evolved what we might term a new breed of men who took the lead in developing all branches of the growing industry and in a few years were to win the admiration of the whole world. Rapidly they expanded its scope. Generation, transmission, distribution became almost a separate science; the power station displaced the little "electric light works"; for the first time electricity became linked with heavy engineering. It drove the machine tools in factories, provided heat for the furnaces of metallurgical industries, for welding, for industrial cooking. In brief, it served the ever-increasing and never-ceasing activities of the country.

Electricity supply, of course, became more highly organized as time went on, and this organization reached its climax with the construction of the British Grid with its 132,000 V. main transmission lines—a magnificent achievement of British electrical engineering.

How, then, industrially speaking, did the nation react to the shock of war? A shock may paralyse energy, or stimulate it. There is no doubt about the answer. Thanks to the enterprise of the electrical manufacturing industry and to the untiring work of the research scientists, the country found itself well prepared for the urgent change-over from peace-time production to the needs of the armed forces; in fact the entire business and industrial personnel of the nation was ready and alert, as fully equipped with inventive ability, as full of vitality, as it had ever been. One of the most remarkable characteristics of the British people is their resilience, their entire inability to imagine the possibility of defeat, a quality of incalculable value when danger threatens. With scarcely any confusion or disorganization, the whole of the nation's industries were mobilized and directed to the economic effort of war, and gradually the best and most complete use of labour, machines, and materials was secured for the common purpose. Once more the old adage has proved true—unity is strength. And when the industrial history of the war years comes to be written, the contribution of the British electrical industry to that common purpose—the winning of victory—will prove to have been one of the strongest cords of all in that essential unity. Few people, perhaps, have a clear idea of the enormous significance of that industry to the war effort. When it is realized that no plane could fly without electrical equipment to operate the auxiliaries, no ship could sail without its electric power being in perfect working order to provide energy for the hundred-and-one purposes where electricity is required aboard ship (including the all-important one of illumination), no mechanized army could fight without its electrical accessories—tanks, self-propelled guns, armoured cars, transport vehicles, ambulances, etc., all, lacking electrical aid, at a standstill as surely as though the life-giving petroleum had suddenly dried up—it is easy to imagine the immensity and complexity of the task so successfully overcome.

The main source of the growth of the British electrical industry is often hidden behind the scenes. "During this war," said Lord Woolton recently, "the scientists of Great Britain had led the world. All the great discoveries of the application of science to war had come from our scientists at home, and we have reason to be very proud of them. In the electrical industry research has taken place on an enormous scale, and that industry has served the nation with very great distinction."

But war, we may be thankful to remember, is a temporary condition; however long it may last, peace is the normal state of healthy national life. Therefore, it is pertinent to take a forward glance, to ask how all this magnificent effort, concentrated on a single aim, can be distributed once more into the innumerable channels awaiting it when peace comes. The question cannot be answered in detail, obviously, for one result of war is an immense and comprehensive stimulation in the technical field, so that in every branch of science advances are made much more rapidly than in the calmer and less arduous atmosphere of peace. Especially is this true of electrical science, and if we consider the vast research and manufacturing resources of an organization such as **The General Electric Co., Ltd.**, the largest of its kind in the Empire, devoted for years to the production and development of equipment for the war effort, it is certain that when peace comes the experience gained will be of inestimable value. Every application of electricity including the very important new advances in electronics—comes within its province. Serving every essential industry, the new knowledge gained will be at the disposal of all who are concerned with reconstruction, and—another point worth noting—those who control this great British electrical enterprise have not forgotten to prepare, during the war-period, for a speedy transition to peace-production.

Much of the development in the years of war is necessarily of a secret nature; the science of radiolocation, for instance, is only one of many examples that might be mentioned. The main point to remember is that all these fresh applications of electricity will find their place in the requirements of peace; that British resource, skill and craftsmanship are no less sure than in the days of old; and that the British electrical industry is equal, as it always has been, to any demands upon its unrivalled service that the future may bring.

The Bihar Charkha Kambal Ashram Ltd.

Nasriganj, Shahabad

IN a remote corner of Bihar, where for 14 miles on either side no modern transport facilities are available, there exists a very successful band of social workers called the Bihar Charkha Kambal Ashram Ltd., who have organized a modern wool spinning and weaving centre where technical training is imparted to more than 200 villagers including 25 women. This Association has formed other branches in different places, two in Gaya District, one at Rafiganj and the other at Nabinagar where about 600 poor families earn their living in wool spinning work. One branch is at Dehri-on-Sone (Shahabad) and a branch has been recently opened in 46 Cross Street, Calcutta, for the sale of its products. The Ashram has 12 main departments such as spinning, weaving, dyeing, carpet manufacturing, sheep rearing, carpentry, smithy, shoe making, sales, propaganda and teaching section, etc., each department being under the charge of a responsible officer. The Managing Director is Baboo Ram Swaroopjee.

The "Vyayamsala" is generally attended by almost all the inmates of the Ashram. There is a library with a reading room.

The second prize-distribution ceremony of the Ashram was held recently under the presidentship of Dr. H. K. Sen, Director of Industries, Bihar. The function began with prayer and welcome songs, after which Dr. H. K. Sen, Director of Industries, Bihar, and Mr. N. P. Neemuchwala, Textile Expert to the Government of Bihar, were welcomed by the Managing Director, Baboo Ram Swaroop, after which separate addresses were presented to them.

Baboo Jaganarayan Prasad, Director of the B. C. K. A. Ltd., then read the report of the Ashram and Dr. H. K. Sen distributed more than a hundred useful prizes like brass utensils and clothing to the winners.

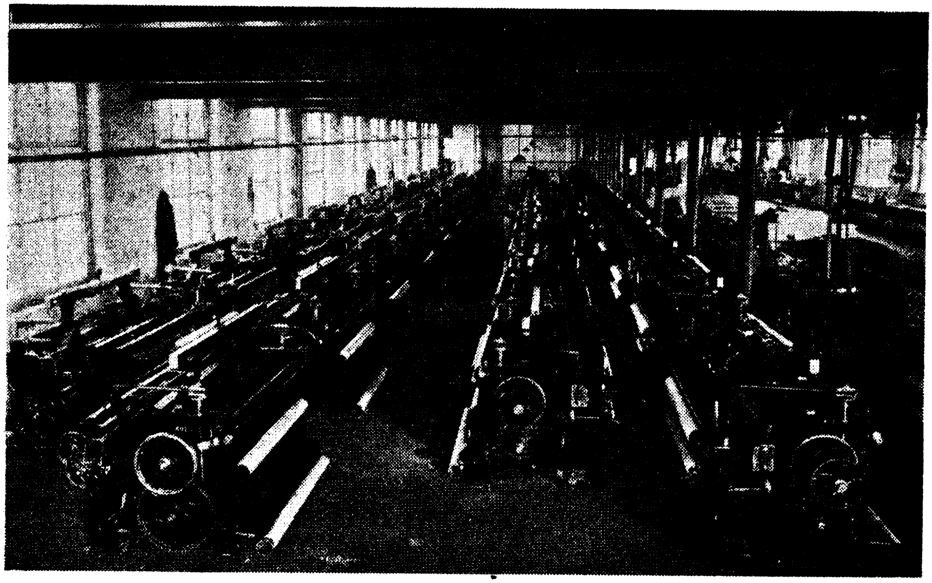
Mr. N. P. Neemuchwala congratulated the promoters of the Ashram and emphasized the usefulness of such bodies in a backward province like Bihar and in a remote corner like Nasriganj. He assured them of Government recognition of their training, when they reach the levels obtaining at the Government Wool Institute, Gaya, Government Silk Institute, Bhagalpore, and Government Cottage Industries Institute, Gulzarbagh, Patna. He also expressed appreciation of the services so far rendered by the Ashram to the Government in supplying a larger number of blankets through the Wool Emporium, Gaya, to the fighting forces and he thanked them for their generous donation of one hundred blankets worth Rs. 525 to the Bengal Relief Fund and for another generous donation of Rs. 250 for the Red Cross, Rs. 50 to the Royal Indian Navy Benevolent Association and for taking part in the War Services Exhibition held at Patna at its own cost.

Robert Hall & Sons (Bury), Ltd.

Completes One Century of Textile Machinery Making

THE well-known firm of textile machinery makers, Robert Hall and Sons (Bury), Ltd., was founded in 1844 and so celebrates its centenary this year. It was actually started in April ; the first week's wages, recorded in a wage book which is still in possession of the firm, being paid on 13th April 1844 and amounting to £8 14*s*. 10½*d*. There were four partners, Squire Diggle, William Tuer, William Hodgson and Robert Hall. The first of these, Diggle, retired soon after the business started and the firm became known as Tuer, Hodgson and Hall, and it is recorded that these three partners carried on a partnership without deed, articles or written agreement. William Hodgson retired in 1860 and the style of the firm became Tuer and Hall. In 1862, William Tuer died and the business was carried on by Robert Hall alone in his own name until his death in 1888. He left it to his three sons, Samuel, John and Robert who continued under the name Robert Hall and Sons, until 1895 when it became a private limited company under its present title. At the present time, a great-grandson, Mr. Gerald K. Hall, is Chairman and Managing Director, another great-grandson, Mr. O. Herbert Hall, Director and Secretary and a grandson, Mr. Wm. H. Hall, a Director.

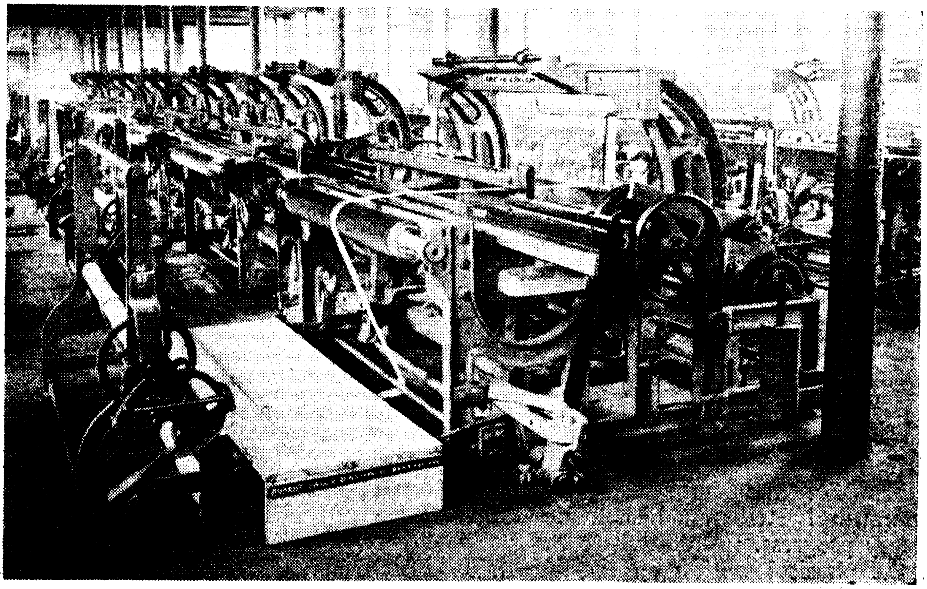
Records of early achievements are somewhat sketchy and incomplete with the exception of the wage books which are complete from the beginning. It is, however, known that right from the start, the firm has specialized in looms and other textile machinery, although they also undertake general engineering work, and in their early days made steam engines, some of which, made in the 40's, were working up to a few years ago. Other machinery made nearly 100 years ago, is still at work in some places, though such old machinery is now rightly being rapidly replaced by new, and in many cases, by up-to-date types made by Messrs. Hall. When the four partners started, they seem to have acquired a building somewhere near the middle of the present site which covers an area of over 2 acres. Progress has always been constant, new buildings were erected from time to time and as years went on these were modernized or replaced, and so far as can be stated with any certainty, it is probable that the oldest part now in



Light Loom Department

existence with the exception of perhaps certain walls, dates back to 1876. From that year onwards until the present century appears to have been a time of consolidation and improvement of what had been put down. Then during the first 25 years of the present century, certain new buildings were put up and, more recently, developments have been in other directions, not so noticeable but still important. The aim of the firm has always been to give satisfaction to users by producing machinery which is efficient and will stand up to the work required of it without unnecessary complications, in other words, simplicity has been the idea and the fact that the firm retains many customers on its books almost since the beginning and is constantly finding new ones, proves the wisdom of the policy.

Many outstanding achievements stand to the credit of the firm, such as the Heart traverse motion for bobbin winding machines—patented by Robert Hall over 70 years ago and which, it is said, has never been surpassed, Hall's eccentric drop box motion which is one of the best of its kind, the Moxen wire motion for carpet looms perfected by them and other outstanding inventions. In recent years, they have built a number of wide looms for special purposes up to 36 ft. wide, also exceptionally heavy looms capable of weaving fabrics one inch and even more in thickness. They are also always willing to design machinery for special purposes. Lately, individual motor drives have been very popular and types have been evolved suitable for practically every loom and machine the firm makes. They are highly successful and very efficient and if users of their machinery follow their advice, they may be sure of having a drive which in the first cost may not always be the cheapest, but in the long run will be most efficient. The firm's business has been world-wide and normal work is, of course, greatly restricted on account of war conditions, but it can safely be asserted that when hostilities cease Messrs. Robert Hall and Sons (Bury), Ltd., will be to the fore as makers of modern textile machinery. They possess their own foundry, blacksmith's shop, machine and fitting shops, and also have extensive woodworking departments and so are able to design machines made in the best way for the purpose in view, whether the predominant material be cast iron, steel, wood or other material, and use these different raw materials in the most effective way. Their representatives in India are Messrs. Marshall, Sons & Co. (India), Ltd., who have offices in Bombay, Calcutta, Madras and New Delhi.



Fitting Department for Sail Cloth and Duck Looms

Progress in Chemical Technology

Bombay University Department's Report For 1943-44

Evidence of Co-operation from Industrialists

INVESTIGATIONS subsidized by the following industrialists, industrial organizations or Government Departments were completed or were in progress at the Department of Chemical Technology, University of Bombay, during the year 1943-44:

Sir Ness Wadia, K.B.E., C.I.E., Bombay; Rajderkar & Co., Bombay; Imperial Chemical Industries (India) Ltd.; Anil Starch Products, Ltd., Ahmedabad; Pioneer Magnesia Works, Ltd., Bombay; Indian Central Cotton Committee, Bombay; Imperial Council of Agricultural Research; and the Board of Scientific and Industrial Research of the Government of India.

The graduates of the Department have found employment with Kesoram Cotton Mills, Calcutta; Imperial Chemical Industries (India) Ltd.; Vasant Vijay Mills, Bombay; Modern Chemical Works, Dhulia; Anil Starch Products, Ahmedabad, and the Pioneer Chromate Works, Bombay. Besides, the management of the following mills and factories permitted the students of the Department to work as apprentices :—

Morarjee Goculdas Spinning and Weaving Co., Kohinoor Mills Co., Finlay Mills, Shree Ram Mills, Khatau Makanji Spinning and Weaving Co., India United Mills, Standard Mills Co., Bombay; Mafatlal Fine Spinning and Manufacturing Co., Navsari; Shree Sayaji Mills, Baroda; Lakshmi Cotton Manufacturing Co., Sholapur; Navsari Cotton and Silk Mills, Navsari; Dharamsi Morarjee Chemical Works, Shree Niwas Cotton Mills, Pioneer Chromate Works, Imperial Chemical Industries (India) Ltd., D. C. M. Chemical Works, Delhi; Mettur Chemical and Industrial Corporation, Trichinopoly; and Tata Chemicals, Mithapur.

The wool research scheme under the auspices of the Imperial Council of Agricultural Research has made satisfactory progress. In addition to the work in the physical section on the lines laid down originally investigations have been undertaken on the chemical side on the grease, nitrogen and sulphur contents of wool.

The following schemes were in operation under the auspices of the Board of Scientific and Industrial Research :— 1. Preparation of vat dyes. 2. Determination of the constitution of some commercial dyes. 3. Synthetic dyes and modified shades from cutch. 4. Preparation of aniline from chlorobenzene.

Half-yearly reports on the progress of these investigations were submitted to the Board. A series of papers on the results obtained are under preparation. The process for the preparation of standardized dye extracts from plant materials developed under the auspices of the Board of Scientific and Industrial Research has been purchased by a Calcutta firm. A process for the preparation of an extract of the essential tinctorial constituent of annatto dye for use in colouring foods has been purchased by a Punjab firm.

The Department continued to render assistance to the Chemicals Directorate and the Cotton Textiles Directorate of the Supply Department. The preparation of the insecticidal chemical and the dye referred to in the Annual Report for 1942-43 was continued during the year. Minor quantities of other chemicals have been supplied and negotiations are under way regarding the large-scale production of an azo dye.

Analytical Work and Technical Investigations

There has been marked expansion in the work of the Analytical Section. The inquiries dealt with during the year amounted to 209, involving 451 analytical estimations, as against 108 inquiries and 160 tests in 1942-43. This rapid increase in work was in spite of the fact that no samples were accepted for analysis for about two months, when the transfer of the department to Matunga was in progress.

Besides routine analysis, a number of investigations were undertaken and completed, e.g., bleaching of silk fabrics to a perfect white and fastness of khaki-dyed materials.

Of the total number of samples received for analysis, about 70 per cent. were from Bombay Province, and the remainder were from places as far removed as Radhanpur, Cawnpore, Gwalior, Morvi, Jullundur and Indore. About 40 per cent. of the work related to textiles, involving the analysis of starches, desizing agents, wetting agents, dyes, water, etc. In addition to analysis and investigational work, the section has also prepared and supplied a few chemicals to local firms. The Research Assistant for Preparations has been engaged in the preparation of organic chemicals required for the University examinations.

The work of the section has indicated a general tendency towards unskilled adulteration. Thus starches have been very commonly mixed with tamarind flour, *udad dal* and even clay ; gums have been found to be mixed with china-clay or starches ; sulphur blacks have been liberally mixed with coal dust ; a sample of sodium sulphate was passed off as barium chloride ; castor oil soaps are being sold as vegetable tallow ; and numerous cases of a similar character are being repeatedly detected and reported upon.

The following are some of the additional items of equipment purchased for the department during the year :—Extension to the cylinder drying machine, which now has 15 cylinders ; special developing range for mineral khaki ; extension to the open soaper ; 10-gallon cast iron oil jacketed mixing vessel ; General Electric model, 12 c. ft. refrigerator ; cast iron steam jacketed chemical pots ; reducer complete with all accessories ; six electric motors ; and weighing machines.

Higher Research Degrees

The following students qualified for higher degrees by research :

Student	*Degree*	*Thesis*
S. H. Mhatre	M.Sc.Tech.	Hypochlorite oxidation of cellulose in presence of reduced vat dyes.
R. J. Phadke	Ph.D.	A new method for the synthesis of polyhydroxy flavones.
K. S. Khandheria	M.Sc.Tech.	Action of light on some organic colouring matters.

Progress of Research Work in the Department

The results of the research work carried out in the department are published either as independent bulletins or as articles in scientific and technical journals. Among the papers so far either published, or forwarded for publication, or ready for publication, mention may be made of the following :—

Technical education ; wetting agents in textile processing ; anthraquinone vats dyestuffs ; use of emulsified organic solvents in kier boiling ; experiments on mineral khaki; Bombay University wool research scheme ; the nature of Indian wool and an examination of its physical and chemical properties ; cellulose in the presence of reduced vat dyes ; action of light on some organic colouring matters ; colour fastness standards ; various light sources as colour fading agents on textile materials.

Of the work that is in progress at the Department's laboratories and that is expected to continue during the year 1944-45 we may refer to :

Preparation of alizarine and indanthrene blue; vat dyes from benzonthrone and aminoanthraquinones ; sulphurised and halogenated vat dyes ; constitution and purity of certain commercial dyes ; synthetic dyes from catechin ; pigment colours in printing ; azoic dyes ; dyes with surface active and chemo-therapeutic properties ; anthraquinone dyes ; dyes with cashew-nut shell oil ; starch products and oxidation of starch, and chemical finishes on short-staple cotton yarns and fabrics.

Mechanical Harvesters to Reduce Cotton Production Costs

MECHANICAL cotton harvesters that will lower production costs and increase efficiency seem to be American cotton's answer to the challenge of synthetic fibres and foreign cotton production. These were displayed in Dallas, U.S.A., at the 1944 Cotton Research Congress.

" How Cotton Can Meet To-day's Challenge " was the theme of the Congress, sponsored by the State-wide Cotton Committee of Texas, and numerous exhibits of cotton pickers, strippers, choppers, dusting equipment and other machinery were convincing evidence that American inventive genius is prepared to meet the challenge.

Such an exhibit of mechanical harvesters would not have been possible a year ago, because some of the machines have just been developed and improved to the point where their manufacturers are ready to display and demonstrate them.

Exhibited at the Congress were a number of different machines made by commercial firms divided into two types: the picker and stripper type.

Holidays With Pay to Factory Workers

Government Bill in Central Assembly

IN moving that the Bill further to amend the Factories Act 1943 (Second Amendment) be referred to select committee, the Hon'ble Dr. B. R. Ambedkar, Labour Member, Government of India, said:—

The provisions of the Bill fall into two parts. Part I of the Bill deals with compensatory holidays for the loss of compulsory holidays. In section 35 of the Factories Act it is obligatory upon the owner or manager of the factory to give one compulsory holiday to every adult worker in the factory. This provision is subject to the provisions contained in sections 43 and 44. Sections 43 and 44 provide that the Inspector of Factories may permit exemptions being granted to the manager of the factory or factory owner from the obligations imposed by section 35. The view that is taken is that when such exemptions are granted, they ought to be compensated by other holidays, equivalent in number. Health and efficiency of the worker requires that he should have the requisite number of holidays which are prescribed by law.

The Act, as it stands, makes no such provisions for compensatory holidays. Consequently, clause 2 of the Bill has been introduced for the purpose of removing this lacuna. It will now be open for the provincial Governments to make rules subject to certain adjustments that wherever exemptions have been granted under section 35, compensatory holidays of the equivalent amount shall be granted to the workmen.

Labour Convention

Coming to the second part of the Bill, the provisions contained therein deal with the question of holidays with pay. In 1936 the International Labour Conference passed a convention relating to it. The Government of India, which was represented at that International Labour Conference, was not prepared to accept the convention and to ratify it, and they moved a regulation in the Assembly on the 26th July 1937 proposing the non-acceptance of the convention.

The resolution was carried. But while the Government did not find itself in a position to ratify the convention, the member in charge of the resolution said that the Government would explore and examine the possibilities of giving effect to the convention, if not wholly at any rate in part, and undertook to have consultation with the provincial Governments and all the associations representing the employers and employees to find out to what extent there was a general agreement in the matter of this convention. Part II of the provisions which relate to holidays with pay are the result of this examination and exchange of views which have been going on over a considerable number of years.

Turning to the Bill itself, it will be seen that it applies to perennial factories only. It is undoubtedly limited in its scope as compared to the provisions contained in the convention which was adopted in 1936, but as a beginning it should be welcome. The other provisions could be covered by the four different points which need legislation dealing with holidays, viz., length of holiday ; qualifying conditions for a right to a holiday ; limiting conditions ; pay during holiday.

With regard to the first point, namely, length of a holiday, this is a matter which is dealt with in the new section 49B which the Bill proposes to add to the Factories Act. According to this section, the total holiday is to be on seven consecutive days for a worker who has put in continuous service for one year. In fixing this period of seven days, Government have followed the provisions contained in the Geneva convention of 1936 which laid down six days as the limit of the holiday. To that a seventh day has been added, which is a compulsory weekly rest granted to a worker under section 35 of the Factories Act.

With regard to the question of qualifying conditions laying down as to when a worker will be entitled to claim a seven-day holiday, the provisions contained in the Bill are as follows: As a matter of fact, there is really only one condition and that is that the worker must have put in a period of twelve months' continuous service. There is no other condition. With regard to the question as to what is continuous service of twelve months, the Bill provides for what are called interruptions and declares that certain interruptions shall not invalidate the claim for holidays with pay. The interruptions which are mentioned in the Bill are interruptions arising out of sickness, accident, authorized leave, lockout period and a strike period, provided the strike is legal.

Involuntary Unemployment

There is also another provision in the Bill which relates to the same subject and that is the question of involuntary unemployment caused by the desire of the factory owner to close the factory, and limited to a period of 30 days. If the involuntary unemployment caused by the factory manager does not extend beyond 30 days, then that would not invalidate the claim of the worker for his right to holidays with pay. Holidays with pay must necessarily take into account the ability of the manager or the factory owner to pay, and if the manager or the factory owner is obliged to close his factory for more than 30 days, then it is legitimate to presume that he has really not been prospering as well as he ought to and that he is therefore not in a position to pay the cost for holidays with pay. But if the involuntary period does not exceed 30 days, then the presumption is that he is still able to bear the cost and should bear. The Bill also provides for limited conditions with regard to holidays with pay, and that limited condition relates to the question of accumulation of holidays. The Bill provides that a worker who has been qualified to earn his holidays may be entitled to accumulate holidays for two years and that is for a total period of 14 days.

The first point *re.* pay during holidays is that although the total period of the holiday is seven only six are declared to be paid holidays. The seventh is really a day of weekly rest provided under section 35. With regard to the seventh day, the Bill does not make it obligatory upon the employer to pay for it. But at the same time the Bill does not take away the right of the employee to demand payment, if as a matter of fact as a result of his contract of service that holiday was due to him as a paid holiday. It is really left to be governed by the contract of service. The third point is with regard to the payment to be made for these six holidays. The rule that we have adopted in the Bill is a rough, equitable rule and it is this : a worker is to be paid at a rate equivalent to the average of his earnings during the three preceding months barring overtime. The Bill also provides that in order to enable a workman to take his holiday, some facilities should be given him in order to have some cash with him on the day on which he proposes to start on his holiday. Consequently provision is made in the Bill that half the dues which are to be paid to the workmen going on holiday shall be paid to him at the start.

Another matter which is relevant to this and is also important is this. The Bill proposes to exempt certain factories from its operation if it is found that a factory has a system of holidays with pay which is substantially similar to the one provided in the Bill and about whose satisfactory character the provincial Government is able to certify. The object underlying this clause is that if there is a voluntary arrangement between the employer and the worker whereby the worker is given the same privilege which we are providing in the law, the view taken by the Bill is that in so amicable an arrangement it is unnecessary for the law to enter.

The questions of discharge of a workman by the employer to prevent him from earning his holiday and of the employer inducing a workman not to take his holiday although he has earned it are not being provided for in the Bill. The view of Government is that at the present stage, at any rate, there is no reason to suppose that such contingencies will arise. If experience shows that such cases do become usual it would be time then to amend the Act to stop their recurrence. For the moment the provisions of the Bill are sufficient for the purposes which it has in view, namely, to grant holidays with pay to factory workers.

War Risks Insurance of Goods and Factories

How They Operate in India

WAR risks insurance in India is governed by two schemes, viz., the War Risks (Goods) Insurance Scheme promulgated in October 1940 and the War Risks (Factories) Insurance Scheme promulgated in April 1942. Under these two schemes the Government of India provide cover against land war risks for goods for sale in business, factory properties, etc.

Both the schemes are based on the compulsory principle, so as to distribute the risk evenly over vulnerable and non-vulnerable areas in order to keep the rate of premium as low as possible.

The total receipts under the War Risks (Goods) Insurance Scheme up to the end of the third year of its operation, i.e., up to 30th September 1943 amounted to Rs. 11,86,90,369, against a total expenditure of Rs. 13,43,516 only. During the first year of its operation, i.e., up to 31st March 1943, receipts under the War Risks (Factories) Insurance Scheme amounted to Rs. 9,07,89,880, against a total expenditure of Rs. 4,09,255 only.

Under War Risks (Goods) Insurance Scheme, insurance is compulsory if the value of all such goods owned by the seller thereof and held by him in any one Presidency town or district exceeds Rs. 20,000; in other cases insurance is optional. Insurance is by quarterly periods and the rate of premium, which was originally fixed at half-anna per one hundred rupees per month, has been revised from time to time; the rate for the October-December 1944 quarter is one-anna and three pies per month for every complete sum of Rs. 100.

The Factories Insurance Scheme, though designed primarily to cover factories (as defined in the Factories Act of 1934), also applies to certain other properties, e.g., above-ground machinery of mines, the distribution and transmission systems of specified gas, electricity and hydro-electric undertakings, and inland vessels of specified trading corporations. This scheme is worked on a single premium basis. The period of insurance was originally fixed for two years from 1st April 1942 in respect of all properties, other than inland vessels in which case the period was one year from 1st April 1943. Both these periods have now been extended to 31st March 1945. The rate of premium for the entire period is 4 per cent. of the insurable value of the assets in the case of inland vessels, and 5 per cent. in the case of factories insurable under the scheme.

War-time Industrial Expansion in India

Seven-fold Increase in Production of Parachutes

CONCENTRATION on the production of parachutes, changes and improvements in the patterns, designs and modifications of clothing required by armed forces, larger increases in timber production, further expansion of industries for miscellaneous stores and continued exploitation of indigenous sources for the manufacture of drugs—these were some of the main features of the activities of the Directorate General of Supply in the fifth year of war.

The manufacture of parachutes generally and of supply dropping parachutes particularly has increased sevenfold in the last year. Rapid strides have been made in the production of cotton parachutes. Between January and August 1944 production has stepped up to more than three times the figure for the number of parachutes manufactured from the commencement of production to December 1943.

Equipment of Parachutes

The manufacture of a special type of parachute has again been taken in hand and there are indications that considerable increases in production will shortly be established. India also continued to manufacture equipment dropping parachutes for which Indian silk was used. Ancillary equipment for all types of parachutes have also been manufactured in proportion to production of parachutes. This important war job is being done at two Government factories solely employed in the manufacture of cotton parachutes and one factory in the manufacture of man dropping and equipment dropping parachutes and ancillary equipment.

The year 1943 was the peak year with regard to supply of tailored items of clothing. India was then the nearest supply base for armies operating in the Middle East and in March 1943 over 12 million items were fabricated. In the fifth year of war the ordnance clothing factories were called out to supply just under 7 million items a month. With reductions in demands for clothing and with increased demands for parachutes it was possible to turn over one ordnance clothing factory completely to parachute work. Another factory has been split into two, one for clothing and one for parachutes. There are thus now 8 ordnance clothing factories fully employed on fabrication of tailored items of clothing and necessaries, employing a labour force of 90,000 excluding the indirect labour employed by tailoring contractors throughout India. Some idea of the combined output of these factories during the period under review can be had from the fact that they accounted for and converted some 215 million yards of textiles, over 5,600 million yards of sewing threads and over 500 million buttons and numerous minor components into 78,941,597 tailored items of clothing and necessaries.

Changes in Clothing Supplies

A striking feature of clothing supplies in the fifth year of war was the intensity of change and improvement in patterns, designs and modifications of clothing stores. There was a significant change in the character of the load. Demands for hospital clothing, prisoners-of-war clothing and clothing for Chinese troops were decreased, but the ordnance clothing factories met the requirements of the United States Forces in India. An increased quantity and variety of items were supplied to the Royal Air Force, Indian Air Force, Royal Indian Navy and the Uniformed Women's contingents. The battle-dress for the South East Asia and India Commands was produced in olive green and that for Mid East in khaki.

The woollen industry which at one time was being entirely used for war production is now meeting civilian demands as well. Thus the value of army blankets has fallen from Rs. 3 crores in the previous year to Rs. 1,38,56,256. Purchases of silk and jute for war purposes continued to be made during the year.

Chemical Production

With an over 100 per cent. of increase in production since the beginning of the war, the Indian chemical industry has now come into its own. Soda ash, caustic soda, bleaching powder, chromic acid, sodium thiosulphate and calcium chloride are some of the more important chemicals which were not produced or were produced only on a very small scale before the war. A very large number of pharmaceutical and other chemicals are being manufactured which used to be imported in the past.

Cotton Mill Re-equipment

Co-operative Purchase of Machinery in the Post-war Period Suggested

THE following are extracts from the speech delivered by Mr. M. S. Ramchendra Rao, B.A., Chairman and Managing Director, Sri Krishnarajendra Mills, Ltd., Mysore, at the twenty-fourth ordinary general meeting of the company on Saturday the 14th October, 1944. He dwelt at length on the war-time prosperity and post-war problems of the Indian cotton mill industry.

" With the problem of rehabilitating the whole of Europe, with the removal of Japan from the competitive field, with the revival of the huge demand for textile goods from other parts of the world and, above all, with the heavy and continued shortage of cloth in our own country, the Indian cotton mills may expect to be kept continuously busy for a number of years to come. Also, it appears fairly certain that we should reconcile ourselves to the continuance of the present controls even after the war comes to an end ; and it is perhaps just as well that that should be so both from the point of view of the manufacturers as well as in the interests of the consumers, to whom the equitable distribution of the products of the industry is of supreme importance, and that can best be secured only under the present arrangement.

" With the fixation of prices of cloth and yarn at lower levels by the Government, with no corresponding reduction in prices of cotton, with the increase in prices of coal, stores, spare parts and other miscellaneous items resulting in the steady increase in production costs, the cotton mills all over India must be prepared for a decline in their earnings in the coming years. One chief item contributing to the increase in direct costs is the steady rise in the wage bill, which in our case is to-day more than double what it was in the period before the onset of the war. This in itself would be no cause for dissatisfaction, if only the workers, prompted by a spirit of enlightened self-interest and by putting forth better effort, would take full advantage of the opportunities for increased earnings afforded to them and improved their living conditions.

" We have already prepared post-war reconstruction programmes, both near-term and long-term, for revitalizing the existing plant and machinery, as also for replacement of obsolescent plant with modern types. It is apprehended that prices of new machinery after the war are likely to be high by at least 300 per cent. and of spare parts much higher. We estimate that the cost of the present programme, which does not include any scheme of expansion, will be of the order of Rs. 10 lakhs and we have already placed orders for machines and machinery parts of the value of Rs. 2 lakhs. But the scramble for capital goods immediately after the war will be so great and foreign manufacturers, on whom unfortunately this country has to entirely depend for every kind of textile machinery and parts, are likely to impose such onerous conditions in regard to prices and deliveries, that unless some form of co-operative action is taken by the textile industry as a whole, many cotton mills will find it extremely difficult to procure their requirements while the weaker ones among them are sure to be left behind. This aspect of the matter has not been lost sight of by the management.

" Another direction in which such collaboration and combined action on the part of the textile industry are urgently called for, is the manufacturing of textile machinery parts in this country itself. This is, of course, a matter of long-range planning and may take anything from five to ten years to materialize, even if such an enterprise is undertaken in the immediate future. There are excellent possibilities and facilities for such an enterprise in Mysore.

" In disposing of the profits made by the company in the last 3½ years, the directors have been guided by two main considerations. First, the imperative need for conserving the company's resources and strengthening its finances so as to enable us to face the future with confidence. We would have to be prepared for a possible post-war trade slump, though one may hope that such a reverse might be averted or, if inevitable, might not be of long duration. At the same time the need for revitalizing and modernizing the mills' plant and machinery, which are over twenty years old and have been subjected to undue stress and strain in the past few years, is very urgent. All this needs plenty of finance and the reserves of nearly Rs. 19 lakhs which we have now built up should stand us in good stead in meeting this demand.

" Secondly, the directors have attempted to the best of their ability to co-operate with the Government in their anti-inflationary measures by resisting the temptation of high dividends out of what may, generally speaking, be called war-time prosperity and by retaining the bulk of our earnings in and for the benefit of the industry itself. Thus, out of a total profit of Rs. 67 lakhs made during the past 3½ years as much as Rs. 42 lakhs or 62 per cent. have been retained in the industry itself. This has enabled the company not only to become free from all external indebtedness but has added substantially to its fluid resources."

Progress of Cloth Distribution

Permit System at Work

TO ensure equitable distribution of cloth to all parts of the country, the Textile Commissioner, on the advice of the Textile Control Board, decided to introduce a new scheme of distribution of piecegoods from Bombay. The scheme, which came into operation from 1st November, provides that a manufacturer or a merchant of Bombay (possessing a valid Bombay Government dealer's licence) desiring to despatch cloth out of the Bombay surplus area must first of all obtain a permit from the Millowners' Association or the Bombay Cloth Distribution Panel respectively and then register for its despatch with the office of the Textile Commissioner, after duly filling in all the details required. After scrutinizing the permits which contain details about the description of cloth, its quantity, the name and address of the consignee, etc., the Textile Commissioner's office, will advise the manufacturer or merchant concerned about the date and place where the goods should be presented for despatch to its destinations by rail, motor transport or steamer.

As from 1st November no registrations, without such permits for despatch of piecegoods from Bombay to any destination outside the Bombay surplus area as defined in the Cotton Cloth Movements Control Order, are being accepted by the Textile Commissioner.

The introduction in Bombay City of the above system means that every Provincial Textile Commissioner will be advised of the despatch of every bale and to whom it has been despatched. In order to check black-marketing the Textile Commissioner has asked the various Provincial Textile Commissioners, excepting the Provincial Textile Commissioner, Bombay, to requisition from the consignees in the various deficit zones in India such quantities as they deem fit and distribute them to any retailers in these zones at the ex-mill price stamped on the cloth plus 10 per cent.

This action will cause no hardship on any dealer in piecegoods either in Bombay or in any of the deficit zones as all persons despatching these bales have signed a declaration stating that they have not invoiced or charged such bales to the consignees in the deficit zone at a price in excess of the ex-mill price plus 4 per cent.

All dealers in all deficit zones, i.e., in all parts of India outside the Bombay Province, Baroda State, the Western India and Deccan States, are warned that this procedure has been adopted and that they should under no circumstances pay for any cloth consigned to them from Bombay a price in excess of the ex-mill price plus 4 per cent. If they do receive any bales under permit for which they have paid, or if they should be asked to pay more than this, they should immediately inform the Office of the Textile Commissioner who will take appropriate action against the offenders including the cancellation of their Bombay Government Cloth Dealer's Licences.

From the 1st December 1944 no application will be considered by the Bombay Cloth Distribution Panel from any dealer unless an identity card is produced at the time the application is handed in and again when the permits are delivered.

Identity cards will be available for dealers at the Hindustani Native Merchants' Association's Hall, Kalbadevi Road, Bombay, between the 15th and 25th November. All that is necessary to do to obtain one is for the dealer himself or some person holding his power-of-attorney to call at the office between the hours of 11 a.m. and 1 p.m. or 3 p.m. and 5 p.m. with his original Bombay Government Cloth Dealer's Licence on production of which the necessary identity card will be handed to him.

Issue of Permits

Cloth dealers and others concerned are informed that after the Bombay Cloth Distribution Panel has notified that no further permits will be issued for the despatch of goods to any particular deficit zone, no sales of cloth should be made by any merchant in Bombay for destinations in that particular deficit zone. The issue of permits to the following zones was stopped on the dates mentioned against each, says a Press Note from the Textile Commissioner, Bombay :—

Punjab Deficit Zone 16th November ; South Deficit Zone 10th November ; Bengal Deficit Zone 9th November ; Sind Deficit Zone 9th November ; Rajputana Deficit Zone 15th November.

This was done as sufficient permits had been issued by these dates to ensure that these areas obtained their fair share of the piecegoods available. If any dealer continues to sell in November to these deficit zones after the dates mentioned it would merely result in cloth being immobilized unnecessarily and the other deficit areas in India not getting their fair share out of the cloth delivered from the mills during November.

Dealers must also clearly understand, the Press Note adds, that the fact that they may have sold cloth in November with the intention of getting priority for their applications for permits in December or January will not assist them in getting such priority. Dealers should sell during the current and following months only up to the total quantity allotted for any particular zone during that month. The day-to-day position in this regard can be ascertained at the Office of the Bombay Cloth Distribution Panel in the Mulji Jetha Market, Bombay.

CONTROL NEWS AND NOTES

Cloth and Yarn (Control) Order Amended

The Government of India have, by a notification in the *Gazette of India* dated 4th November, amended Clause 14 of the Cotton Cloth and Yarn (Control) Order, 1943. Under the clause as amended it will be an offence for any dealer to buy or sell or have in his possession after 31st December 1944, any cloth or yarn manufactured and packed before 1st January 1944. The clause further lays down that any cloth or yarn, whether manufactured in India or imported, must be finally disposed of within 12 months from the last date of the month marked on the goods; no such cloth or yarn shall be kept in unopened bales after six months from that date.

The Textile Commissioner desires it to be known that no extensions will be given in the time for disposal now laid down unless for the most compelling reasons, and the holder of the goods can show that they could not be sold due to causes entirely beyond his control.

Handloom cloth is exempted from the above provisions.

Samples of Cloth and Yarn

An Order issued by the Textile Commissioner in the *Gazette* on 28th October makes it possible for trade samples of cloth or yarn not exceeding half a pound in weight to be sent by book post with open ends provided that the cloth samples do not exceed 18 inches in length. They may be of the full width of the cloth subject to the above limits.

Prices of Imported Cloth and Yarn

By a notification in the *Gazette* dated 14th October 1944, the Government of India have fixed the maximum wholesale and retail prices of cloth and yarn imported from outside India. No goods so imported can be sold to the consumers, at prices which exceed the landed cost by 32 per cent. in the case of cloth and 26.5 per cent. in the case of yarn. When a consignment of goods has arrived or is about to arrive, the importer should apply to the textile authority of the Province in which the port of arrival is situated along with samples of the goods and relevant documents to determine the landed cost, which will include the price charged by the exporter at origin, freight, marine and war risk insurance, transit charges at the port of entry and customs duty. In case of disparity between this figure and the ceiling price for similar goods of Indian manufacture, the Provincial authority is empowered to fix the landed cost at such higher or lower figure as may appear to him fair. A fee equal to one half per cent. of the landed cost shall be levied before a certificate is issued. The importer may not charge more than 10 per cent. over landed cost in respect of sales of cloth or yarn to a dealer. A dealer may not charge more than 20 per cent. over the importer's price in respect of cloth or 15 per cent. over the importer's price in respect of yarn. Where the importer sells direct to a consumer he may not charge prices higher than that permitted to a dealer.

The importer will have to undertake the responsibility of getting the goods printed with TCB and other specified markings. These markings should be made within a specified period after the landing and under the supervision of an officer authorized by the Controller. An importer should not unpack a bale or a case without the permission of the Controller and when it is done, it should be in the presence of such officer.

Cotton Hosiery

The cotton hosiery industry in India has been adversely affected by an increasing shortage in the supplies of hosiery needles. In many places hosiery machines are stopped solely through absence of needles. Government is anxious that, as far as possible, hosiery production be restored to its former level and information is now being collected relative to the existing hosiery machines and the types and quantities of needles which are required for the machines.

The Government of India have, by a notification in the *Gazette*, directed that all persons possessing such machines should furnish details about the types and makes of such machines in use, the needles used by them, along with their productive capacity to the Textile Commissioner to the Government of India, Bombay.

Marine War Risk on Cotton Piecegoods

In order to facilitate movement, the Government of India have agreed to cover marine war risk on cotton piecegoods and yarn transported by sea from Bombay to Calcutta during the month of November to an extent of 25,000 bales only. Terms and conditions are the same as those which were operative before this concession was withdrawn as from 1st May 1944, i.e., war risk shall be as defined in the War Risks (Goods) Insurance Ordinance and the rules framed thereunder and shall be covered without charge while such goods are in transit on the sea provided that consignments have been insured prior to despatch by sea against marine risk with a registered insurance company or underwriter at the cost of the consignor or consignee as the case may be.

The Government of India's liability shall, in such cases, be limited to a sum which, in no case, shall exceed the sum insured under the marine policy. In respect of damage due to war risks, compensation will be paid by the Government in accordance with the War Risks (Goods) Insurance Ordinance. The Government of India will carry the war risks if the Textile Commissioner, Department of Industries and Civil Supplies, Hararwalla Building, Wittet Road, Ballard Estate, Bombay, has received a duly authorized copy of the marine insurance policy or a certificate issued by a registered insurance company or underwriter before shipment. Shippers must see that such a copy is despatched to the Textile Commissioner prior to shipment.

If a case arises where loss due to war risk has occurred before receipt by the Textile Commissioner of the authorized copy of a marine insurance policy or certificate, the shipper must prove that such a copy was despatched to Government before shipment before any claim can be considered. Under no circumstances will Government consider a claim where the shipper, consignor or consignee has not effected at his own cost marine insurance with a registered insurance company prior to the despatch by sea of the consignment concerned.

Control of Cloth and Yarn in the U.P.

It is learnt that the U. P. Government is considering the question of appointing a Textile Commissioner for United Provinces to regulate the working of the U. P. Cloth and Yarn Control Order and to deal with various problems affecting this trade and industry. The Provincial Government has viewed with concern the black marketing rampant in this province and continued attempts by manufacturers and dealers to evade the provisions of Cloth and Yarn Control Order.

Retail Price of Yarn : Textile Commissioner's Note

In reply to an inquiry as to the class of customers to whom yarn is to be sold at the maximum retail price, Mr. Ramnarayan Chellaram, President of the Bangalore Piecegoods Merchants' Association, has received the following communication from the Textile Commissioner, Bombay:—

"Regarding profit margins for sale of yarn, I have to say that the intention clearly is that the maximum margin of 15 per cent. should apply in cases where it is necessary in order for yarn to reach the ultimate consumer to pass through a number of hands. In such cases, it would normally be expected that the quantities bought by such customer would be small and in the nature of a retail sale. In case of powerloom factories and other organizations buying supplies in bulk, it is equally clear that they should be able to buy nearer the source of supply and at a margin not exceeding 3 per cent. and 7½ per cent. depending on the place of sale. The whole problem is under examination with a view to further clarification. Meanwhile, sales to consumers will be governed by the broad principles enunciated above."

East African Cotton Deal Falls Through

A conference was held in New Delhi on 20th October 1944, to discuss price and other details relating to the supply of the next season's East African cotton to Indian mills. A similar conference was held last year for the last season's cotton crop. Delegates from East Africa who attended the conference are Messrs. Clay, Parker and Colwings. Seth Kasturbhai Lalbhai, Mr. Krishnaraj Thackersey and Mr. Saraiya attended on behalf of the Indian cotton textile industry. Mr. Ramachandra, Acting Secretary, Commerce Department, and other officers represented the department. The latest conference was reported, however, to have ended in failure, as no agreement could be reached, thanks to the attitude of the East African delegation in regard to prices. It is stated that the African delegation proposed that India should buy 300,000 bales of cotton from East Africa and Sudan at Rs. 972 per candy. When the Indian delegates objected to this price on the ground that it was very high, the delegation was prepared to reduce it only to Rs. 900 and no further. The Indian delegation which first offered Rs. 792 is reported to have agreed to pay upto Rs. 800 and no more. This naturally led to a deadlock and the conference broke up without reaching any agreement.

While the African delegation is reported to have taken its stand on the ground that India purchased last year about 280,000 bales at the same price as was being demanded by it, the Indian delegation pointed out that the past year's deal was entered into by the Government of India without much scrutiny and that it was not fair to the Indian consumer to pay such an unreasonably high price. It was also pointed out to the African delegation that as East Africa received about 130 million yards of cotton goods from India, it would be in the interest of that country itself to supply cotton to Indian mills at reasonable prices. The Indian delegation was also constrained to remark that, should East Africa and Sudan be unwilling to supply cotton to India on fair terms, it would be obliged to curtail exports of textiles to them. None of these arguments seem to have moved the East African delegation. And there the matter now rests. The Government of India is reported to be examining it in the light of the discussions between the two delegations and may refer the matter to H.M. Government, with a request to persuade the Colonial Governments to supply cotton at reasonable prices, before deciding to withdraw the facilities in regard to exports of cotton goods which are allowed on the principle of reciprocity.

The stand taken by the African delegation seems to be quite unfair, remarks *Commerce*, and lacking in appreciation of the steps voluntarily taken by the Indian Government and the cotton mill industry to supply cloth to East Africans and others in the Middle East at reasonable prices. It is, indeed, a pity that the Government, before agreeing to supply cloth to that country, did not fix up a firm reciprocal arrangement for the supply of cotton by it to India.

OUR PERSONAL COLUMN

Mr. K. C. Mahindra, I.C.S., Chairman of the Indian Supply Mission in Washington, who had been invited by the Government of India to return to this country for consultation, was in Bombay to meet the Supply Member, Sir Ramaswami Mudaliar.

Mr. J. M. B. Gibbons has been elected to serve as the representative of the Bombay Chamber of Commerce in the Council of State in the vacancy caused by the acceptance of office in the service of the Crown in India by Mr. R. H. Parker. Mr. Gibbons was a former President of the Chamber.

The General Council of the All-India Trade Union Congress, at a meeting held at New Delhi, appointed **Mr. R. A. Khedgikar** and **Mr. Sudhindra Pramanik** to represent it at the World Trade Union Congress in London in January, 1945. They are in addition to Mr. S. A. Dange, already in Britain.

Dr. J. M. Kumarappa, M.A., S.T.B., Ph.D., Director and Professor of Social Economy at the Tata Institute of Social Sciences, Bombay, has been invited by the American State Department to be its guest during a tour of the United States. Dr. Kumarappa, who is the first Indian to be invited under the U.S. State Department's new programme of international and cultural co-operation, will leave India in the first week of December.

During his stay of five months in the United States, Dr. Kumarappa proposes to explore the scope of assistance he could get to work out the scheme formulated by him for the post-war expansion of the Tata Institute of Social Sciences and which was approved by the trustees of the Institute.

Dr. Kumarappa informed the representatives of the Press that his planned itinerary would begin with New York, taking him across the continent to California and the Middle West States, during which he proposed to visit the various institutions in the United States, where he said, teaching of applied social sciences was far more advanced than in most of the European countries. The institutions include those for the mentally deficient, for crippled children, for the deaf and dumb, courts for juveniles and domestic relations cases, modern institutions for the correction of juvenile delinquents, women and girls and advanced prison farms where "trustees" are on their honour bound not to escape.

The Government of India has invited the following Indian industrialists and business men to visit England and America, as soon as war exigencies permit, with the object of studying the present industrial organization of these countries, the technical advances made by them during the last few years, and their post-war industrial plans:

Messrs. J. R. D. Tata, G. D. Birla, Nalini Ranjan Sarker, Sir Padampat Singhania, Mr. Krishnaraj Thackersey, Seth Kasturbhai Lalbhai, Sir Sultan Chinoy, Mr. M. A. Ispahani, Mir Laik Ali, and Mr. A. D. Shroff.

The Executive Committee of the Andhra Chamber of Commerce, at a meeting held in Madras on 2nd October, have elected the following members to form a Post-war Reconstruction Committee: Messrs. C. Seshachalam, T. V. Ethirajulu Chetti, B. Ramachandra Reddi, G. D. Naidu, Chunduri Venkata Reddi, Puram Prakasa Rao, Vupputuri Venkata Punniah, M.L.C., B. D. V. Ramaswami and Appa Rao.

Mr. Jamnadas M. Mehta, M.A., LL.B. labour leader and a member of the Central Legislative Assembly, has been appointed the first representative of the Government of India in Burma. His headquarters will, for the present, be with the Government of Burma at Simla.

Mr. Mehta has no intention of resigning his seat on the Central Legislative Assembly at present, although he will have to relinquish his leadership of the labour movement. He is also a member of the Bombay Municipal Corporation. He was Mayor of Bombay for a year.

Mr. Mehta was a member of the Congress Party for over ten years. He was Finance and Revenue Member of the Government of Bombay for three months and a half, immediately after the introduction of the Reform under the Act of 1935. He represented Indian labour at the recent

International Labour Conference at Philadelphia.

Mr. Jamnadas Mehta has now resigned the presidentship of the Indian Federation of Labour.

Sir Chunilal B. Mehta, Kt. the well-known business man of Bombay, is the leader of the delegation of Indian business men, who attended the World Business Conference held in the U.S.A. in the middle of November. The other members of the delegation are: Mr. G. L. Mehta, Calcutta (Deputy Leader); Mr. Satya Paul Virmani, Amritsar, Mr. A. R. Siddique, Calcutta, Mr. J. C. Mahendra and Mr. David S. Erulkar. The delegates were assisted by Dr. P. S. Lokanathan, Editor, the *Eastern Economist*, New Delhi; Mr. M. A. Fazalbhoy and Dr. Jariwala of Bombay, and Mr. V. M. Bhatt, Assistant Secretary, Federation of Indian Chambers of Commerce and Industry, Delhi.

Mr. H. R. Gollan, the Australian Government Trade Commissioner in India, who is also Australian Member of the Eastern Group Supply Council, has left India for Australia for consultation with the Australian Government on matters relating to post-war trade and the development of reciprocal commercial relations between India and Australia.

While in Australia Mr. Gollan will have the opportunity of viewing the immense developments which have taken place in Australia's industrialization during the past few years. He will indicate to Australian manufacturers commercial outlets for their products in India, Burma and Ceylon, and advantage will also be taken, during this visit, to confer with chambers of commerce and manufacturers along these lines. The benefits which would accrue to all concerned as a result of two-way reciprocal trade will not be overlooked and interviews will be undertaken with Australian clients of Indian exporters to that end.

Prof. A. V. Hill, the British scientist, and Secretary to the Royal Society, who was recently in India on a five-month visit to this country, has been awarded the Medal of the Society of the Chemical Industry, London.

Sir Harry Railing, Chairman and Joint Managing Director of the General Electric Co., Ltd., has been elected President of the Institute of Electrical Engineers, England, for the year 1944-45.

He has been with the firm since 1905 and before joining them as chief of the test department at Witton, he had had some years of practical experience in works practice and management in the United States and on the Continent. In 1907 he went to the company's head office as technical assistant to the late Lord Hirst. Four years later he was elected to the board and at the same time appointed General Manager of the Witton group of works. He retained this position when he returned to Magnet House in 1933 to take over further administrative duties and he became Joint Manager in 1941. Upon the death of Mr. M. J. Railing in the following year he was appointed Vice-Chairman of the company and he succeeded Lord Hirst as Chairman and Joint Managing Director (with Mr. Leslie Gamage) in February last year.

Sir Harry Railing is also Chairman of the B.E.A.M.A. Council for the current year and he is a member of the Management Board of the Engineering Employers' Federation. He had previously served as Vice-President of the Institution for two years.

Cotton and Rayon Merchants' Association, Manchester.—At a recent meeting of the Executive Committee of the Grey Cloth Section of the Cotton and Rayon Merchants' Association, Mr. C. G. Hargreaves was re-elected Chairman of the section, and Mr. H. Crabtree, Deputy Chairman for the year 1944-45.

At a meeting of the Executive Committee of the Cotton Converters Section held on 21st August, Mr. H. Prince Bardsley was unanimously re-elected Chairman of the section for the year 1944-45. The full Committee is constituted as follows:—Messrs. H. Prince Bardsley, F. H. Beckett, S. Beddow, E. A. Carpenter, S. P. Dixon, H. Foster, F. Grundy, J.P., G. O. Mackenzie (Jun.), C. R. Johnson, A. H. Rains, and W. Speak.

Mill Staff News

Mr. H. J. Grindrod, formerly Manager of the New China Mills, has now taken up his former post of Carding and Spinning

Superintendent in the Madhusudan Mills, Ltd., Bombay.

Mr. V. H. Mehta, B.A., who was the General Manager of the Kalyanmal Mills, Ltd., Indore, in 1942, has now joined the Gendalal Mills, Ltd., Jalgaon, as General Manager. He has served for several years in different mills in Bombay and Ahmedabad as Manager and has specialized in cotton selection, etc., during his stay in Uganda and British East Africa where he was working for three years.

Mr. Nariman P. Munshi has left the Juggilal Kamlapat Mill of Cawnpore and joined the Lakshmi Ratan Cotton Mills, Ltd., Cawnpore, as Sizing Master.

Mr. S. R. Roy, A.G.W.I., is confirmed as Weaving Master in the Jam Manufacturing Co., Ltd., Bombay. He is a first class first diploma holder of the Bengal Textile Institute and also first class certificate holder of London City and Guilds in both cotton spinning and cotton weaving. He has worked in different capacities in the Rohit, New Cotton and Asarwa Mills, Ahmedabad, and the Shree Ram Mill, Bombay.

Obituary

Mr. William Wilkinson, O.B.E., F.T.I., Principal of Blackburn Municipal Technical College, and a leading authority on the textile industry in general and weaving in particular, passed away on 16th September. He was 62 years of age, and had been head of the College since 1925. In May 1943 he took the honorary appointment of technical officer in the Cotton Board's Recruitment and Training Department.

Mr. Sagarmall Mody, a leading yarn merchant, died in Jodhpur on 23rd October 1944. Trading in yarn, conducted under the auspices of the Yarn Merchants' Association, Bombay, of which he was the former President, was suspended for a day as mark of respect to his memory.

Mr. Amritlal L. Ojha

We regret to record the death of Mr. Amritlal L. Ojha at Calcutta on 18th October 1944. He was a leading business man of that city and a former President of the Federation of Indian Chambers of Commerce and Industries.

He was an elected member of the Bihar Legislative Council, President of the Bengal National Chamber of Commerce in 1928, President of the Indian Chamber of Commerce, Calcutta in 1933-34 and President of the Bihar and Orissa Industrial Conference in 1931.

He was keenly interested in labour problems, and has travelled widely in Europe. In 1930 he attended the International Labour Conference at Geneva as an Employers' delegate from India.

Mr. Ojha was also a former President of the Indian Chamber of Commerce, Indian Mining Federation, and the Colliery Owners' Association.

The Late Mr. Cawasji D. Panday

Portrait Unveiled at Bombay Textile and Engineering Association

A PORTRAIT of the late Mr. Cawasji D. Panday was unveiled on Tuesday the 31st October 1944 by Sir Homi Mehta, K.B.E., at the Bombay Textile and Engineering Association, Bombay. A large gathering was present.

Mr. D. N. Pavri, President of the Association, gave a brief account of the work done by the late Mr. Panday for the textile industry in general and the Textile Association in particular. He said that Mr. Panday had expressed a keen desire to be personally present at that function a fortnight before his death.

Mr. Pavri then requested Sir Homi M. Mehta to unveil the portrait.

Sir Homi Mehta narrated how he was connected with the late Mr. Cawasji D. Panday from his early days when he was only about 11 or 12 years old. His father was associated with Mr. Cawasji Panday and his father-in-law, Mr. Umrigar, was even a closer friend of Mr. Panday. Mr. Panday used to visit their house and, therefore, Sir Homi had opportunities of knowing him from his early childhood.

He then spoke about the services rendered by the late Mr. Panday to the mill and cotton industry. He said that Mr. Panday had, by dint of hard work and perseverance, risen from the rank of apprentice to the post of Manager, from which post he retired in 1906. Even after retirement, he wholly devoted his attention to the cause of those who worked in mills. In his retirement he visited Europe and, while there, he paid a special visit to Manchester to study its cotton manufacturing industry. When he returned to India, he did not take up service but, remaining a free man, gave the benefit of his advice and experience to many millowners in Bombay and elsewhere. The House of Thackersey was one of the first contacts of the late Mr. Panday and Sir Vithaldas Thackersey often took advice from him. Later on, Sir Homi said, the House of Petit requested Mr. Panday to

Photo: Eos Studios, Bombay

Group Photo taken on the occasion of the Unveiling Ceremony: Sir Homi Mehta, K.B.E., is seated in the middle.

Sitting from left to right:—Mr. G. N. Vaidya (Ruby Mills); Rao Sahib C. J. Soneji (E. D. Sassoon & Co.); Messrs. L. V. Patel (Madhowji Mills); H. F. Bamji (Dawn Mills); D. N. Pavri (Madhusudan Mills); Sir Homi Mehta, K.B.E.; Messrs. N. V. Modak, City Engineer, Bombay Municipality; Nariman F. Bharucha (Pralhad Mills); B. B. Joshi (Textile Directorate); Nandulal M. Mehta (Morarjee Goculdas Mills); Sohrab K. Khan (Textile Directorate).

join the Petit group of mills. Mr. Panday joined as superintendent of five or six mills of the Petit group in 1911. When the Great War broke out in 1914 the mill industry began to make huge profits, and Mr. Panday helped the management of the Petit group in the best way with his expert knowledge of the industry. He retired in 1927 as he was not, owing to advanced age, able to continue to shoulder the responsibilities of such a big group of mills. But, as Sir Homi said, during the time that Mr. Panday was connected with the House of Petit, the Petit group passed through its most prosperous times.

Mr. Panday, Sir Homi remarked, was active even in his retired life. He did not possess much wealth, yet, with great foresight he gave a handsome amount, the object of which was to promote the welfare of the mill workers as well as the interests of the industry.

In conclusion, Sir Homi said that Mr. Panday had done everything possible that an individual could do. He had devoted his life to the cotton and textile industry and he felt sure that his name will remain amongst the mill workers and millowners as long as the industry lives.

Sir Homi Mehta then unveiled the portrait.

Mr. B. B. Joshi and Rao Saheb C. J. Soneji, who proposed a vote of thanks to the chair, also spoke a few words about the late Mr. Panday.

Messages from some of the Life Members of the Association, viz., Sir Frederick Stones, Mr. Fakirji E. Bharucha and Mr. Neville Wadia were read at the meeting by Mr. H. F. Bamji, Honorary Secretary of the Association.

Institute of Textile Technology

Travancore University

MR. K. Kylas has been confirmed as Professor of Textile Technology in the Institute of Textile Technology, University of Travancore, Trivandrum. He holds the rank of a captain in the University Officers' Training Corps, and in view of his previous military experience, he has been made the Adjutant of the Corps.

Erection of a Spinning Plant

Thanks to the efforts of Mr. M. P. G. Nair, T.T.W.Fm. (Saxony), Spin. Tech. (Bohemia), the Principal, the institute was able to complete the erection of a newly purchased spinning plant which has started working.

Cotton Culture Research

Mr. M. P. G. Nair, in close collaboration with Messrs. K. Kylas, G. S. Ramakrishnen, and K. M. Mathew, has started the experimental cultivation of different varieties of cotton under ordinary conditions, to see the suitability of S. Travancore soil and climatic condition for cotton cultivation.

The Dean of the Faculty of Technology, Dr. D. L. Deshpande, has taken a very keen interest in this branch of technological studies, and the research section is indebted to him for this. The first bed of cotton plantation was sown by him.

Indigenous Dyes

Work is in progress on the utility of indigenous dyes of Travancore by Messrs. K. Kylas and T. V. Punnoose and an assay of their tinctorial values is also in progress.

Textile Technological Association

Dr. K. L. Moudgill, M.A. (Cantab.), D.Sc. (Glas.), F.I.C., delivered the inaugural address of the above association on " Research on Everyday Applied Science." Mr. M. P. G. Nair, T.T.W.Fm. (Sax.), Spin. Tech. (Bohem.), presided.

The Staff Club

Dr. D. L. Deshpande, Dean of the Faculty of Technology, Travancore University, has been unanimously elected as an honorary member of the club.

Commercial and Technical Organizations

The Millowners' Association, Bombay

Joint Examination Board in Chemical Engineering.—The Association has appointed Sir Sri Ram, Kt., as its representative on the Joint Examination Board in Chemical Engineering and Technology of the Association of Principals of Technical Institutions (India).

Textile Trade Marks Advisory Committee.—Mr. Dharamsey Mulraj Khatau, Mr. T. V. Baddeley and Mr. A. Pether have been appointed as the Association's representatives on the Committee for a further term of two years.

Holidays with Pay for Workers.—Towards the end of March, the Hon'ble Dr. B. R. Ambedkar introduced in the Legislative Assembly a Bill to further amend the Factories Act, 1944.

Briefly stated the amendment sought to: (*a*) provide for the grant of compensating holidays against the loss by worker of his weekly holidays as a result of any order or rule made under the Factories Act ; (*b*) confer on workers in perennial factories the benefit after a year's service, of at least seven consecutive holidays of which at least six would be paid for.

On the general question of granting to industrial workers annual holidays with pay, the Association felt that, while holidays with pay would increase the cost of production, there would be no corresponding benefit to the workers, who, it was thought, would take, as they always did, long holidays during the year to go to their villages, and therefore, the need for a paid holiday to provide for a certain period of absolute rest had not been made out.

Moreover, it was only in February 1944 that Government appointed a Committee to collect data on various labour matters, the intention being that on receipt of the required statistics, Government should appoint a Mixed Committee to formulate plans of social security. The Rege Committee had not yet completed their work, and the Committee of the Association expected that no measure of social security would be launched by Government until the Rege Committee had reported and until the Mixed Committee proposed by Government had gone into the whole question and submitted their recommendations.

Clause 1, sub-clause (2) provided that the measure shall come into force in a Province on such date as the provincial Government may notify. The Association did not understand why option in this matter should have been left to provincial Governments. It was of the utmost importance that there should be uniformity in this respect.

Proposed section 35(A) (2) empowered provincial Governments to make rules prescribing the manner in which compensatory holidays should be allowed. It was suggested in this connection that suitable instructions should be sent to provincial Governments to ensure that, before framing rules in this regard, the circumstances obtaining in individual factories or group of factories were taken into consideration.

Proposed section 49B laid down that holidays for a period of *at least* seven consecutive days should be allowed. The Association pointed out that it should be clearly understood that the period referred to was the maximum and not the minimum, and the words "at least" should be deleted. If this amendment were not made, it was quite conceivable that some provincial Governments might make it obligatory to grant more than seven days.

The expression "lock-out" used in the proposed clause was somewhat nebulous. Lock-out might follow an illegal strike, and it was necessary that it should be clearly laid down that if the closure of the factory was due to the illegal strike of the operatives, that should be regarded as a break of service.

It was also pointed out that the section did not describe the position of women workers on maternity leave, but it was presumed that women on maternity leave would not lose their right to annual leave.

Another point which the proposed Bill did not make it clear was the exact date on which leave with pay should commence. This was a very important matter and unless it was made clear that employers had the right to grant leave after consulting the exigencies of the factory, most of the employees would be asking for their annual leave during particular seasons of the year to the detriment of production in the factory.

The Bill did not contain any specific provision prohibiting a worker to accept any remunerative work when on a paid holiday, and it was pointed out that this defect should be remedied, as the object of the legislation might be defeated if the worker was free to accept other employment.

Formation of an All-India Handloom Board.—The Government of India appeared to hold the view that an All-India Handloom Board would serve a very useful purpose, and that its functions might include :—(*a*) Recommendations to the Government of India as to what proportions of the yarn available from Indian production should be supplied to each province and State interested in obtaining yarn for handloom weaving ; (*b*) assistance to handloom weavers through recognized associations or provincial or State authorities in obtaining dyes, chemicals and stores, etc., at fair rates ; (*c*) consideration of the best means of marketing Indian handloom products ; (*d*) directing research measures. This would be, in the main, organizing market rather than laboratory researches, and in this regard the Board would no doubt make use of the organizations already in existence in the several provinces and States. Consideration of measures to improve production would fall naturally within the Board's purview ; (*e*) the board would assist in the administration of the grant-in-aid from the Government of India.

As regards the constitution of the Board, the Government of India had made the following tentative suggestions :—Representatives of the provincial Governments and handloom industry, 15 ; representatives of States, 4 ; representatives of millowning interests and of the yarn trade (to be nominated by the Textile Control Board) 6, total 25.

The Government of India considered it highly desirable that closest contact should be maintained between the proposed Board and the Textile Control Board, and for this reason, suggested that the Textile Commissioner might be appointed Chairman of the proposed Handloom Board.

The proposal for the establishment of an All-India Handloom Board on the lines suggested by Government seemed to have emanated from the Fact Finding Committee (Handlooms and Mills) which was set up by Government early in 1941. At the twelfth session of the Industries Conference at which Government decided to appoint a Fact Finding Committee, the Honourable the Commerce Member who presided, assured the representatives of the industries present that the report of the Fact Finding Committee would be placed before the Conference again before further action was taken. On the other hand, neither the Government of India nor the provincial Governments appear to have considered the recommendations made in the report and formulated their decisions thereon ; it would appear that some time after the publication of the Fact Finding Committee's Report, a special officer was appointed by Government to report on the findings of the Fact Finding Committee. The suggestions of this special officer were considered by the representatives of Provincial Governments and States and the Handloom Committee of the Textile Control Board at Madras, and some of the recommendations of this conference had already been implemented as, for instance, reduction in the price of yarn. But the special officer's report did not seem to have been made available to any commercial organization in the country. In view of the undertaking given by the Honourable the Commerce Member immediately before the Fact Finding Committee was appointed, the procedure followed by Government in dealing with the Fact Finding Committee's report was unfair to the Indian cotton textile industry.

The position taken up by the Association was that the Fact Finding Committee, as the name suggested, was primarily concerned with the collection of facts. What Government now sought to do was to accept these facts as correct and give effect to the recommendations which, according to the Fact Finding Committee themselves, were in the nature of peace-time measures only. The establishment of an All-India Handloom Board, constituted as suggested by Government, and with the comprehensive terms of reference proposed, was calculated to result in recommendations, having as their background the present abnormal conditions created by the war.

The Association agreed that all reasonable assistance should be given to the handloom weaver to obtain his *bona fide* requirements of yarn at reasonable prices ; they further agreed that he should, if necessary, be given all possible assistance in marketing his cloth ; what they, however, emphasized was that the supply of yarn should be looked after by the existing Provincial Government organizations with the assistance of the Textile Commissioner, and as a matter of fact this procedure already seemed to have been followed in certain Provinces.

The problem of marketing did not afford any difficulty at present, and the handloom cloth which was not subject to any control as regards maximum prices was being sold more freely and at higher rate than Indian mill-made cloth. The Association, therefore, did not see any reason for the undue haste with which Government were seeking to give effect to the recommendations of the Fact Finding Committee without even consulting the interests concerned. The Textile Control Board with its appropriate sub-committees seemed to be competent to tackle the requirements of the handloom weaver in the matter of yarn, and the Committee emphasized that this arrangement should continue for the duration of the war, and that in the meantime Government should formulate their own conclusions with regard to the findings of the Fact Finding Committee and place them before the interests concerned for consideration.

The Handloom Committee of the Textile Control Board, on 12th October 1944, passed the following resolution by a majority :—"The Committee having considered the replies from provincial and State Governments is of the opinion that the Government of India should take early steps for the formation of an All-India Handloom Board on lines similar to those of the Textile Control Board."

The above resolution, it is understood, stands adjourned till the next meeting of the Textile Control Board.

Textile Stores and Machinery Merchants' Association, Bombay

Second Quarterly Meeting.—The second quarterly general meeting of the Textile Stores and Machinery Merchants' Association, Bombay, was held early last month with Mr. R. M. Nanavati, President, in the chair.

During the 2nd quarter the membership increased from 114 to 123, and the following matters were considered by the Committee: Bombay explosions ; appointment of sub-committees for different branches of the trade ; grant of general and particular import licences ; and imports of cotton ropes, bandings and spindle tapes and the claims of indigenous manufacturers for protection and encouragement.

The report mentions that the question of grant of general and particular licences was taken up with the Government of India, who informed them that the position in which importers, who in peace-time dealt not with U.K. but with countries which are now enemy countries, now find themselves, is merely a manifestation of ordinary commercial hazard. They exercised their judgment in a certain direction, their judgment had been proved to be faulty and as a result of the misjudgment they now inevitably find themselves at a disadvantage in comparison to their competitors. The Government did not agree that it would be fair and reasonable for Government to repair the effects of the mistaken judgment of such importers by introducing them by main force, as it were, into import channels already established.

The report further mentions that even though the Committee had submitted to the Textile Commissioner complete statistics regarding production and sales of cotton ropes and bandings and spindle tapes, he had turned down the request for stopping the imports of those materials.

The President, Mr. R. M. Nanavati, proposing the adoption of the report, observed as follows.

Referring to the post-war planning, Mr. Nanavati said :

"Both the U.K. and U.S.A. have kept plans ready to shift war-time industries into peace-time industries, for supplying civilian requirements of the world. Their idea is to ensure employment at home and capture foreign markets, and to absorb surplus stores that will be made by their expanded industries. The question is, are we free to plan for post-war large-scale industrialisation in the same manner? Mr. Dalton, President of the British Board of Trade, recently issued a five-point programme for the rehabilitation of the textile industry in Lancashire, suggesting amalgamation in spinning equipment, overhauling mercantile organization, extending double shift working and simplifying and modifying wage structure. The aim is to avoid the danger of the continuation of the pre-war shrinkage of output, exports, and employment, which would be a disaster to Britain.

"It is generally known that by double and treble shift working, our industry will get exhausted during the next few years, and will require replacements. It is estimated that our textile industry will have to replace 10 million spindles and 200,000 looms within 5 to 10 years after the war; for this the British textile mechanists will have to accommodate us, unless we have in the meantime made arrangements to have the necessary machinery made in India. Is it not possible to secure certain rights on royalty basis from the manufacturers in the U.K. to enable us to manufacture essential machinery in India, during the first five years of the post-war period. It has been whispered that part of the sterling balances may be liquidated by supplying old or reconditioned textile machinery and by supplying textiles produced by Lancashire, if any surplus is available. Both these factors may affect adversely the interest of our textile industry, and following after the present boom time, a very critical situation may have to be faced. We must not forget that our trade largely depends upon the prosperity of the textile industry.

"During the period of war, we have also started manufacturing certain parts of machinery and auxiliaries. We have made reconditioned spindles required by the textile industry. It is unfortunate that Government have recently instituted an order to the effect that only six firms are exclusively entitled to import and distribute spindles from U.K. manufacturers. They have done this on the pretext of preventing thefts of spindles being committed in the mills. This sounds very strange as in order to help the millowners, they have ignored the interests of Indian merchants and manufacturers, and have canalised the import trade in the hands of those six firms.

"There are about 500 merchants in the trade relating to this Association, of which only about 40 were issued licences as registered importers, and the rest were precluded from doing *inter se* trade or even agency business, in all the important controlled articles of mill stores. Already the majority of the merchants are wasting their time and eating up the profits that had accrued in the war period. Competition in the post-war period will be so keen that there would be no place left for middlemen. War-time machinery has been so organized as to bring producer and consumer together. The members of the Association should join together into a syndicate and start manufacturing mill stores and machinery, raising their own capital, bringing necessary technical aid from abroad, and utilising all their past experience.

"If we remain idle big business and foreign interests will take control of post-war industrialization. We should devise such means and methods as to make our existence safe in the post-war period. It is up to us to unite and create a central organization to produce and distribute mill stores and machinery."

The Vice-President, Mr. G. A. Kulkarni, seconding the adoption of the report, delivered the following speech :—

Import Trade in Future

"I will particularly lay emphasis on the important issue of import trade in general, which is more or less the mainstay of our business. As a whole the millstores trade is of appreciable size and most of the items included in this trade are imported. Most of us, being engaged in the import of various articles of millstores, have naturally to depend upon supplies from abroad and particularly from the U.K. There are very few items connected with our trade which are made or manufactured by indigenous industry. The situation, therefore, is this that if the pre-war conditions of free trade do not return and we are not able to obtain in sufficient quantities imported materials to trade with, we will naturally be reduced to great straits. Indications are not wanting that after the war the import trade will be controlled by foreign interests who will have their own distribution arrangements. There would be every endeavour to form powerful combinations, mergers, cartels, etc., and thus eliminate middlemen like us. Some of you may think that after war the U.K. is not the only source from which one can obtain his trade requirements but there also we may be disillusioned in our hopes and aspirations, as trade from countries of the continent of Europe may pass through U.K.—London being made the centre of distribution. To meet the perilous situation which may arise, the only remedy to my mind is to develop on scientific and well-organized basis whatever industry we may be able to build and to develop it irrespective of its size. Only thus may we be able to avoid to some extent at least the situation we found ourselves in during this and the last war.

"The two great wars, one of 1914 and the other which is being fought now, have made very little difference so far as industrial development, and with it the economic improvement of our country, is concerned. For all purposes we have to depend upon imports of all consumer or capital goods or both and we can hardly content ourselves with the situation decade after decade.

As a result of war activities we have seen the birth of some industries here and there and it is a question agitating our minds how many of these newly started industries will survive and how long, having regard to the attitude of the present Government. These industries are suffering from several handicaps such as want of technical assistance and guidance, appropriate equipment, scientific organization and so on. These being not available, only active sympathy of the Government will enable them to tide over their post-war difficulties.

"Only 73 firms have been given general import licences ; of these 27 are European firms and 46 Indian firms, while the actual position is that there are about 400 to 500 firms engaged in millstores trade and all these firms will have to look to their trade requirements to those firms who hold general import licences and if they are unable to secure adequate supplies, one has to imagine their plight in the trade.

"The policy adumbrated by the Textile Directorate in its Priority Note is all right. But, not only have no actual steps been taken to implement that policy but also the action taken under it is calculated to harm some of the small industries in our trade which have been flourishing with more or less success.

"The industry of cotton ropes, banding and spindle tape, etc., is capable of producing all the requirements of the textile industry in India. In spite of this imports in these items in huge quantities are encouraged, to the disadvantage of the industry, on the ground that the quality standard maintained by the industry is not of the same high level as maintained by makers abroad though it is said to have given satisfaction to the mills. The position of nearly 400 bobbin factories which came into existence during the war, makes very sad reading.

"Another point to which I should draw your attention is the possibility of our being forced to confine ourselves to certain limited markets. There is, it appears, a conflict of interests so far as trade and commerce is concerned between the U.K. and the U.S.A. and I fear certain markets in the world, from which we can secure our requirements of consumer or capital goods more advantageously, may not be available to us. It is worthwhile to give an instance here, i.e., imports of leather belting from U.S.A. After careful consideration a certain quantity of belting was allowed to be imported from the U.S.A. and necessary import licences were being issued. The U.K., however, found that it must maintain the monopoly of the belting trade and took prompt measures to ban imports of U.S.A. belting. On this there was a strong agitation in the U.S.A. as a result of which the Deputy United States Member of the Combined Production and Resources Board made a statement to the effect that India was free to import its belting requirements either from the U.K. or the U.S.A. Although this clarification has come from the U.S.A., there is hardly any clarification from the U.K. and the importers are not getting the necessary import licences to which they are entitled.

Spindle Control

The primary object of the Order under the Defence of India Rules regarding spindles is to check thefts of spindles. To my mind there is already adequate machinery and power which Government can use to check this menace. The dealers in this commodity are put to a lot of hardships and pecuniary loss due to the refusal on the part of the Textile Commissioner to issue necessary release orders for the sale and purchase of the quantities of spindles held in stock by them. This order is working adversely. A representation has been made and the result is awaited. The same is the case with the control order for nicklin tubes.

"On the Millstores and Priority Assistance Committee, the interests of our trade are not properly looked after. This is but natural. One man cannot obviously know the difficulties and problems of all the trades the Millstores and Priority Assistance Committee is called on to adjudicate upon. It is absolutely necessary that our trade must be represented on the Committee."

Officialese

The tongue that Shakespeare spake has thus been treated in an Order signed by an Assistant Secretary of the Board of Trade:—

"A manufacturer of controlled goods who has since the 31st day of July 1940, acquired any controlled goods from a manufacturer of controlled goods by virtue of the provisions of this Order or an Order revoked by this Order permitting the supply thereof to a manufacturer, shall not use those goods otherwise than in the manufacture of controlled goods or supply those goods otherwise than in circumstances in which he would be permitted to supply them if he had carried out a process in the manufacture thereof."

"In everything," as Wordsworth added, "we are sprung of Earth's first blood, have titles manifold." The title of "manufacturer of controlled goods . . . who has acquired any controlled goods from a manufacturer of controlled goods by virtue of an Order" (which may or may not have been revoked) ranks with the more illustrious of these new distinctions. Manufacturers of controlled goods have meanwhile to endeavour to live up to them.—*Mercantile Guardian.*

REVIEWS

An Introduction to Industrial Labour Welfare. By H. P. Oza and V. B. Kotdavala (with a Foreword by Prof. C. N. Vakil). Published by Sandesh Prakashan Mandir, Saraswati Bhuvan, Sarangpur, Ahmedabad. Price : Rs. 6-0-0.

Labour welfare is coming to occupy an increasingly important place in industry and the labour officer has been correspondingly gaining in status in the hierarchy of industrial organization. The book under review is the result of the joint labours of an academic professor and of a practical worker in the field of labour welfare, and attacks the problem of industrial labour welfare from a new angle.

Divided into three parts the book tackles in turn the subjects of the State and labour welfare, the worker in relation to welfare activities and the employer and his relation to labour welfare. The need of Governmental action, the existence of unionism and employer's farsightedness is taken for granted. Each of the three parts is appropriately taken up, first, with a statement of the theory underlying welfare ; secondly, a historical account of developments up to date ; and lastly, suggestions presented to the reader by the authors.

The book should be found a useful introduction to the subject of labour welfare. The inclusion of a chart illustrating the manifold duties of a labour officer only adds to its usefulness.

Investors' Encyclopædia 1944 (with **which is incorporated the Southern India Investor**), Ninth Edition. Compiled by Kothari and Sons, Share, Stock and Exchange Brokers, Armenian Street, George Town, Madras. Price: Rs. 15, post free.

This well-known annual reference book published in the South has now been greatly enlarged and for the first time details of all Indian companies of any importance are included in it. The omission of a few North Indian companies may have to be regretted, but it could not be avoided owing to the operation of the Paper Control (Economy) Order.

In the introductory section are included the rules and regulations of the Madras, Calcutta and Bombay Stock Exchanges; definitions of stock exchange terms, instructions for the guidance of the investor, and useful information for investors. Full particulars are given, among others, of banking and insurance companies, jute and cotton mills, and tea and rubber estates. Under cotton mills, details regarding directors and their qualifications, the managing agents and their remuneration, capital, share transfers, closure of transfer books and voting rights, and dates of closing accounts and paying dividends have been included. In addition, the number of spindles and looms in each mill is given, as well as a tabular analysis of working over a period of three or four years. The book should prove as usual to be a highly valuable reference book alike to the business man, economist and journalist.

NOTICE

Indian Chamber of Commerce, Calcutta: Annual Report for the Year 1942. Bulkier than the annual reports of several other chambers, the report under reference is full and comprehensive. It relates to the year 1942, was printed in 1943 and is released to the press in 1944. Highly valuable as a record of the trends and events of the year to which it relates and the reactions of the Indian mercantile community to them, it will be placed along with the reports of other chambers of commerce in the country.

Causes of High Dewpoint Temperature in Boiler Flue Gases. At a recent joint meeting of the Institution of Mechanical Engineers and the Institute of Electrical Engineers, London, Mr. W. F. Harlow, Wh.Ex., A.M.I.Mech.E., a member of the technical staff of **International Combustion Ltd., Derby, England** (Indian office: **International Combustion (India) Ltd.**, 9, Clive Street, Calcutta), presented for discussion a paper on the causes of high dewpoint temperature in boiler flue gases, which may be of interest to our readers, particularly regarding the sulphur content of Indian coals and subsequent troubles in the flue gas passes.

High dewpoint temperature in flue gases in boiler plants causes premature condensation in the cooler gas passages resulting in deposits and corrosion. Evidence is submitted to show, in the course of the paper referred to above, that high dewpoint can be caused by the increased temperature of the super-heater tubes, the oxide film catalysing the conversion of the sulphur dioxide formed by combustion into sulphur trioxide thereby increasing the sulphuric acid content of the gases. The trouble is confined mainly to plants fired by mechanical stokers, pulverized fuel plants generally being unaffected. Coating the catalytic surfaces with lime or fine pulverized fuel ash prevents the action and it is suggested that these materials sprayed on the tubes at intervals may prevent the formation of acid and its serious consequences.

Journal of Scientific and Industrial Research, Vol. III, No. 3, September 1944. A scientific discussion of the post-war industrial development of India is a feature of the September issue under notice of the *Journal of Scientific and Industrial Research*, just published. The scientific aspects of post-war reconstruction, which demand the attention of the Government and the country at large, include a survey of our material resources, formulation of operative plans for the promotion of basic and subsidiary industries, the nature and scope of co-ordination with foreign countries and the question of priorities, technical training and employment and exchange of foreign and Indian experts.

The article includes a set of charts showing the industries based on agricultural produce, animal products and minerals. A special chart gives a list of the industries which depend on coal as a raw material. The charts indicate, at a glance, the industrial potential of India.

Regarding the question of priorities, the article declares that the power industry deserves the pride of place. Plastics and non-ferrous metal industries should be given a high degree of priority. Basic chemicals and dyestuffs, heavy industries including machine-tool industry, bio-chemical and fermentation industries, building and structural engineering industries and the like should be developed.

Another article gives the data essential for the manufacture of a valuable group of intermediates, derived from the nitration products of chloro-benzene, for the dyestuff and pharmaceutical industries and for synthetic drugs and photographic developers.

The Hedge Contract System for Indian Cotton is the title of an article contributed by Dr. H. L. Dholakia, Ph.D., H. L. College of Commerce, Ahmedabad, to the July 1944 issue (Vol. XIII, Part I) of the *Journal* of the University of Bombay. After noting in brief the factors responsible for the institution of the new Indian Cotton Contract, the writer proceeds to describe its technique in order to enable the reader to appreciate the principles underlying it and its implications. Finally, he compares the old Broach and the new *Jarilla* contracts and comes to the conclusion that the latter is superior in technique and that it has several special advantages over the old one. Suggestions have also been made to improve the contract under the heads of increase of staple length and tendering differences. Dr. Dholakia also suggests that in the post-war period there should be a system of two hedge contracts for Indian cotton in Bombay, one for staple and another for non-staple descriptions, the Bengal styles being looked after by Karachi.

Work and Welfare in the Delhi Cloth and General Mills is the title of an illustrated pamphlet recently issued by the management of this well-known organization. The history of the growth of this company from very small beginnings in 1889 represents a rare record of benefits to workers in the shape of higher wages, better conditions of living and increased welfare. Each department in the mill elects its own Social Worker, who is paid Rs. 20 per month in addition to his regular earnings and who has direct access to the management; the scheme has been useful in establishing goodwill between the workers and the management. There is also provision for the appointment of two directors, one representing the workmen and the other its officers. It is believed that this is the only concern which has its employees on the directorate on an equal footing with the other directors. The Employees' Benefit Fund Trust of the mill was constituted in 1941 with the object of planning and promoting welfare work among mill labourers. The funds of the Trust now exceed Rs. 9,50,000, and the Trust's activities are divided under the heads of financial benefits, education, health, recreation and entertainment, and general amenities.

Anatomical Studies on Jute (Corchorus) with Special Reference to the Formation of Fibre (Indian Central Jute Committee Agricultural Research Memoir, No. 1). Price: Rs. 1-8-0 or 2*s*.

Though next to cotton jute is perhaps the most extensively used fibre, on the anatomical side practically no serious study was attempted, until quite recently Matthews (1924) has described certain microscopic characters of the ultimate fibres, which are useful in identification. A short note published by Nandi and Basu (1938) gives but an incomplete picture of the structure and development of fibres. Lately, Barker (1939) has thrown more light on certain aspects of fibre development and Kundu (1942) has brought out some new points which will be discussed later.

The present work, which was commenced before the publication of either Barker's or Kundu's papers, and briefly reported in the Annual Reports of the Indian Central Jute Committee, is mainly fundamental in its scope, though some commercial aspects have also been studied. For the first time, the root-stem transition and the differentiation of the vascular elements in the seedling have been followed in detail. The progressive development of the various tissues in the ontogeny of the stem has also been traced and an attempt has been made to bring out clearly the different anatomical features, starting from the seedling stage to the mature condition. A large portion of the paper is necessarily devoted to the study of the fibres, as they constitute the commercially most important part of the plant.

ACKNOWLEDGMENTS

Messrs. B. Thanawala & Sons Ltd., 47, Tamarind Lane, Fort, Bombay (manufacturers of cotton driving ropes and spindle tapes, tubular bandings, cotton bandings and spindle bandings) have sent us a useful tear-off wall calendar for the Hindu year which commenced with the latest *Diwali* celebrations.

Messrs. M. Best Cotton Rope Manufacturing Co. (Proprietors : M. J. Thanawala & Co.), 47-49, Forbes Street, Fort, Bombay, have sent us an illustrated wall calendar for the Hindu year which commenced with the latest *Divali*: the illustration is that of Lord Krishna and it is quite attractive.

TRADE LETTERS

(*From Our Special Correspondents*)

Ahmedabad

THE quota system adopted by Government, and in its wake by the local Maskati and Panchkuva Cloth Markets' Associations is eliminating a number of new merchants who are not eligible to any quota or whose quota is not sufficient to enable them to run their shops. The war boom had attracted a number of people, mostly relatives and friends of mill agents, to the cloth trade. They practically ousted the old traders who had to purchase cloth through them at highly inflated rates. The imposition of control merely created a plethora of black markets which could be suppressed by the restoration of the old trade channel and suppression of the new favourite channel.

The Government scheme of approved cloth shops is being enforced in Ahmedabad City. Two classes of shops are to be opened for the sale of cloth at a margin of 10 per cent. as against 20 per cent. permitted by Government for the ordinary trade channel. Very few old merchants are willing to apply for shops for coarser goods while the number of shops to be opened for finer goods is very limited. The public demand for finer goods is evidently insatiable here as elsewhere, while mills manufacturing finer goods are taking to manufacturing coarser goods as they find the latter more remunerative after the recent cuts in prices. Coarser goods are being increasingly dumped in the market although they are not wanted by the people. Some mills have definitely taken to lowering the quality of their products for which prices have been fixed by Government. Ahmedabad mills which dumped in the market heavily sized goods during the last war are now dumping inferior unwanted goods against which bitter complaints are being made but to no avail, unless Government intervenes and fixes prices according to the quality of different kinds of goods. Government will have also to revise prices, according to varying counts, so as to prevent mills switching over from finer to coarser goods. There is already shortage of finer goods which should not be allowed to be accentuated by mills seeking to manufacture more remunerative goods.

Apart from mill production which cannot be increased indefinitely, there are good prospects for increasing handloom production for which it is regrettable no systematic effort is being made. Mahatma Gandhi seems to contemplate a fast to stimulate the prosecution of the constructive programme including his favourite *khaddar* production. While Indian mills are eager to secure supplies of Egyptian cotton to produce finer counts Indian cotton is lying idle, hitting hard the Indian grower who is at a loss to dispose of it. It can be profitably turned into *khaddar* by hand processes which require man-power more than anything else. If the starving people of Bengal and other provinces had been organized for producing *khaddar*, their lives would have been saved, and the prevailing cloth famine appreciably relieved. It is not yet too late to move in this direction, as the war is likely to be unexpectedly prolonged.

Indian industries which have gained considerably from the present war will continue to bask in the sunshine till the war ends, and for some time after. If their development is planned they will stand post-war depression better. While the mill agents are able to take care of themselves and plan future development individually, the small factory owners of Ahmedabad have decided to plan collectively. They have recently formed an association which has decided to invite Sir Visvesvaraya to guide them in planning the manufacture of steel machinery which Indian industries will require after the war. They are at present supplying spare parts made of iron. Iron works which have sprung up during the war can be combined and turned into steel works after the war under expert guidance. Gujerat, which has attained an eminent position in cotton manufacture, is fast developing her primitive iron industry under the impetus of war. She can develop it into an efficient steel industry.

The Textile Labour Association, Ahmedabad, which has been foiled in its attempt to devise a scheme of compulsory savings for workers, who earn the highest dearness allowance in the country, has decided to open a co-operative bank for collecting their voluntary savings in order to finance various co-operative schemes for their betterment. The voluntary savings of about 120,000 workers of Ahmedabad who earn about Rs. 1,20,00,000 every month, if systematically collected, can amount to a big sum which can be utilized to their great advantage. The Labour Association was the first to start the Kasturba Memorial Fund which amounts to about Rs. 1,40,000. It has not been handed over to the All-India Fund, but kept separate for the workers of Ahmedabad. This will form the nucleus of labour welfare activities which the Labour Association intends to promote more vigorously than before. It has made repeated attempts in the past in this direction. It has started schools, hotels, co-operative housing societies, hospitals, etc. These activities will be intensified now when the workers are financially better off, and are frittering away their earnings in drink and other vices. After the unsuccessful attempt of the Congress Government to introduce prohibition in Ahmedabad, workers spent their earnings in drink and other vices. The Labour Association conducted a vigorous campaign against these vices which produced the desired effect. It is hoped that its welfare activities will meet with equal success for the lasting good of the workers who constitute the bulk of the population of an industrial city.

South India

Scarcity of Mill Cloth for "Divali"

PROSPECTIVE *Divali* purchasers in Madras were rather intrigued by the scarcity of mill-made cloth in cloth shops. It was thought that with the approach of *Divali* sufficient quantities of cloth would be arriving in the market from the various mill centres. But generally buyers found only hand-made cloth. Many shop-owners said that they did not get sufficient quantities, and that the cloth merchants generally elected to import only the hand-woven products which were priced at higher rates and at the same time provided a wider margin of profits.

Silk Supply to Handloom Weavers

A lengthy memorandum has been submitted to Mr. R. W. Targett, Director-General of Supplies, on behalf of the handloom and powerloom weavers in silk in Mysore State, which represented that the Government of Mysore had all along been encouraging cottage and home industries and as a result there were at present more than 5,000 handlooms and 1,000 powerlooms weaving silk, which had been now hard hit on account of the price of raw silk having gone up by 10 to 12 times. The memorandum further stated that since the Mysore Government were selling silk in public auction, the poor people engaged in cottage industries were unable to compete with rich merchants who bought silk in the auctions at high prices. Some of them were said to be coming even from outside the State. The memorandum urged that the Mysore Government should fix the maximum price of twisted silk at about Rs. 25 per lb. and that apart from their supply of silk to the Government of India for Defence purposes they should reserve certain quantity of silk for distribution to the handloom and powerloom weavers in the State. The memorandum expressed gratification that it was understood that maximum prices for silk were going to be fixed in British India and hoped that this would enable the Mysore Government to fix the prices of silk in the State at an early date and thus relieve the hardships of the handloom and powerloom weavers.

Cloth for Destitute Women

The Hyderabad Government have contributed Rs. 1 lakh for the supply and distribution of cloth to deserving women and children in the State. Cloth worth Rs. 20,000 has been set apart for distribution through the Hyderabad Women and Children's Medical Aid Association among the poor in Hyderabad City.

Mysore Mulberry Silk-worm Reared in Ceylon

The mulberry silk-worm has been reared for the first time in Ceylon as the result of a successful experiment carried out by the first Ceylonese to study sericulture in India, Mr. K. Ranganathan, who returned recently to Ceylon after a one-year course at the Government Silk Farm in Mysore.

The first lot of eggs which were brought from Mysore arrived in the Island some time ago hatched out in the normal period. The caterpillars built cocoons in due course, and silk-thread is now being reeled.

The ease with which the experiment has achieved success indicated that it is only the amount of mulberry leaf that is available that will limit the development of a cottage industry in Ceylon.

Receipts of Raw Cotton in Madras

The receipts of loose cotton at presses and spinning mills in the Madras Province from 1st February to 29th September 1944 amounted to 383,081 bales of 400 lbs., lint as against an estimate of 481,000 bales of the total crop of 1943-44. The receipts in the corresponding period of the previous year were 347,726 bales. 507,313 bales, mainly of pressed cotton, were received at spinning mills and 3,943 bales were exported by sea while 153,392 bales were imported by sea mainly from Karachi and Bombay.

Standardizing Shades of Yarn

With a view to standardizing the shades of yarn and fixing the cost of dyeing, Mr. S. Venkateswaran, Provincial Textile Commissioner, convened recently a conference of dyers in the Madras Province. Representatives from Guntur, Nellore, Madras, Madura, Conjeevaram and other places, who attended the conference, had a discussion with the Commissioner on the working of the scheme adumbrated by him in the matter of distribution of yarn and the classification of dealers, and nearly all of them stated that the scheme was giving entire satisfaction to the dealers and buyers. The Commissioner stated that it was proposed to license all dyers. It was resolved at the conference that the dyers should be treated as wholesalers in the matter of assessing the margin of profit. It was also decided that dyers should have no looms under their control.

Discussion then ensued regarding the practicability of fixing standard grades of colours and the dyeing charges. It was pointed out that it would be difficult to have uniform standards of colours, but that only a rough classification into fast colours and colours which might fade was possible. Some of the dyers stated that one dyer could not keep a uniform standard of dyeing always. It was decided that the dyers should keep shade-cards of the different colours used by them and also the charges for dyeing. The Commissioner requested the representatives to send to the office estimates of dyeing charges for different shades with a view to finding out whether any definite amount could be fixed.

Piecegoods Imports

Problems relating to import of piecegoods were discussed by the members of the Madras Piecegoods Merchants' Association on the 20th October, with Mr. F. M. Innes, Chief Controller of Imports.

The Association, in a memorandum presented to Mr. Innes, pointed out that Indian mills were hostile to importers and the quota system, now in force, disqualified importers from claiming a share in the Indian mill products. Claims of importers for import licences, it was urged, should be recognized and the licences granted in the case of those who during the evacuation period had failed to apply for them in time.

Mr. Innes said that the United Kingdom was at present unable to allow exports of cotton piecegoods to India. A very small quantity of high class goods was coming from the U.S.A. In the case of woollen piecegoods small quantities were being received from the United Kingdom. The case of rayon piecegoods was considerably more encouraging and although the United Kingdom was not able to supply large quantities they had been given a very satisfactory allocation from America. A quota for mixed rayon piecegoods had been fixed, based on past imports from all sources including Japan. This would give a share in the trade to firms whose previous connections were with Japan and other belligerent countries.

One member asked if in view of the fact that the Indian mill production had increased and in view of the improvement in the war situation the Government of India were not likely to place large war orders hereafter with the Indian mill industry and if it was proposed to place any restriction on the import of British piecegoods into India. Mr. Innes answered that he could not give any forecast of the Government's post-war import control policy.

Madras College of Technology

A site about 47 acres in extent, adjacent to the Engineering College, Guindy, Madras, has been selected for location of the Dr. Alagappa Chetti College of Technology recently inaugurated and now carrying on work in the Engineering College. It is gathered that arrangements will soon be put through for alienation by Government of lands in favour of the institution.

Cawnpore

New Rationing Scheme

THE U. P. Government's hundred per cent. rationing scheme in a certain number of selected towns and cities, it is now announced, will be enforced as from 1st February 1945. For the present rationing is to be enforced in 13 towns and some of the cities like Lucknow, Cawnpore, Allahabad, Benares and Gorakhpur. The quantities to be given are 8 *chhataks* (4 *chhataks* of wheat and 4 *chhataks* of rice). The labour classes and those given to manual labour will get 8 *chhataks* of rationed wheat or rice and 4 *chhataks* of unrationed gram.

Post-war Plans

The post-war plans of the Government are now complete. The first Five-Year Plan which they have chalked out comprises 158 schemes, involving an expenditure of Rs. 120 crores which will be spread over the whole of the United Provinces, and working out to about Rs. 22 *per capita* expenditure. Although most of the development schemes are calculated to benefit demobilized soldiers, about 14 special schemes have been formulated to meet their special requirements. The most important of the schemes comprise irrigation and allied hydro-electric projects which is to cost a capital expenditure of Rs. 25 crores. The production and generation capacity of power (hydro-electric) is to be about 48,000 kcw. and the peak capacity of five-year hydro-electric schemes is 296,250 kcw. The Plan also provides 14 industrial schemes, six were or are to encourage and foster small-scale cottage industries.

As a first step it is announced that the Government would send abroad 300 persons for training in industries, education, medical public health, electrical and mechanical training and co-operation, for carrying out post-war planning. And according to the tentative programme during the first year 32 persons, in the second year 63 and in the third year 66, fourth year 70 and fifth year 70 trainees will be sent. These persons will be mostly recruited from the fighting forces either at the front or in the army during the war. It will also be necessary to recruit some experts from Europe or America for handling complicated problems.

Cloth Control

A new scheme for equitable distribution of imported cloth throughout the province has been prepared by the Local Government. The Textile Commissioner to the Government of India has not accepted the suggestion of the U. P. Government that only persons nominated by them should be allowed to import cloth. The arrangement for the distribution of frozen cloth allotted for this province with dealers of Cawnpore has been extended up to the end of November 1944. It was in the first instance for a period of three months only from June to August, and supplies of 70,000 bales were intended for that quarter, and the operations for this period exceeded Rs. 50 lakhs. It is also learnt that the U. P. Government are considering the question of appointing a Textile Commissioner for United Provinces to regulate the working of the U. P. Cloth and Yarn Control Order and deal with various problems affecting this trade and industry. The Provincial Government has viewed with concern the black marketing rampant in the province and attempts by manufacturers and dealers to evade the provisions of the Cloth and Yarn Control Order. The appointment of this officer will be made with the object of placing cloth and yarn controls in the province on a proper footing and to start a province-wide drive to root out black market in this trade.

During the four months ending September 1944 the Textile Control authorities have either cancelled or suspended the cloth licences of over 900 dealers in the province, besides launching prosecutions against 470 dealers for breaches of either the Cotton Cloth and Yarn Control Order or the Provincial Licensing Order. During the month of September alone 100 dealers were prosecuted, 61 of whom being found guilty and sentenced to pay fines of varying amounts upto Rs. 2,000. Two partners of a firm were each sentenced to three months' rigorous imprisonment in addition to a fine of Rs. 1,000 for having charged 10 per cent. more than the ceiling retail price printed on the cloth.

The question of "Standard Cloth" has indeed become a problem, according to local opinion, both to the Government and the traders alike. Since last January, it is reported that thousands of standard *dhotis* and *saris* have been lying unsold in shops and godowns because they are either too short or too large. In some districts they were made into garments and then put up for sale but even then they could not be sold. In Lucknow alone the unsold stocks exceed 250 bales. The owner of a local Standard Cloth shop lamented: "We have seldom received the sizes we actually asked for. Instead of that we have received sizes which would fit either a dwarf or a giant."

Personal

Mr. J. E. Pedley, I.C.S., C.I.E., J.P., Labour Commissioner, United Provinces, for the past four years, has now been transferred and Mr. K. R. Malcolm, Magistrate and Collector, Allahabad, has been posted to Cawnpore as the new Labour Commissioner.

The Provincial Government has put in charge Mr. M. J. Rab, Assistant Director of Industries, to carry out an industrial and commercial survey of the United Provinces for post-war development.

Ahmedabad Advance Mills' Fairly Good Year

In his speech at the annual general meeting of the shareholders of the Ahmedabad Advance Mills, Ltd., in Bombay on Tuesday, the 24th October 1944, Sir Sorab Saklatvala, Kt., observed:—

"The year under report has proved a good one for the textile industry. In my speech last year I had made mention of the Cloth and Yarn (Control) Order which came into force from 17th June 1943. From August 1943 prices of cloth and yarn were controlled under that order, and thereafter reductions in prices were made from time to time, the last reduction being made as recently as September last.

"You must have seen from the accounts that your company has made a fairly good profit, but I would point out that though the gross profit for the year is higher than that of the previous year, the profit available for disposal is much less, a very large portion having been absorbed by taxation and compulsory E.P.T. deposit. You will notice that in spite of a profit of over Rs. 25 lakhs we have been able to carry only Rs. 4 lakhs to reserve which is approximately the amount of compulsory E.P.T. deposit for the year. This deposit, together with the deposits made for the years 1942 and 1943, amounts to Rs. 6,33,692, and this sum we shall have to our credit with Government, to be repaid to us one year after the termination of hostilities, or two years after the date of deposit, whichever is later. I need hardly tell you that we shall need all these reserves and even more to meet the expenses of post-war reconstruction when extensive replacements and renovations of our already over-taxed plant and machinery will have to be carried out.

"The coal situation had remained critical almost throughout the year and it is still causing us a great deal of anxiety. Short supplies and transport difficulties are constant features. In these circumstances, to avoid stoppage of the mills, we had to supplement our fuel by using high-priced firewood to a considerable extent. This accounts for the high fuel charges for the year mentioned in the report."

Fixation of Wages in Travancore

Bill to Provide for the Establishment of Trade Boards

THE Government of Travancore have recently published the Travancore Trade Boards Bill which provides for the establishment of trade boards "in such trades or branches of work in trades" as Government may from time to time direct. The Boards will report on any matter referred to them by Government with reference to the industrial conditions of the trade or class of trades for which they are formed, as also to fix a minimum rate of wages. The duties and powers of these Boards with respect to fixing the minimum wages are set out in section 6, which is reproduced below :—

"(1) Every Board shall, subject to the provisions of this section, fix a minimum rate of wages for time-work in their trade (in this Act referred to as 'a general minimum time-rate)' and may also fix for their trade—

(*a*) a general minimum rate of wages for piece-work (in this Act referred to as 'a general minimum piece-rate');

(*b*) a minimum time-rate (which shall not be higher than the general minimum time-rate) to apply in the case of workers employed on piece-work for the purpose of securing to such workers a minimum rate of remuneration on a time-work basis (in this Act referred to as 'a guaranteed time-rate'); and

(*c*) a minimum rate 'whether a time-rate or a piece-rate' to apply in substitution for the minimum rate which would otherwise be applicable in respect of hours worked by a worker in any week or on any day in excess of the number of hours declared by the Board to be the normal number of hours of work per week or that day in the trade in this Act referred to as 'an over-time rate.'

(2) Any of the minimum rates under sub-section (1) may be fixed so as to apply universally to the trade or so as to apply to any special process in the work of the trade or to any special area, or to any class of workers in the trade, or to any class of workers in any special process or in any special area.

(3) The power of a Board to fix the minimum rate of wages shall include the power to fix a series of minimum rates to come into operation successively on the expiration of specified periods, and the power to vary a minimum rate shall include the power so to vary a rate that the variation shall be operative only during a specified period.

(4) The expression 'minimum time-rate' includes the time-rate of any kind fixed under the provisions of this Act.

(5) If a Board report to Government that it is impracticable in any case to fix a general minimum time-rate in accordance with sub-section (1), Government may take such action as they deem fit.

(6) A Board may, if they think it expedient, cancel or vary any minimum time-rate or general minimum piece-rate fixed under this Act and shall reconsider any such minimum rate, if Government direct them to do so, whether an application is made for the purpose or not.

(7) A Board shall, on the application of any employer, fix a special minimum piece-rate to apply as respects the persons employed by him in cases to which a general minimum time-rate or a piece-work basis time-rate but no general minimum piece-rate is applicable, and may as they think fit, cancel or vary any such rate either on the application of the employer or after notice to the employer, such notice to be given not less than one month before the cancellation or variation of any such rate.

(8) Before fixing, cancelling or varying any minimum rate of wages, not being a special minimum piece-rate, the Board shall give notice of the rate which they propose to fix, or of their proposal to cancel the rate, or of the proposed variation in the rate, as the case may be, and shall consider any objections to the proposal which may be lodged with them within two months from the date of the notice.

(9) Where a Board fix a special minimum piece-rate under sub-section (7) or cancel or vary any rate fixed under the said sub-section, they shall give to the employer notice of the fixing, cancellation or variation as the case may be."

The following Statement of Objects and Reasons is published with the Bill:—

"The Board constituted by Government to inquire into and investigate the conditions of labour in the State with a view to settling disputes on a conciliation basis, in their report have recommended to Government the desirability of fixing minimum wages with the assistance of a wage-fixing machinery constituted on a statutory basis and functioning on the lines of the British Trade Boards. Government, after carefully considering the recommendations and representations, are satisfied that it is necessary in the interests of labour that proper machinery for fixing wages on a statutory basis should be constituted. Hence the Bill.

The Bill, though drawn largely on the lines of the British Trade Board Acts of 1909 and 1918, contains a few additional provisions. The main feature of the Bill is that it provides for the establishment and constitution of Trade Boards for those trades to which the Bill applies and the introduction of minimum rates of wages for workers engaged in such trades. The Trade Board will be constituted by the Government and will consist of five members nominated by them, two of whom to represent the employers in their trade and two to represent the workers in their trade. The Chairman of the Board will be an officer of the Government. The Board has power to fix minimum rates of wages for workers both on time-work basis and on piece-work basis. Different rates may be fixed for different trades and for different classes of workers. They have also power, on their own initiative or on application made to them, to cancel or vary any minimum rate fixed by them. The rates fixed, varied or cancelled by the Board will take effect only on confirmation by the Government. An employer who does not pay wages in accordance with minimum rates shall be liable on conviction to a fine which may extend to two hundred rupees.

Indian Mill Finance

Working of Textile Companies

Sir Shapurji Broacha Mills, Ltd., Bombay

(Agents : The Provident Investment Co., Ltd.)

The trading profit of the company for the year ended 31st March, 1944 is Rs. 1,03,70,927-9-4 from which have been deducted the provision for income-tax, corporation-tax and excess profits tax of Rs. 76,59,889, and provision for compulsory deposit (estimated amount required for compulsory E.P.T. Deposit) Rs. 18,40,000. Adding the balance, after adjustments, of the amount carried forward from previous year of Rs. 20,83,666-10-9 the balance available for disposal is Rs. 29,54,705-4-1. The directors recommend the disposal of the same as under : To write off for depreciation on buildings Rs. 1,75,000, machinery Rs. 1,35,000, electric power installation Rs. 8,000, sprinklers Rs. 500, humidifiers Rs. 2,000, motor wagons and car Rs. 100 and furniture Rs. 200; to place to reserve fund Rs. 15,00,000 ; to take to dividend equalization fund Rs. 1,00,000 ; to pay dividend for the year ended 31st March 1944, at 10 per cent. free of income-tax on 82,036 conversion shares Rs. 8,20,360; on 152,319 deferred shares Rs. 38,079-12-0 ; to take to workmen's welfare fund Rs. 40,000 ; staff welfare and gratuity fund Rs. 25,000 and to carry forward to the next account Rs. 1,10,465-8-1.

The amount paid by way of dearness allowance and included in the item of mill establishment and mill wages is Rs. 19,39,578 for the year. Rs. 3,14,124 have also been paid to mill workers as war bonus for the year 1943.

The company's buildings, machinery and stock and stock-in-trade have been insured for Rs. 1,70,89,161, against fire.

The company's profits and standing charges have been insured against stoppage by fire and riot for a period of three years indemnity for Rs. 2,00,00,000.

The company's buildings and machinery have been insured under War Risks (Factories) Insurance Ordinance 1942 and stock and stock-in-trade have been insured against riot and civil commotion risks and also covered under Government War Risks (Goods) Insurance Scheme.

Central India Spinning, Weaving and Manufacturing Co., Ltd., Nagpur

(Agents : Tata Sons Ltd., Bombay.)

The profit for the year ended 30th June 1944 after making a provision of Rs. 6,00,000 for depreciation and of Rs. 73,50,000 for taxation, amounts to Rs. 19,57,541. Adding thereto the balance brought forward from the accounts of the previous year Rs. 37,641 the total comes to Rs. 19,95,182. Deducting therefrom the amount paid as *ad-interim* dividends, free of income-tax, for the half-year ended 31st December 1943 on preference shares at Rs. 12-8 per share Rs. 1,25,000 and on ordinary shares at Rs. 10 per share Rs. 4,68,750, and also taking to the reserve fund Rs. 7,75,000 a balance of Rs. 6,26,432 is left which the directors recommend be appropriated as follows :—Payment of final dividends, free of income-tax, for the year ended 30th June 1944 on preference shares at Rs. 12-8 per share Rs. 1,25,000 and on ordinary shares at Rs. 10 per share Rs. 4,68,750 leaving to be carried forward Rs. 32,682.

The workers of all mills in C.P. and Berar went on a strike demanding higher basic wages and higher dearness allowance. This mill was also affected by the strike which lasted for about 2½ months.

The properties of the company at Nagpur and other places and the stocks have been insured against fire and riot risks for Rs. 3,57,85,256. Profits and standing charges have been insured against fire and riot risks for Rs. 85,00,000 per annum, indemnity being payable for 24 months. Insurance has also been taken under the War Risks (Factories) Insurance Ordinance for Rs. 1,53,79,400. Under the War Risks (Goods) Insurance Ordinance, all insurable stocks were kept fully covered throughout the year.

Mysore Spinning and Manufacturing Co., Ltd., Bangalore

(Agents : N. Sirur & Co., Ltd., Bombay)

The result of the company's operations during the year ended 29th February, 1944 shows a profit of Rs. 45,77,339-12-10 which with Rs. 13,29,608-4-11 (inclusive of provision for taxation) brought forward from the previous year's account makes a total of Rs. 59,06,948-1-9. From this sum the directors have declared an *ad-interim* dividend of Rs. 2 per share and bonus of Rs. 4 per share on 29,802 shares absorbing Rs. 1,78,812 and have allocated to provision for taxation Rs. 24,00,000 ; depreciation on buildings Rs. 1,00,000 ; depreciation on machinery Rs. 2,00,000 ; reserve fund Rs. 20,00,000 and labour colony fund Rs. 3,00,000 ; leaving a balance of Rs. 7,28,136-1-9. The directors propose to dispose of same as under :—Final dividend of Rs. 4 per share and a bonus of Rs. 4 per share for the year on 29,802 shares of Rs. 50 each (making a total of Rs. 14 per share for the year or 28 per cent. per annum) Rs. 2,38,416 ; bonus to company's staff at Bangalore Rs. 23,000 ; and to carry to next year's account Rs. 4,66,720-1-9.

With a view to strengthen the financial position of the company the directors have under consideration a scheme to increase the authorised capital of the company from Rs. 15 lakhs to Rs. 50 lakhs by the creation of further 30,000 ordinary shares of the face value of Rs. 50 each and 40,000 preference shares of the face value of Rs. 50 each, and subject to consent of Government being obtained in that behalf, to issue as fully paid up, 14,901 cumulative preference shares by capitalizing Rs. 7,45,050 out of the reserve fund of the company. These cumulative preference shares will carry a fixed preferential dividend of 4½ per cent.

The mill property and stocks are insured for the sum of Rs. 1,04,40,630 and the profits and standing charges for Rs. 45,00,000 for 24 months' benefit, that is Rs. 22,50,000 annually. In addition, the company's buildings, machinery, stock and stores have been insured against war risks as required by the Government of India Ordinances and the War Risks Insurance Emergency Act of the Government of Mysore.

Ahmedabad Advance Mills, Ltd., Ahmedabad

(Agents : Tata Sons Ltd., Bombay)

The profit for the year ended 30th June 1944 after making a provision of Rs. 1,33,000 for depreciation and of Rs. 17,80,000 for taxation, amounts to Rs. 6,33,343. Adding thereto the balance brought forward from the accounts of the previous year Rs. 22,716 the total comes to Rs. 6,56,059. Deducting therefrom the amount paid as *ad-interim* dividends, free of income-tax, for the half-year ended 31st December 1943 on preference shares at Rs. 2-8 per share Rs. 25,000 and on ordinary shares at Rs. 8 per share Rs. 80,000 and also taking to the reserve fund Rs. 4,00,000 a balance of Rs. 1,51,059 is left which the directors recommend be appropriated as follows :—Payment of final dividends, free of income-tax, for the year ended 30th June 1944 on preference shares at Rs. 2-8 per share Rs. 25,000 and on ordinary shares at Rs. 10 per share Rs. 1,00,000 leaving to be carried forward Rs. 26,059.

During the year under report the company received, in full repayment of its holding of the debentures of the value of Rs. 7,11,600, a sum of Rs. 5,31,600 in cash, at the rate of Rs. 443 per debenture, and Rs. 1,80,000 in redeemable preference shares, bearing cumulative interest at 4 per cent. per annum. A sum of Rs. 14,737 has also been received for interest due on the debentures for the year 1943, at the rate of Rs. 16-9-9 per debenture less income-tax.

The company's buildings, machinery and stocks have been insured for Rs. 1,26,59,000. Profits and standing charges have been insured for a sum of Rs. 25,00,000 per annum, the indemnity being payable for 24 months. Insurance has also been taken under the War Risks (Factories) Insurance Ordinance for a sum of Rs. 50,51,500. Under the War Risks (Goods) Insurance Ordinance all insurable stocks were kept fully covered throughout the year.

Bangalore Woollen, Cotton and Silk Mills Co., Ltd., Bangalore

(Agents : Binny & Co. (Madras) Ltd., Madras)

The result of the company's working for the six months ended 30th June 1944, after allowing Rs. 4,04,776 for depreciation is a profit of Rs. 3,96,711-1-10 to which is added the unappropriated profit brought forward of Rs. 56,488-3-6 making a total of Rs. 4,53,199-5-4. Out of this the directors have made a payment of dividend at Rs. 3 per share on the 6 per cent. cumulative preference shares for the half-year ended 30th June 1944, free of income-tax of Rs. 18,000 and propose to deal with the balance as follows :—To pay a dividend of Rs. 6-4 per share on the ordinary shares for the half-year ended 30th June 1944 at the rate of 12½ per cent. per annum, free of income-tax Rs. 1,26,562-8 ; to workpeople's housing reserve Rs. 30,000 ; to officers' retiring fund Rs. 15,000 ; to fire, accident and insurance reserve Rs. 30,000 ; and to carry forward Rs. 2,33,636-13-4.

Cawnpore Textiles, Ltd., Cawnpore

(Agents : Begg, Sutherland & Co., Ltd.,)

The working of the company for the half-year ended 30th September, 1943, after providing for taxation, shows a profit of Rs. 7,20,615-5-5 from which has been deducted debenture sinking fund Rs. 6,250 ; depreciation Rs. 1,00,000 and general reserve Rs. 2,49,685-13. Adding the carry forward from the previous half-year of Rs. 1,03,309-14-9 the credit of profit and loss account is Rs. 4,67,989-7-2. The directors recommend that this balance should be disposed of as follows :—In payment of a dividend of As. 8 per share for the half-year ended 30th September, 1943 Rs. 3,00,000 and to carry forward Rs. 1,67,989-7-2.

Delhi Cloth and General Mills Co., Ltd., Delhi

(Managing Directors: Sir Shri Ram and Lala Shankar Lall)

The profits of the company for the year ended 30th June 1944, after setting aside Rs. 13,00,000 for depreciation (as estimated for income-tax purposes), Rs. 4,65,000 for the estimated remuneration of the Managing Directors and Rs. 1,35,00,000 to the taxation reserve, come to Rs. 46,04,003-1 which, together with Rs. 1,61,645 brought forward from the preceding year, makes up Rs. 47,65,648-1.

The directors recommend that the above amount be disposed of as follows:—Dividend on ordinary shares of the face value of Rs. 25 each at Rs. 3 per share and a bonus of Re. 1 per share, making Rs. 4 in all Rs. 19,77,644; proportionate dividend and bonus on ordinary share of Rs. 2-8 each Rs. 16,000; proportionate dividend and bonus on partly paid up shares Rs. 749-4; dividend on preference shares Rs. 90,000; charity Rs. 1,00,000; dividend equalization fund Rs. 7,00,000; general reserve Rs. 17,00,000; and carried forward Rs. 1,81,254-13.

The deposits in respect of excess profits which have been made with Government up to the 30th June 1944 relating to the profits up to the year ended 30th June 1943 amount to Rs. 38,52,247.

The fall in profits is due to lower prices of textiles and also to some extent higher dearness allowance.

All the factories worked peacefully during the year and relations with labour were on the whole cordial. There was acute labour shortage in all the factories as a consequence of the enormous demand from Government for labour, chiefly in connection with public works.

The mill engineers, without any outside help, very successfully changed over Mill No. 2 in Delhi from the old engine drive to the new turbo-electric drive. The change-over will give a substantial recurring reduction both on wages and on coal.

During the last five years, it has not been possible to replace certain machinery which was due for replacement, but all possible steps have been taken to keep the machinery in the highest state of repair that is possible under the extremely difficult conditions prevalent now.

NEWS OF THE MONTH

Indian

Cotton Consumption in Textile Mills.—The Indian cotton textile industry consumed 347,283 bales of Indian cotton in August 1944 as compared with 377,394 bales in the same month in 1943. The total consumption of Indian cotton by the industry during the cotton year ended 31st August amounts to 4,116,525 bales as compared with 4,306,831 bales in the preceding year.

Indian Labour Delegates Return.—Mr. V. B. Karnik and Miss Maniben Kara, members of the delegation of the Indian Federation of Labour, have arrived in Bombay, after an extensive tour of Great Britain lasting over four months. During their stay they studied conditions of labour in England, and the facilities provided to English labourers by the British Trades Union Congress. The third member of the delegation, Mr. M. A. Khan, returned to India a few days earlier.

Horniman Golden Jubilee: Appeal for Funds.—Sir Chimanlal Setalvad, Kt., Chairman, Horniman Golden Jubilee Committee, has appealed for funds to celebrate the completion of fifty years in journalism by the veteran journalist, Mr. B. G. Horniman. Mr. Horniman came to India in April 1906 and since then he has made India his motherland. It is proposed to commemorate his services to this country in a befitting manner and for this purpose donations may be sent to Mrs. Bapsey Sabavala, Joint Honorary Treasurer, The Horniman Golden Jubilee Committee, Industrial Assurance Building, opposite Churchgate Station, Bombay.

Indian Cotton Piecegoods for Egypt.—The Egyptian authorities have applied to the Government of India for permission to export from India to Egypt a quantity of tea and of cotton piecegoods, according to Egyptian commercial circles in Bombay. They understand that no reply has yet been received. "There is no cloth in the shops in Egypt, and people cannot even buy new cloth to bury the dead, as is the custom. The poor people are feeling the scarcity of cloth and of tea very keenly," said an Egyptian business man to a Press representative.

Textile Calendar

OCTOBER

25th, Wednesday:

Association of Indian Industries, Bombay, First Quarterly General Meeting.

31st, Tuesday:

Bombay Textile and Engineering Association, Unveiling of Portrait of the late Mr. Cawasji D. Panday by Sir Homi Mehta, K.B.E.

NOVEMBER

10th, Friday:

Indian Merchants' Chamber, Bombay, Quarterly General Meeting.

V. J. T. Institute, Textile Association, lecture on "Some Aspects of Recent Research Work at the Institute," by Prof. D. F. Kapadia, B.A., M.Sc. (Tech.), at Electric House, Fort, Bombay.

22nd, Wednesday:

Association of Electricity Undertakings, Bombay Province, Fourth General Meeting, Electric House, Colaba, Bombay.

Bombay Textile Workers' Demand.—A bonus equal to three months' wages for 1944 is demanded on behalf of the textile workers in Bombay City by Mr. S. G. Patkar, General Secretary, Bombay Girni Kamgar (Red Flag) Union, in the course of a statement to the Press. Mr. Patkar says that the industry has earned unprecedented profits during the current year and that the workers have agreed to the staggering of holidays and averted the shortage of cloth by not going on strike to enforce their last year's demand for three months' bonus.

Foreign Markets for Indian Goods: Procedure for Making Trade Inquiries.—Firms and individuals in India sometimes address Indian Trade Commissioners overseas for information relating to foreign markets for Indian goods. In order to avoid delays which such a course invariably involves, they are advised to approach the

Director of Commercial Intelligence, No. 1, Council House Street, Calcutta, who is fully equipped to furnish such information from his records.

Firms in India are also advised to address their requests for trade introductions to firms in foreign countries to the Director of Commercial Intelligence who will forward them to the Indian Trade Commissioners concerned with his recommendation and such particulars regarding the firms as may be required for the consideration of these requests.

Annual Bonus for South Indian Workers.—At a recent meeting of the Southern India Millowners' Association, held at Coimbatore, Dewan Bahadur C. S. Ratnasabapati Mudaliar presiding, it was resolved to recommend to member mills that an annual prosperity bonus be paid, equivalent to three months' basic wages only actually earned, calculated as one-fourth of the total earned wages during the previous 12 months ending 31st August 1944. In spite of the fact that the trade conditions during the current year have not been as prosperous as those of the last year, the Association's decision to increase the annual bonus to three months, as against two months' paid last year is purely with a view to having some future savings for the worker and it is recommended that this additional one month's wages be saved for the worker in the form of either War Savings Certificates or as share capital in co-operative and any other registered credit society attached to the mill and each mill shall pay in cash two months' wages only.

Industrial Stoppages in British India : Decrease in Number of Workers Involved.—One hundred and nine industrial stoppages involving 92,481 workers occurred in British India during the fourth quarter of 1943 as against 148 stoppages involving 147,057 workers during the same quarter of the previous year. The total number of man-days lost was 293,961 as against 585,833.

There were only three stoppages involving 5,000 or more but less than 10,000 workers and in no stoppage 100,000 or more man-days were lost.

Textile (cotton, silk, woollen and jute) mills accounted for 40 per cent. of the number of stoppages, 72 per cent. of the workers involved and 66 per cent. of the man-days lost. In 55 stoppages or 50 per cent. of the total, the demands related mainly to wages or bonus.

The number of stoppages in which the workers were wholly or partially successful was 59 or 57 per cent. of the total number of stoppages which ended during the quarter and in 38 per cent. the workers were wholly unsuccessful.

Intensification of Research : Bombay University's Move.—The Bombay University's Department of Chemical Technology is strengthening its research organization and has ordered part of the equipment for its newly started Food and Drugs Section and for additional sections dealing with oil, fats, soaps, plastics, paints and varnishes. Research into pharmaceuticals and fine chemicals also will be developed.

More than Rs. 2,50,000 are to be used for a pilot house plant for the study of processes employed in the conversion of coal-tar raw materials into dyes, the construction of a laboratory for advanced research in textile chemistry, and the study of modern methods of finishing textiles. Such problems as anti-creasing, waterproofing, and shrink-proofing, and the imparting of other special effects to cotton fabrics, are also to be studied. There will be two research assistantships, so that the work may be carried out continuously.

Among the experiments recently completed are the bleaching of silk fabrics, tests of the fastness of khaki dye, and examination of used photographic solutions for recovery of the chemicals.

The University is considering the starting of research courses in history, politics and anthropology.

Indian Jute Industry in 1943-44.—The jute year 1943-44 was distinguished by three important features, namely, the large American order for 70,000,000 yards of hessians, the fixation of maximum prices by the Indian Jute Mills' Association and later fixation of maximum and minimum prices by Government; and a change in the seasonal pattern of activities, according to the Indian Central Jute Committee Bulletin of September.

The output of raw jute during the year was 70 lakh bales, 20½ lakh bales less than the previous year's production. Exports of raw jute amounted to 9.7 lakh bales compared with 12 lakh bales in the preceding year. The Indian Jute Mills' Association turned out a total supply of 2,668 million yards of cloth of all kinds. This output was less than that of the previous year by about one-third. The decline was mainly in hessians and caused by coal shortage and other difficulties. Exports of manufacture were smaller than last year. The fall was experienced mainly by hessians which fell from 1,528 million yards to 1,095 million yards while sackings registered a decline of 66 million yards from 368 million yards. Prices of both raw and manufactured jute were influenced by the fixation of ceilings, first by the Jute Mills' Association and later by Government. They were on the average higher than in the previous year. Manufactured jute prices, however, went through somewhat smaller variations than raw jute prices with the consequence that the average ratio between the two was higher in the year under consideration than in the previous year.

V. J. T. Institute: Expansion of Mechanical and Electrical Departments.—The first batch of additional students are expected to begin training shortly under the newly sanctioned expansion scheme for the Victoria Jubilee Technical Institute, Bombay, the oldest institute of its kind in India.

The scheme will run for five years in the first instance and total expenditure will be over Rs. 10 lakhs. The Mechanical and Electrical Engineering Departments of the Institute will be expanded so that a 50 per cent. addition can be made to the number of students under training in either department.

Provision is made for buying special equipment for the mechanical and electrical engineering laboratories and workshops as well as for additional space and staff. Sanction has also been given for the establishment of a high tension laboratory.

The scheme thus has a twofold objective —the training of more students and increased facilities for the type of training which will be most useful in the immediate post-war period.

The Institute's expansion is, of course, related to the Bombay Government's post-war development plans, the first stage of which includes the training of the large body of qualified men who will be needed to carry out the work.

In the selection of students priority will be given to those returning from war service in the Army, Navy and Air Force. A number of free studentships will be made available and Government will have priority in claiming the services of students after they have completed their courses.

Industrial Research Committee Record Evidence in Bombay.—The Industrial Research Committee, presided over by Sir Shanmukham Chetty, appointed by the Government of India to investigate and report on the facilities for industrial research in India, recorded the evidence of Mr. B. J. Wadia, Vice-Chancellor of the University of Bombay, Dr. K. Venkatraman, head of the Department of Chemical Technology, Mr. G. R. Paranjpe, Principal of the Royal Institute of Science, and Dr. Mata Prasad on facilities for industrial research in the institutions in Bombay.

Problems of a general strengthening of the scientific departments of the universities and scientific institutes of university rank, questions relating to the establishment of administrative machinery for guiding and co-ordinating industrial research, and the setting up of a Bureau of Standards under the central organization for industrial research were also discussed by the committee.

In the afternoon, the Committee met representatives of the Indian Merchants' Chamber and the All-India Manufacturers' Organization including Mr. M. A. Master, Vice-President of the Chamber, and Mr. Sankalchand G. Shah, Vice-President of the Manufacturers' Organization.

The Committee also heard Mr. G. N. Mitter, Chief Assayer of H.M.'s Mint, Bombay, and Mr. K. N. Mathur, Assistant Director, National Physical Laboratory.

The members of the Committee paid a visit to the Technological Laboratory of the Indian Central Cotton Committee at Matunga, the Haffkine Institute, Parel, and the Department of Chemical Technology, Matunga.

Facilities for Training at the Technological Laboratory, Matunga, Bombay.—As in the past, the Technological Laboratory of the Indian Central Cotton Committee at Matunga, Bombay, will admit this year a maximum of four students for training in the elements of spinning and routine methods of testing cotton fibre and yarn. Preference will be given to those employed in the cotton trade or textile industry who must at least be matriculates of a recognized university; for others minimum qualification intermediate in science. The selected candidates will be expected to join on the 22nd January 1945 and will work from 10 a.m. to 5 p.m. (with half hour's break for lunch) on week days and from 10 a.m. to 1-30 p.m. on Saturdays. The course will normally last for a period of six months and a fee of Rs. 50 only, which is not refundable, will be charged for the full course.

Candidates should submit written applications to the Director, Technological Laboratory, Matunga, Bombay, so as to reach him not later than 9th December 1944.

All-India Bobbin Manufacturers' Association, Bulsar.—At the request of many bobbin manufacturers in India Messrs. S. M. Pandit & Co., proprietors, Hind Bobbin Works, Bulsar, have organized an All-India Bobbin Manufacturers' Association and it was declared open by Mr. Nalin Bhatt, M.A., recently.

The objects of the Association are to protect and promote the bobbins, shuttles, and other textile wooden industries in this country, to promote and defend the trade of its members against competition, to arbitrate on the matters of disputes, to get the enactment of legislation beneficial to the trade and secure protective tariffs and facilities for transportation, to organize research on plants and machineries for standard production, and to carry out research on all raw materials used in this industry, and survey other natural resources for the development of the business and collect statistics for circulation among members and to establish a technological institute of bobbins and shuttles in India. The organizers appear to be making arrangements to establish the head office of the Association in Bombay.

Workers' Enforced Idleness: Need for Compensation.—The need for taking immediate steps by the Government of Bombay to make provision for the payment of adequate compensation to workers for the period of enforced idleness by introducing a scheme, in consultation with the Bombay Provincial Trade Union Congress, was stressed in a resolution adopted at a special conference convened by the B. P. T. U. C. at the Servants of India Society, Bombay.

The conference viewed with grave concern the involuntary unemployment that was occasionally forced on sections of industrial workers in some parts of the province, such as Khandesh and Gujerat, on account of stoppage of factories or industrial concerns for want of coal or raw materials or for other reasons. Such stoppage of work caused great hardship to workers, especially at a time when the cost of living had gone up enormously.

By another resolution the conference expressed the view that the proposals embodying principles for granting compensation for involuntary unemployment, which the Government of India recommended to the Provincial Government, were defective and fell short of reasonable expectations.

Foreign

Indian Textiles for China.—The Chinese members of the U.N.R.R.A. Council at a Press Conference said: "Among the items for relief which China is expected to get are some quantities of textiles from India, rice from Burma, Indo-China and Thailand." Asked if it might be foreseen that China would some day be sending food to India, he said he did not anticipate any such thing.

Australian Wool Fabric Printing Industry: An Encouraging Development.—A bright future for the Australian wool fabric printing industry is predicted by the Australian Wool Board. Printing consists of drawings, paintings of various subjects and coloured designs, developed from pictures, on a wide range of cotton and woollen fabrics for clothing, curtains and upholstery. It is said that a vast improvement has been made in the standard attained by this branch of Australian industry which is very encouraging to wool interests.

Universal Rise in Prices: Living Costs.—A world-wide increase in wholesale prices and the cost of living has taken place since the war began, as will be seen from the following League of Nations indexes for certain selected countries, showing figures at the end of 1943 or in the early months of 1944 (January-June 1939=100):—

Country	Wholesale prices	Cost of living
Iran	508	772
India	301	236
Egypt	280	255
Finland (Nov.)	256	200
Portugal (Nov.)	228	161*
Peru	209	152

Norway	180	152
Sweden	179	142
Mexico	172	176*
United Kingdom	169	130
Union of South Africa (Nov.)	154	125
Japan	147	143
Canada	140	118
United States	136	125
Australia	138	122†
Germany	109	111

* Excluding rent.

† Average September–December 1943.

Reverse Lend-Lease in India.—The volume of reverse Lend-Lease aid provided to United States forces in India has gone up by leaps and bounds. In January and February of this year alone American troops received over $35,000,000 worth of supplies. This was as much in two months as we had received in the entire year of 1942 and half as much as we had received in the entire year of 1943.

Reverse Lend-Lease aid furnished to the United States in India up to 1st March 1944, totalled almost $150,000,000. This came to us without payment on our part and saved many thousands of tons of shipping space. Petroleum products, including aviation gasoline from the British refinery at Abadan for the United States Air Forces in India, make up a large part of the total.

Other supplies received in the two months of January and February 1944, alone, included:—6,800,000 pounds of vegetables, 170,000 pairs of socks, 300,000 yards of cloth, 175,000 pairs of trousers, 700,000 gallons of Diesel oil, 200,000 sets of underwear, 4,000,000 pounds of meat and fish, 2,000,000 pounds of fruit, 1,000,000 pounds of beverages, 500,000 pounds of bread and 700,000 dozens of eggs.—*Foreign Commerce Weekly.*

Insect Eggs Flown to United States to Safeguard Vital Cotton Crops.—Cotton, from which comes the cloth to clothe Allied invasion troops in Europe and around the world (as well as stylish women) is going to be saved from the ravages of the dreaded cotton leaf worm—that is, if two types of warlike parasites, now busy setting up their own beachheads on southern cotton plantations, have their way. Recently a shipment of countless insect eggs from which the "good" parasites later were to hatch were despatched from Tucuman, Argentina, under Government priorities by fast airplane destined for infested areas in the Southern United States.

It is expected that promptly on hatching the mites will begin their deadly work against their avowed enemy, the *Alabama Argillacese*, scourge of cotton planters.

Earlier this year Harry Parker, an entomologist of the U. S. Department of Agriculture and the South American Parasite Laboratory, arrived at Tucuman in northern Argentina by plane to collect specimens of the two types of parasites that Ing. Guillermo Kreibohn de la Vega of Tucuman had discovered were lifelong enemies of *Alabama Argillacese.*—*Foreign Commerce Weekly.*

Fifty Years Ago

(From the *Indian Textile Journal*, November 1894)

An Early Appreciation

"The *Indian Textile Journal* will compare favourably in point of printing and general get-up with the best English and American publications of its class, while the support it has received from subscribers in this country and other manufacturing countries in the East shows that, as regards quality and originality of reading matter, too, it has taken a place in the front rank of technical periodicals. The display of advertisements gives the *Journal* a healthy look and the work is beyond doubt useful as an advertising medium for mill machinery . . ." —*The Bombay Gazette*, 31st October 1894.

Re-equipping Indian Mills

WRITING the other day on the inadequacy of the present depreciation allowances for the task of post-war renewals and replacements of textile machinery, we suggested that about 50 per cent. of the entire spinning and weaving plant in India would call for replacement in the first 5-10 years after the war. There are 10 million spindles and 200,000 looms in the Indian cotton textile industry, the total yarn production being absorbed in the manufacture of 6,500 million yards (including 2,000 million yards on the handloom). It is believed that in order to maintain the present volume of cloth production, about 3.3 million spindles and 50,000 looms, with dyeing, bleaching, printing and finishing machinery in proportion, will have to be replaced in the first five years after the war. The present volume of production allows, however, a reduced *per capita* consumption of only about 12 yards and, if this *per capita* consumption is to be raised to at least 18 yards, India would require about 7,200 million yards, in addition to about 800 million yards for export. But, as the present yarn production of 10 million spindles suffices to produce only about 6,500 million yards of cloth about 2.4 million additional spindles and 68,000 additional looms might become necessary to produce the difference of 1,500 million yards between the present production and our ultimate objective.

According to an authoritative analysis made last year, there are in India about 4,500 blow-room machines, 24,000 revolving flat carding engines, 20,000 draw and speed frames and 22,000 ring spindles. Of the blow-room machinery 11.5 per cent. was installed before 1890, 11.1 per cent. between 1906 and 1910, 18.6 per cent. between 1921 and 1925 and 11.4 per cent. between 1936 and 1940. Thirty-five-and-a-half per cent. of the draw and speed-frames was installed before 1910 and 21.8 per cent. between 1921 and 1925 while ring frames showed a similar trend.

What, it might be asked, is the position regarding the replacement programme of Indian cotton mills? Cotton textiles occupy a pre-eminent place among Indian industries, and the Department of Industries and Civil Supplies, Government of India, has always attached great importance to their rehabilitation after the war. Preliminary discussions were held early in the year when it was decided to draw up a business-like statement indicating the general requirements of the industry. Such a statement was prepared by the Millowners' Association, Bombay, as the result of a questionnaire issued to its member-mills and it is believed to have reached the Government of India some months ago. At the same time, Indian mills have been informed that they had full liberty to arrange for the satisfaction of their requirements in any manner they chose and that they could place their orders wherever they chose, whether individually, or through the Textile Control Board, or through the millowners' associations. The Chief Controller of Imports will examine applications for machinery and arrange for its importation, mostly from the United Kingdom and countries of the sterling bloc. Although, therefore, the Government of India have no idea of canalising the orders, it is laid down that the orders should first be registered with Government and be automatically confirmed if not objected to by the latter within three months. The importer will have to submit a report to Government as soon as an order is confirmed and, if no report is received within six months, the order will stand cancelled automatically. The Government of India propose, further, to set up buying organizations in England and America to help the industrialist to secure the goods he wants.

While this is all to the good, Indian millowners are eager to know what arrangements, if any, have already been arrived at with England and America regarding priorities and where India stands *vis-a-vis* other textile machinery importing countries. Have the Government of India ascertained the volume and types of machinery that England and America could spare in, say, the first five years after the war ? It has so far been the practice to place orders for plant and equipment with manufacturers' representatives stationed in India, and in several cases even advance deposits have been paid in order to secure priority ratings. If the Government of India do not desire to disturb existing trade channels, will these priorities be honoured and will arrangements be made for the refund of the deposits? If so, the purchasing organizations which the Government propose to open in England and America, or, for that matter, even the joint organization suggested by Mr. T. Maloney* should be having little to do. Especially is this so when we bear in mind the strong individuality of Indian cotton mills and their reluctance to act as a team in affairs of this kind.

The bulk of India's machinery needs has for a variety of reasons been long met by England, and developments in the English machinery market should, therefore, be of more than passing interest ; we refer to the recent publication of the report of the Platt Mission to America and the current controversy in a section of the Press in England which focussed popular attention on the alleged backwardness of English textile machinery as contrasted with corresponding American makes. Everybody realizes, however, that the report of the Platt Mission to U.S.A. deals only with comparative production per man-hour without taking into account differing costs of production and other changing circumstances. According to authoritative American opinion, what Lancashire may appear to lack in machinery it has more than made up by the specially fine quality of its textiles ; as a matter of fact, in 1937 America itself took £750,000 worth of Lancashire textiles despite her high tariff wall. All the same, it is being said that American textile machinery is better than Lancashire machinery. In the course of the controversy on this subject, Mr. A. W. Rippon, of Textile Machinery Makers, Ltd., refutes the popular allegation and points out that new processes like single process lap making†, large package spinning, individual motor driving and high drafting have been supplied all over the world by Lancashire machinists for several years.

However that may be, there is bound to be a great shortage of textile machinery in the immediate post-war period even in countries manufacturing textile machinery on a large scale. In countries, on the other hand, which have been importing their textile machinery and accessories the position will naturally be much worse.

Manufacturing capacity being practically concentrated in America and England, the textile industries of those countries are likely to be given first preference. There is, besides, a section of opinion that regards exports of new textile machinery as being tantamount to subsidizing foreign competition in the finished product with the domestic producer. But the British Government have more than once given expression to their realization of the importance, in England's own interests, of the export trade in textile machinery. All the same the full satisfaction of India's requirements may be rather difficult, and some degree of international co-operation and co-ordination between machinery producing and exporting countries may be necessary. In the meanwhile present indications would seem to show that the situation in the immediate future will be met by the supply of new output for essential domestic and export demands and of second-hand and re-conditioned machinery where it is adequate for the purpose, and by establishing the machinery manufacturing industry in countries where the demand promises to be sustained and broad-based. It was reported the other day that certain Indian cotton mill interests were negotiating for the shipment of 20,000 old ring spindles from Lancashire to India and that similar transactions are expected to follow. Unilateral attempts, however, to liquidate India's sterling balances by the supply of re-conditioned machinery may be more or less resented in this country. In 1943 India imported about a third of the volume of textile machinery from England as it did in 1938, but paid about as much for this reduced volume as it did in the latter year; in other words, prices have gone up by 300 per cent. In these circumstances it becomes the special responsibility of the Government of India to arrange for the fixing of equitable prices for the machinery, new or re-conditioned, that India may require from England, and to provide adequate dollar exchange for purchases from America also.

British and American Cotton Mill Industries

Comparative Study Yields Interesting Results

American Machinery on Top?: British Textiles of Superior Quality

The Report of the British Cotton Textile Mission to the United States of America has been an eye-opener to everybody. It is divided into the following four parts: Part I—A comparison of production per man-hour in the U.S.A. and U.K. in spinning, weaving and preparation. II—A general review of industrial organization, machinery features, processing practices and working conditions in U.S.A. and British cotton mills. III—Review of management and labour. IV—Recommendations for the increase of labour productivity in Britain.*

After indicating the enormous leeway that has to be made by Lancashire in order to equal America's production per man-hour the report proceeds to examine the reasons for the higher American production per man-hour. It believes that man for man the British worker can be as efficient and productive as his American opposite number, and that the unsatisfactory production figures of Lancashire are due solely to mechanical handicaps, which the industry has since been planning to overcome.

"IN the course of discussions in Washington about the requirements of the United Nations for cotton goods, it has become plain that it will be difficult to maintain supplies at a level which will enable essential needs to be met. It is impossible to allot more labour and capacity to cotton, but it has been suggested that in spite of this it may be possible by suitable adjustments of methods to increase production here without further call on labour, and that a study of the methods used in the United States would be helpful in enabling us to do so.

" It is proposed, therefore, that a small mission led by the Cotton Controller should go to the United States to investigate and report on the methods used in the cotton industry there, and to advise on any changes in method that could be usefully made here."

These were the terms of a letter received by each member of the British Cotton Textile Mission to the United States of America, who unhesitatingly accepted the responsibility, from the Minister of Production, the Right Honourable Oliver Lyttelton. Throughout the whole of the visit these terms of reference were rigidly adhered to. It was to be purely a question of production per man-hour, and thus, costs of production not being a subject for the mission, the questions of comparative wage rates were not investigated. As every member of the mission, however, has spent the whole of his working life in the Lancashire cotton industry, it is obvious that the information gained in respect of the volume of production would, with the information gained in general discussions on operatives' earnings, give some rough and ready views on the comparative costing results. From that standpoint, therefore, the members of the mission did formulate their own views on the relative positions of the two industries.

The following were invited by the Minister of Production to make up the Investigating Mission:—

Sir Frank Platt: Cotton Controller, Ministry of Supply, formerly Managing Director of the Lancashire Cotton Corporation Limited.

Mr. Eric Cartwright: Director of Cloth Planning, Ministry of Supply, Cotton Control. Manager of Messrs. Fothergill and Harvey Limited, Spinners and Manufacturers.

Mr. Arthur Hollas, J.P.: Chairman of the Bolton Manufacturers' Association, and Director of several cotton spinning and manufacturing concerns.

Mr. Andrew Naesmith, O.B.E., J.P.: General Secretary of the Amalgamated Weavers' Association and of the Northern Counties Textile Trades Federation.

Mr. Alfred Roberts, J.P.: General Secretary, Amalgamated Association of Card, Blowing and Ring Room Operatives.

Mr. Horace Spibey, M.Sc. Tech.: Lecturer, Manchester College of Technology.

* Published by the Ministry of Production, United Kingdom, and printed at His Majesty's Stationery Office London.

We are indebted to the Controller of His Majesty's Stationery Office for permission to publish the Report in the *Indian Textile Journal*.

Mr. John Walsh, B.Com.: Managing Director, Goyt Spinning Company Limited. President of the Manchester Cotton Association Limited.

The objects of the report which the mission has since submitted to Government are:—

(1) To ascertain and compare the productivity of labour employed in the cotton spinning and weaving mills of U.S.A. with that of labour employed in similar British mills,

(2) To account for any differences between the two,

(3) To compare production methods of typical American and British spinning and weaving mills producing similar type yarns and cloths, and

(4) To make recommendations for the increase of labour productivity in British cotton spinning and weaving mills.

Conclusions

(*a*) With normal staffing British p.m.h. (production per man-hour calculated on the basis of total output and total labour force) is less than the American by approximately 18 to 49 per cent. in spinning, by 80 to 85 per cent. in winding, by 79 to 89 per cent. in beaming, and by 56 to 67 per cent. in weaving.

With present conditions of staffing and fully running plant it is estimated that the British p.m.h. is less than the American by approximately 3 to 48 per cent. in spinning. The percentages for winding, beaming, and weaving are estimated to show no significant change from those given for normal staffing.

(*b*) For a given output considerably greater labour forces are required in the British mills.

With normal staffing the British labour requirements exceed the American by approximately 22 to 98 per cent. in spinning, by 387 to 571 per cent. in winding, by 366 to 786 per cent. in beaming, and by 129 to 203 per cent. in weaving.

With present conditions of staffing and fully running plant it is estimated that the British labour requirements exceed the American by approximately 12 to 63 per cent. in coarse and medium count spinning, whilst in fine spinning they are less than the American by approximately 5 per cent. The percentages for winding, beaming, and weaving are estimated to show no significant change from those given for normal staffing.

(*c*) The main reasons for the higher American p.m.h. are:—The use of high-draft, high speed, and automatic machinery wherever possible; the use of up-to-date plant (large sums of money being expended for this purpose); the application of scientific methods to the utilization of labour, which permits a relatively large number of units or machines to be supervised by a machine operative; the policy of concentrating on high operative efficiency (in terms of output), in many cases at the expense of machine efficiency; and the lower age of the operatives.

(*d*) Integration of the spinning, weaving and finishing processes has progressed to a much greater extent in America than in Britain, the processes operating on standardised and bulk productions for use, mainly in the home market. This system of bulk production makes possible the use of high speed and automatic machinery (particularly in preparation and weaving) which works on a three-shift basis, each of 48 hours per week.

The British mills, on the other hand, work one shift of 48 hours per week, are organized horizontally and, catering for both home and foreign markets, produce a wide range of products to meet the large variety of cloth types prevalent under the British commercial system. The sales made are both varied and small, and do not permit the economical use of highly productive automatic machinery.

(*e*) American processing practice, based on the continuous production of standard counts of yarn and cloth types, permits standardization to be applied to plant, processing methods, and labour, and is conducive to high standards of efficiency, organization and output.

In Britain, frequent changes in yarn counts and cloth particulars disturb the balance of plant and labour requirements and in many cases prevent the establishment of the optimum conditions for high production efficiency.

In quality the American standard of processing, generally, is slightly lower than the British, mainly due to a concentration on matters of engineering and organization, to the bulk production policy, to the reduction of processes to a minimum, and to the large number of units or machines supervised by an operative. The potentialities of staple and twist are, however, more fully appreciated in the American spinning and weaving industry, particularly with regard to their effects on labour force requirements.

Particular features of American practice, which do not apply generally in British mills, are the use of large packages such as cans, bobbins, beams, etc., the large-scale use of high drafting in card and spinning rooms, and the use of control devices in slasher sizing.

(*f*) American management has greater scope than British management in its utilization of labour because of the comparative absence of long standing practices and conventions and because of the acceptance by labour of scientific methods to matters of Work-assignment. The duties of an operative and the number of units or machines supervised are based on a work-load assessment which allows an operative a certain percentage of free or "idle" time. This time allowance will vary with the type of work on which the operative is engaged and may range from 10 to 20 per cent. There was no evidence of overloading of the operatives in American mills in spite of the greater number of machines supervised by them as compared with corresponding British operatives. On the basis of these work-load assessments wage rates are established.

(*g*) American mill managers, generally, are young and analytical and progressive in their outlook.

Recommendations

In making recommendations for the improvement in p.m.h. in Britain, it is necessary that any immediate or short-term re-equipment plans should be made with due regard to long-term plans. These short and long-term plans should be correlated and permit, as far as possible, a smooth economic integration, and should be prepared with the following basic objects:—

(1) To permit a higher degree of standardization and specialization, thus giving uninterrupted bulk production.

(2) To improve the standard of technical equipment in mills.

(3) To improve the working conditions in cotton mills.

(4) To secure a greater degree of co-operation between spinners and weavers, thereby raising the level of production efficiency.

(5) To provide a more scientific training for management.

(6) By the application of scientific methods to spinning and weaving practices and to the utilization of labour, and by the use of the most modern plant, to provide conditions which permit greater labour productivity and economy in production costs, and at the same time permit a higher level of wages for the operatives employed.

The short-term measures which may be adopted to comply with the immediate requirements of such a programme are limited but the following recommendations may be made:—

(1) The greater use of high drafting in both ring and mule spinning.

(2) The greater use of high drafting in card rooms.

(3) The use of larger cans in card rooms.

(4) Closer working arrangements between spinners and manufacturers.

(5) The use of slasher control systems and higher speed slashing.

(6) The greater use of automatic drawing and knotting machines.

(7) Where practicable, increasing still further the number of looms per weaver, necessitating a greater application of larger yarn packages, warp stop motions, automatic let-off motions, etc.

(8) A greater sub-division of weavers' duties.

(9) Wider loom spacing.

(10) The use of high speed shearing and planting machines.

(11) Greater economy in the utilization of labour by permitting operatives to supervise more units or machines, where practicable.

(12) Improvements in internal mill conditions by the greater provision of runways, improvements in lighting, etc.

The above recommendations constitute the short-term plans. To lead to the fulfilment of the long-term plans certain recommendations are made for changes in the methods of distribution, for the modernization of the industry on the basis of man-hour production, and for conducting defined investigations within the industry.

American Mission Visits England

Subsequent to the visit of the Platt delegation to America, the Government of the U.S.A. sent a cotton textile mission to England with the object of assisting the War Production Boards of the two countries in co-ordinating the work of meeting their textile needs. The mission consisted of the following:—

Messrs. G. H. Lanier, Jun., Director of the Cotton and Synthetic Textiles

Division, United States War Production Board, who before the war was a dyer; T. M. Bancroft, Assistant Director of the Textile Clothing and Leather Bureau, War Production Board, and Vice-President of the Turner-Halsey Company, New York, distributors; W. S. Montgomery, President of Spartan Mills, Spartanburg, South Carolina, and Vice-President of the American Cotton Manufacturers' Association; J. H. Bolton, Vice-President of the Whitin Machine Works, makers of textile spinning machinery; and W. F. Lowell, Vice-President of the Saco-Lowell Shops, who also make textile spinning machinery. They had a busy time visiting all branches of the Lancashire cotton textile industry and expressed themselves well pleased with all that they saw.

In an interview Mr. Bancroft said:—

" While we have been here we have seen every section of your cotton industry, from the handling of the raw cotton to the merchandising of the manufactured and finished goods. We have found points of similarity to our own and others of dis-similarity, and the way everyone has answered our questions, without any reservation, has warmed my heart. As you know, your mission under Sir Frank Platt recently visited our country and we hope that this interchange of ideas will be kept up. We shall present our report to our War Production Board, just as Sir Frank has done to your Board.

"In this country your industry is organized quite differently from ours. Your spinning, weaving, finishing, and merchanting are done separately. We do the whole thing in one. On the average our units are smaller than yours. We have hardly any with more than 100,000 spindles, and though we have combines controlling larger figures some of your combines are bigger than ours. But for the type of consumer for which we cater, for the most part in the mass at home, our type of organization is the better. On the other hand, if we had to cater for a 75 per cent. export our organization would not satisfy the markets; our vertical organization would have to go. Distance has a great deal to do with it also. There are 1,500 miles between our northern and our southern mills."

Mr. Montgomery expressed his agreement with Mr. Bancroft's views on the need for different organizations.

" One thing we have noticed," "he added," is the difference in the quality of the cloth produced. The quality of your cloth is very much finer than ours, and I think you have a real market in America for your finer types. We have practically no mule spinning in America. I know of only two mills with mules. I should not agree with anyone who said that the mule was out of date for Lancashire. Here you give your goods more individual treatment. There is much more specialization. You are more concerned with quality than with quantity. I have been impressed also with the care given to your machinery. It is quite exceptional. I went through one mill which has been closed down under concentration for three years. It looked just like having been shut down yesterday. One overlooker said he could restart with 24 hours' notice. I was also told that some of the employees out of loyalty to their mills are keeping the machinery up to the mark in their own time, without pay."

American Textile Interests Criticise Export of Textile Machinery ?

WHILE approving with reservations the war surplus disposal plan as proposed by Foreign Economical Administrator Mr. Leo T. Crowley, American textile exporters indicate that they would oppose vigorously any programme to ship large quantities of textile machinery to foreign producers.

They believe that considerable harm to American traders would result if war surpluses are sent abroad at prices cheaper than manufacturing costs plus a reasonable profit in that it would be difficult to make sales at a later date.

If surplus goods are sold direct to foreign Governments through buying commissions, rather than through accredited exporters, re-establishment of trade relations after the war will be retarded by many months, if not years, and will deprive foreign importers as well as American exporters of profits for which they have waited a long time, it is stated. Any large quantity of surplus goods would reduce proportionately the quantity of new manufacture sent by American manufacturers to export markets, it is stated, and fair play calls for the opportunity of traders to share in the business.

Shipment of textile machinery abroad in line with rumoured Lend-Lease plans before American needs are filled would be doubly harmful, according to the exporters. Not only will American manufacturers be unable to replace worn-out and outmoded equipment which prevents them from supplying domestic users of textiles at the most economical prices, they say, but such a move will give foreign producers an almost immediate opportunity to capture world markets at a time when U.S. will need this business to keep her own post-war economy steady.—*Textile Mercury and Argus.*

Cloth Distribution in Wartime

Post-war Possibilities of Current Experiments

By P. C. JAIN, M.A., M.Sc. (Econ.) London, *University of Allahabad*

(*Specially Contributed*)

THE war has familiarized the Indian cotton textile industry with new methods of distributing cloth and these are likely to have interesting repercussions in the post-war period. Under the new scheme introduced by the Textile Control Board, cloth is supplied direct from mills to the retailers thus eliminating a whole series of intermediaries. This scheme is yet in its infancy but there is no doubt that it will soon be extended and, moreover, it is expected that a further refinement will be introduced when the market is divided into different regions and the retailers in any particular region are supplied only by some specified mills. This is bound to result in the creation of definite "areas of influence" for each mill. The Textile Control Board has sponsored this scheme with the only object of eliminating black markets and making price control effective. It is easy to control the behaviour of a few licensed retailers while it is almost impossible to keep under control a host of middlemen many of whom work underground. This scheme will help in eliminating black markets but this is a small affair as compared to the possibilities which it opens up of improvement in peace-time distribution of cloth.

Old Channels of Trade

The wholesale cloth dealer, like his prototypes in other trades, performs two very important functions. He buys cloth from the mills and finances its movement from the producer to the consumer and, secondly, he provides the retailer with an easily accessible source of supplies. The producer gets paid and washes his hands of the transaction and does not bother at what price and how soon the wholesaler is able to dispose it of. The wholesaler, of course, will not repeat his orders unless the consumer, through the retailer, shows his preference for a particular make of cloth. It is, therefore, only indirectly that the producer keeps himself in touch with changing tastes of the consumer. The wholesaler provides no information to the mill on this point. He follows the line of least resistance and buys cloth, foreign or Indian, which sells quickly and leaves him a fair margin of profits. This often puts the Indian manufacturer at a disadvantage as compared to the Japanese or English producer. The Japanese producer has been able to supply cloth, quality for quality, at very cheap prices and this gives the wholesaler a better margin of profits as the low wholesale price permits him to sell quickly as well as to add to the price a higher percentage as his own share. In the case of British cloth, the quality considerations and the unfounded belief in most Indian consumers that British goods are always of high quality enable the wholesaler to effect a quick turnover of goods and charge a higher margin as his own profits. The consumer prefers to buy British cloth even if a higher price is charged because of his prejudices.

The Wholesale Dealer and His Future

This system, therefore, has some very awkward consequences for the Indian manufacturers. There is not only one wholesaler but a series of them and a piece of cloth passes through many hands before it reaches the retailer and through him the consumer. Each wholesaler adds his margin to the price and in this way the retail price of cloth is unduly increased. We have already noticed that the foreign producer is not much handicapped by this enhancement of prices but it is different with the Indian cloth which consequently suffers in its competitive power. Moreover, because of his being separated from the consumer the producer of cloth feels helpless and, apart from occasional advertisement in the Press, can do nothing to popularize his goods and increase their sales. The manufacturer of cloth might quote lower prices for his lines but that does not necessarily reduce prices for the consumer because the series of wholesalers between him and the consumer is likely to swallow this reduction. What is worse, the manufacturer has no means of studying consumers' tastes and often he either copies foreign designs or introduces a large number of new designs originating from the mind of the artist and without much sense of reality. This leads either to a lack of originality or an excessive multiplication of types and designs leading to the manufacture of cloth on a small scale in the vain hope of capturing the market. The net result, however, is a further complication of the situation. If the wholesaler is eliminated the price to be paid by the consumer will be reduced and it would give to the producer an opportunity of coming into closer touch with his "market." The elimination of the wholesaler is likely to cause some inconvenience and confusion in the beginning so far as the producer is concerned. But an adjustment to the new situation will quickly be achieved and the botheration is worth taking in the interest of pushing sales and developing the market on scientific lines. The problem of financing the movement of goods will not cause as much trouble as some would make us believe. Even now the producer has often to grant the wholesaler liberal credit facilities and, apart from this, the necessary finances can easily be arranged either through banks or by increasing the working capital.

Need for Centralized Organization

The elimination of the wholesaler alone is not enough. The process of controlling the sales will have to be further extended and the best policy for the cotton textile mills is, by mutual agreement, to divide the internal market into definite regions allotted to specified mills so that there might be no cut-throat competition, at least among the Indian manufacturers. In this division of markets care will have to be taken of the transport costs and the types of cloth and yarn produced by the different mills. It would be a sound policy to allot the nearest market, or if there are many producers to divide it between them, to a particular mill if it manufactures the lines in demand in that area. There will, of course, be some areas producing more cloth than they can consume and others which have a short supply. But it should be perfectly possible to allot deficit areas to distant mills which are unable to obtain a market in their own locality. It shall be equally possible to adjust the supply of certain special types of cloth and yarn produced by only some mills. These specialities might be rationed, on some definite basis, between the different regions. Such a scheme will prevent unhealthy competition among Indian manufacturers and enable them to come together for joint action. And on the basis of this joint effort it should be possible to stem the tide of foreign competition at least so far as the Indian market is concerned. It will also prevent unnecessary movement of cloth, thus saving transport and other handling costs. Each producer will have a clearer idea of the possible market demand on which he might rely. This would prevent over-production and the consequent evils. But in order to make this scheme successful a centralized organization will have to come into existence. It would also help member mills in various other ways such as research, centralized purchase of raw materials, chemicals and dyestuffs, and joint representation.

The Retailer and His Future

A further extension of this scheme will involve a control on the retailer as well. At present the retailer sells imported cloth alongside the Indian cloth and he is indifferent as to which sells more. He is interested only in his profits. It often happens that even if the consumer is prepared to buy Indian cloth the advice of the retailer leads him to buy the foreign stuff. The name of Lancashire still works magic on some consumers who are prepared to buy British-made cloth even if, quality for quality, the Indian cloth has the same price or is cheaper. This pitiable state of things will end if, like the Delhi Cloth Mills, the other manufacturers also open retail shops, to begin with, at least in the bigger towns. Alternatively they might exercise a definite control on the retailer, as is done by the manufacturers of certain other commodities in our country. The Indian textile manufacturers have so far been helpless because they have not exercised such extensive supervision and control. They could somehow pull on in the past but times have now changed and this extension of activities is necessary for bare existence. The shops opened by the Delhi Cloth Mills have given great satisfaction to the consumers and have pushed the sale of D.C.M. products. The experiment has been successful and deserves a wider application.

The Export Market

The distribution of cloth in the foreign markets is as yet thoroughly unorganized. A portion of the exports is handled by the manufacturers themselves while a major part of them passes through the hands of Indian exporters. But even where the manufacturers undertake exports they do nothing more than deliver the cloth to the merchant in the importing country. No effort is made by them to study consumers' tastes in foreign markets. No care at all is taken of the quality of goods supplied or the packing and markings of bales of cloth intended for export. The manufacturer in India does not know and does not care to know the price at which Indian cloth is sold in foreign markets. His job is done if the importing merchants or the wholesalers in foreign countries place orders for his goods and pay him. The Indian producer has not yet fully realized the possibilities of the export market though the war has given him some idea of what it can yield. In the last few years the world's textile manufacturing capacity has considerably expanded and, in spite of some destruction of capacity in war-zones, with the cessation of hostilities we should expect cut-throat competition to return more quickly than most of the industrialists seem to believe. And in order to take time by the forelock the Indian manufacturers have to prepare themselves to face the ordeal.

The Cloth and Yarn (Export Control) Order, 1944, makes some effort at improving the situation. It fixes price margins, over and above the ex-mill rates, both for the manufacturer-exporters and the exporting merchants with the object of controlling prices. It is desired to make Indian cloth available to the foreign consumers at not more than 30 per cent. over the ex-mill rates. This would only solve the war-time problem but it is equally necessary to ensure that the foreign consumers continue to get Indian cloth at competitive prices even in peace-time. This should claim immediate attention on the part of Indian manufacturers. The Order lays down certain minimum standards about packing and markings on packets intended for export. This, if properly enforced, will remove a longstanding complaint of importers in foreign countries. The quality of cloth supplied to the foreign market will also be supervised. A part of the money raised from the 3 per cent. export duty on cloth will be spent on research and advertisements aimed at popularizing Indian cloth. These are fine intentions but in order to make them effective a far larger amount of money will have to be spent than the export duty can yield and the export control organization will have to be set up on a permanent basis. It is a pity that the Textile Control Board refuses to look beyond the war period. At present it may be urgent to restrict the exports of cloth to 600 million yards per annum and to control the prices of exported cloth but, from a wider point of view, the most urgent need of our expanded cotton textile industry is to hold as much of our foreign markets as we possibly can even when peace returns. It is only bold action on the part of the Indian cotton textile manufacturers which can save the situation.

Geelong Textile College, Australia

THE Textile College to be built in Geelong will serve Australia and is being established primarily for the student who wishes to do the advanced course, i.e., training for managerial staff and technological posts. It will deal with wool, cotton, silk, flax, and synthetic fibres, with the emphasis on wool. The departments of the Wool Section will be wool classing and sorting; scouring and carbonizing; woollen yarn production; worsted yarn production; weaving yarn production; dyeing and finishing; and research and testing. The first two and the last departments exist at present and are in operation.

Advanced courses to the standard of the Leeds University and Bradford Technical College Diplomas will be given, with special courses designed to meet the special needs of the industry.

The courses and syllabus are, of course, under discussion, but finality has not been reached. The smaller number of mills in Australia, the distances involved, etc. will modify the courses in many respects, compared with British textile education.

Cotton Standards in the Madras Presidency *

By J. S. PONNIAH, M.A., *American College, Madura*

(*Specially Contributed*)

ONE of the most difficult problems in the organization of efficient marketing of raw cotton in India is the establishment of suitable grades and standards with a view to facilitating quick purchases and sales and accurate quotations of prices.

The cotton standards established by the East India Cotton Association are followed only in the two cotton exchanges of Bombay and Karachi, and it is doubtful whether they would be adopted as " the universal cotton standards " of India (as indicated by their name) in all the spot cotton markets scattered all over the country.

The Agmark Cotton Grading Scheme of the Government of India under the Agricultural Produce (Grading and Marking) Act of 1937, intended to enable the growers of improved varieties of cotton to obtain adequate premium for purity and quality, unfortunately enough, has had only a limited success in the case of cottons like 1027 A.L.F. and had even to be given up in the case of Cambodia cotton at Tiruppur in the Madras Presidency.

Though the prospects for the general adoption of the " universal cotton standards " of the East India Cotton Association or the Agmark Cotton Grading Scheme of the Government of India are not bright, it is indeed refreshing to learn that the cotton trade in the Madras Presidency, particularly in the three southern districts of Madura, Ramnad and Tinnevelly, has actually evolved during the past quarter of a century and is also enforcing even to-day certain grade standards for the local cottons. It may be added that though these standards are of a purely local character and imperfect in several respects, they are capable of improvement and lend themselves to permanent adoption by the trade as a whole, provided the Government takes the necessary initiative and introduces suitable legislation. The following account is intended to give an idea of the evolution of these local cotton standards and the problems involved in their enforcement by the Government.

Cotton Standards in the Madura Area

The history of the evolution of cotton standards in the three southern districts of Madura, Ramnad and Tinnevelly (Madura Area, for short) may be traced as far back as about 1890 when European exporting firms, like Ralli Bros. and Volkart Bros., started their business of cotton buying in this area, and adopted a system of buying entirely on the basis of " grades " even from the very commencement of their business. In fact, some standard or other was absolutely essential as the firms were buying cotton on a forward contract basis. The grade adopted was what is known as f.a.q. (fair average quality). Such a simple grade standard was sufficient at that time because there was only one variety of cotton, namely, Tinnies, and its quality did not show appreciable variation from season to season. Hence it was sufficient for the firms to stipulate merely delivery by sellers, of cotton of fair average quality of the season as the tenderable cotton against their forward contracts.

Though the standard denoted by the phrase f.a.q. was vague, both buyers and sellers were generally agreed as to the exact quality denoted by it. A local witness described the working of this system in the following terms in the evidence placed by him before the Indian Cotton Enquiry Committee of 1919:—" When the season was normal and the market steady, the dealers delivered according to quality agreed upon; but when unseasonable rains reduced the crop or when sharp rise of prices occurred, there was a tendency to deliver cotton below grade."

It was pointed out by certain other witnesses who appeared before the same Committee that on account of severe competition amongst themselves, the exporting firms were reluctant to penalise deliveries below grade by lowering the prices or by paying premium for deliveries above grade but resorted to paying only a uniform price for good as well as inferior grades. The sellers being unorganized were also not able to enforce their claims for premium when they delivered cotton above grade. Further, there was no public tribunal to settle any dispute arising out of grade claims.

---

* Summarized from the author's thesis, " Production and Marketing of Cotton in the Madras Presidency," which was recently approved by the University of Madras for the D.Litt. degree.

Partly on account of the difficulties explained above, and partly on account of the introduction of Karunganni and Cambodia which brought in new grade qualities, the European exporting firms were obliged to adopt a different set of standards for buying cotton in this area. Messrs. Ralli Bros., who were pioneers in this, are said to have set up in 1917 the two following standards which recognized nine grades for each of the three varieties of cotton, namely, Tinni, Karunganni and Cambodia. Each grade was designated by a number with a view to facilitating its easy identification by traders.

TABLE I

Cotton Standards of Messrs. Ralli Bros.

(A) TINNI AND KARUNGANNI

1. Good. 2. Strict Good. 3. Barely Good. 44. Fully Good Fair. 4. Strict Fully Good Fair. 55. Barely Fully Good Fair. 5. Good Fair to Fully Good Fair. 66. Good Fair. 6. Strict Good Fair.

(B) CAMBODIA

77. Fully Good Fair. 7. Barely Fully Good Fair. 88. Good Fair to Fully Good Fair. 8. Good Fair. 99. Barely Good Fair. 9. Good Fair to Fully Good Fair. 10. Barely Good Fair. 11. Fully Fair. 12. Strict Fully Fair.

Some time later, the other exporting firms followed suit and set up their own standards, each one however employing a different series of numbers as shown in Table II below. Of all these standards, those of Messrs. A. & F. Harvey have become popular and well recognized for two reasons. Firstly, a separate standard has been set up for each variety of cotton; one for Tinni, another for Karunganni and a third for Cambodia. Secondly, each standard is described by a number containing three digits in which the first digit denotes the variety, the second digit the grade and the third digit the staple. According to this scheme of grade classification, the three standards of the Harveys are:—

666 .. .. Tinni.
777 .. .. Cambodia.
888 .. .. Karunganni.

As the above-mentioned numbers in each of the three standards represent the highest grades, a lower number is employed to denote a lower grade. For example, if a particular lot of Cambodia is two grades off in colour and one grade off in staple, its grade number is 756. Similarly, if a sample of Karunganni is three grades off in colour and two in staple, its grade number is 856. This explanation holds good to all possible grade combinations that can be thought of.

The grade standards of the other exporting firms as well as those of some of the mills of the area are given below in a summary form as they do not exhibit any striking peculiarities. In fact, in the case of certain grades, merely arbitrary names and numbers are given. For example, a higher number is employed to denote a lower grade in the case of the standards set up by the Bombay Company and the Japan Cotton Trading Company, and names such as Karan and Felix in the standards of Volkart Bros., are merely conventional.

TABLE II

*Raw cotton standards of certain exporting firms and mills in the Madura Area**

Name of firm or mill.	Tinni.	Karunganni.	Cambodia.	Remarks.
The Bombay Company.	423-(1) 424-(2)	412-(1) 413-(2)	306-(1) 307-(2) 308-(3)	There are only two grades in Tinni and Karunganni.
Volkarts ..	70-(1) F.G.F. (2) †Tamil (3)	71-(1) Felix- (2) Karan- (3)†		There were only two standards and two grades in each standard until 1938.
Japan Cotton Trading Company.	162	364-(1) F.G.F. (2)	160-(1) 161-(2)	Are not in use since 1941.
MinakshiMills.	333	444	555	The standards are similar to those of the Harveys.

In the light of the above-mentioned experiences of the cotton traders of Madura area, we may say that definite grade standards can be employed for the three important varieties of Tinnies,

---

* Numbers within brackets indicate the order of qualities.

† Introduced since 1938.

Karungannies and Cambodia, both in the Madura and Coimbatore Areas, provided that only one uniform standard is recognized in all the markets, that carefully-prepared type samples of different grades are maintained by the Market Committee and that all transactions in the market are enforced only on the basis of these recognized grades as is done at Adoni.

Standards for Cotton Grading at Adoni

The basis for cotton trading at Adoni (Bellary District, Madras Presidency) is the Middling Grade represented by the two symbols, MM and FF, which denote respectively Mungari and Farm cottons. Prices in the market are to be quoted only in terms of this basis grade as so many points "on" or "off" MM or FF—each point "on" or "off" being valued at annas eight. Since the introduction of this method of price-fixing, the Adoni Cotton Market Committee has prohibited buyers from claiming or taking uniform and fixed allowances in addition to the usual allowances which they took when *kapas* in the borahs did not come up to the standard of the samples shown. Moreover, commission agents in the market as well as the buyers who buy directly from the ryots have to maintain their records of purchases and sales entirely on the basis of MM and FF. The market report published by the Market Committee also gives the quotations of local prices on the same basis. The only improvement that is needed at Adoni is the preparation and maintenance of type-samples for the basis grade as well as the other grades.

Standards for Cotton Trading at Tiruppur

The predominant method of sales of lint and *kapas* at Tiruppur being on the basis of actual samples and open bargaining between buyers and sellers, there is very little transaction on the basis of grades excepting for a small volume of cotton sold mainly to the Harveys on the basis of forward contracts. Hence, in order to popularise the method of trading on the basis of grades, the Cotton Market Committee at Tiruppur classified cotton into five definite grades—"superfine," "fine," "fully good," "good," and "fair," prepared and made available to the traders in 1940 samples for three grades, viz., "fine," "fully good," and "good" in respect of Cambodia, and one sample of the middling grade "fully good" in the case of Karunganni. These standard samples, according to the report of the Market Committee, have been discontinued since 1941 as there was no demand for them from the traders.

The lack of demand for trading on the basis of standard samples and the discontinuance of Agmark Grading for Co.2 cotton in the Coimbatore District raises the important question whether cotton grading is essential, when buyers and sellers can meet each other (owing to the close proximity of the markets to centres of production on the one hand and to mills and offices of exporting firms on the other) personally and settle transactions by direct bargaining. Even in the United States of America, personal inspection is said to be taking the place of buying on the basis of grade standards, owing to the increasing use of the motor truck and the facility for buyers and sellers meeting each other.

Even so, the experiences of cotton trading in the Madura Area and at Adoni show clearly that trading on the basis of grade standards gives precision and accuracy to quotations of prices and enables the market authorities to control all transactions. In fact, our enquiries in the various market centres show that financing banks are considerably handicapped in providing credit facilities to their constituents for lack of such accurate and reliable information as to the exact grades of cottons pledged with them, and that they would welcome the establishment and enforcement of grade standards in local markets. It may be added further that the Regulated Cotton Markets of the Madras Presidency may maintain for themselves either from funds provided by themselves or from grants obtained from the Provincial Government a cotton technological laboratory situated preferably at Coimbatore as a part of the proposed Technological College there. Such an institution can carry on some of the routine tests on fibre length, etc., of local cottons which are now being carried on at the Technological Laboratory of the Indian Central Cotton Committee at Bombay and eventually help in the building up of suitable grade standards for cotton trading in these areas.

Markets for Indian Cotton Textiles in Australia and New Zealand

Report on Indo-Australian Trade in 1942-43

Certain statements appearing in the Australian Press regarding the alleged poor quality of cotton textiles imported from India have, on enquiry, proved exaggerated. Enquiries reveal that these statements do not represent the views of the Australian Government, who consider as very satisfactory the quality of textiles coming forward from India. It is understood that the Indian textiles export quota system, linked with the Australian import licensing system, is running very smoothly. In a press statement released by Senator the Honourable R. V. Keane, Minister for Trade and Customs, on 26th May, the following observations appear :—

"As regards complaints made concerning low grade Indian textiles Senator Keane stated that these importations arrived in Australia on behalf of private traders. They had been ordered, imported and paid for by traders who were obviously not familiar with the Indian market. In some cases he believed the purchases were made in the bazars and not from the Indian manufacturers. As far as his information went the quantity so imported was not very large having regard to our total requirements. As soon as the first of these importations arrived the Division of Import Procurement took action to impose an import control under which each importer had to obtain the consent of the Division to the importation and before giving such consent the Division must be satisfied as to both quality and price of the civilian textiles. These remedial measures have ensured that reasonably good and reasonably priced textiles come forward to Australia and enable us to utilise the Indian quota allocated to Australia to the best advantage."

THE following are extracts from the report of the Indian Trade Commissioner, Australia, for the year 1942-43:

Imports of cotton textiles from India into Australia are classified under four broad heads:—(1) Canvas and duck; (2) Grey unbleached ; (3) White bleached and (4) Printed, dyed or coloured. Imports from India under each of these heads recorded an improvement in 1942-43. The share of India in the imports of canvas and duck increased in value from 35.2 per cent. to 35.8 per cent. whereas imports from the United Kingdom, the principal supplier, declined from 57.7 per cent. to 52.5 per cent. as compared with the preceding year. The volume of imports from India under this head, however, declined from 48.9 per cent. to 46.7 per cent. whereas that from the United Kingdom improved from 45 per cent. to 45.8 per cent. showing a proportionately larger appreciation in the price of canvas and duck in the Indian market. This is borne out by a comparison of the average value per square yard which in the case of imports from the United Kingdom improved from 2*s.* 1*d.* to 2*s.* 3*d.* as against a much larger increase of 4*d.* from 1*s.* 2*d.* to 1*s.* 6*d.* in the case of Indian goods. Under grey unbleached the share of India in the total value increased from 41 per cent. to 78 per cent. and quantitatively from 56.8 per cent. to 80.4 per cent. This contrasts with a decline in imports from the United Kingdom of 10 per cent. from 23 per cent. to 13 per cent. in value and of 5.2 per cent. from 19.2 to 14 per cent. in quantity. Here again the average value of imports from the United Kingdom fell from 11½*d.* to 9*d.* per square yard whereas that of the Indian material rose from 7*d.* to 9.4*d.* per square yard. In the case of white bleached goods a similar improvement is recorded. In value the share of India increased from 30.3 per cent. to 58 per cent. and in quantity from 35 per cent. to 56.5 per cent. This was achieved principally at the expense of imports from the United Kingdom which receded in value from 63 per cent. to 37.4 per cent., and in quantity from 62.3 per cent. to 38 per cent. The average value per square yard increased for both countries—imports from the United Kingdom advancing from 10*d.* to 1*s.* and those from India from 8.6*d.* to 11*d.*

In the case of textiles classified under the head "Printed, dyed or coloured," total imports have shown a considerable decline but imports from India have been maintained at last year's level and her proportionate share of the trade thus shows a very substantial improvement—imports have gone up in value from 16 per cent. to 35.8 per cent. and in quantity from 17.9 per cent. to 38.2 per cent. The share of the United Kingdom has fallen from 81.7 per cent. to 61.8 per cent. in value and from 79.2 per cent. to 59 per cent. in quantity. Average values of imports from both countries show appreciation having gone up in the United Kingdom from 11.7*d.* to 1*s.* 2*d.* and in India from 10*d.* to 1*s.* 1*d.*

Imports from India into New Zealand in 1942 were nearly three times as compared with imports in 1941 and are likely to show further improvement in 1943.

In spite of the very substantial improvement which has been recorded in the imports of cotton textiles from India the position should not be allowed to produce a feeling of complacency. Australia and New Zealand have been forced through purely extraneous circumstances to rely on India for the supply of their essential needs of cotton textiles. When these circumstances no longer prevail Indian manufacturers will have to meet very severe competition in these markets and their hopes of survival will depend entirely on their ability to satisfy the requirements of these markets more effectively than their competitors. As regards the special requirements of Australia and New Zealand in regard to piecegoods, emphasis in this market apart from considerations of size is definitely on quality and finish. The presence of inferior goods known as "shoddy materials" is resented and creates a prejudice against the country of manufacture. Unfortunately a substantial proportion of imports from India has not been above criticism of this description. Grey sheeting has been generally of good quality but the appearance and finish has been very poor. In the case of white sheeting with some exceptions, even the quality has not been up to Manchester standard. Heavy sheetings, specially those woven from Egyptian cotton, even though they are expensive have been much in demand. Shirtings have been generally satisfactory but the width of Indian shirtings is unsuitable for the market. It is necessary to keep fully abreast of new designs in shirtings. Some of the drills have not been found suitable for machine stitching. Better finish and improved designs would be an important factor in the sale of towelling, table linen and flannelettes. In the case of prints the question of designs deserves special study. Greater attention must also be paid to packing. Some of the recent arrivals were found to be damaged due entirely to defective or inadequate packing.

It is almost certain that, unless manufacturers take steps, now, to make the necessary adjustments a great proportion of the imports of cotton textiles into Australia and New Zealand will be eliminated as soon as conditions return to normal. Steps are already being taken elsewhere to ensure sales overseas. The following extract from an article in one of the journals here would be found interesting in this connection :—

"Volume in linen and cotton production cannot now be produced in England, but quality can, and is being made. Manchester has recently shown a small, but deeply interesting, collection demonstrating how the manufacturers, working through the Colour, Design and Style Centre of the Cotton Board, have kept up the creative spirit, so that, as soon as the war is won, they can take up both volume and quality sales. Recently Finnigans, Manchester, staged a novel exhibition of very advanced textile designs. These have been created with the express purpose of satisfying an 'after-the-war' market, both at home and overseas—with a particular eye to the Americas. All are gay, colourful and practical, and for inspiration the designers have turned to subjects varying from an English garden in spring to the grim humour of the British nation at war. Propaganda has not been overlooked, and some quaint creations have sprung from it."

Research has also been directed in recent months to the production of new fabrics. Information in regard to two fabrics which are being developed by scientists in the U.S.A. was published here recently. It was claimed for one of these fabrics that "it will look and wear as well as silk or wool, and yet retain the durability and cheapness of manufacture for which cotton is noted." The new fabric is as different from cotton cloth as rayon, but unlike the latter the new cloth does not break down the cotton fibre by chemical means for the cellulose it contains, but uses the natural fibre intact. The new cotton fibre is believed to be based on some new form of synthetic resin application. The four characteristics of the new fabric are stated to be :—1. Resistance to creasing like wool. 2. Ability to fit or shape in the manner necessary for women's garments. 3. Ability to transpire bodily moisture. 4. Durability, meaning that the material can be laundered or dry-cleaned repeatedly.

The second fabric is known as Masslin and is ready for commercial use, but distribution through retail outlets has been postponed until after the war. The process by which this fabric is produced consists of converting cotton into cloth without spinning or weaving. It is expected to be used for cheap tablecloths, sheeting, etc.

Suggestions for Promotion of Goodwill

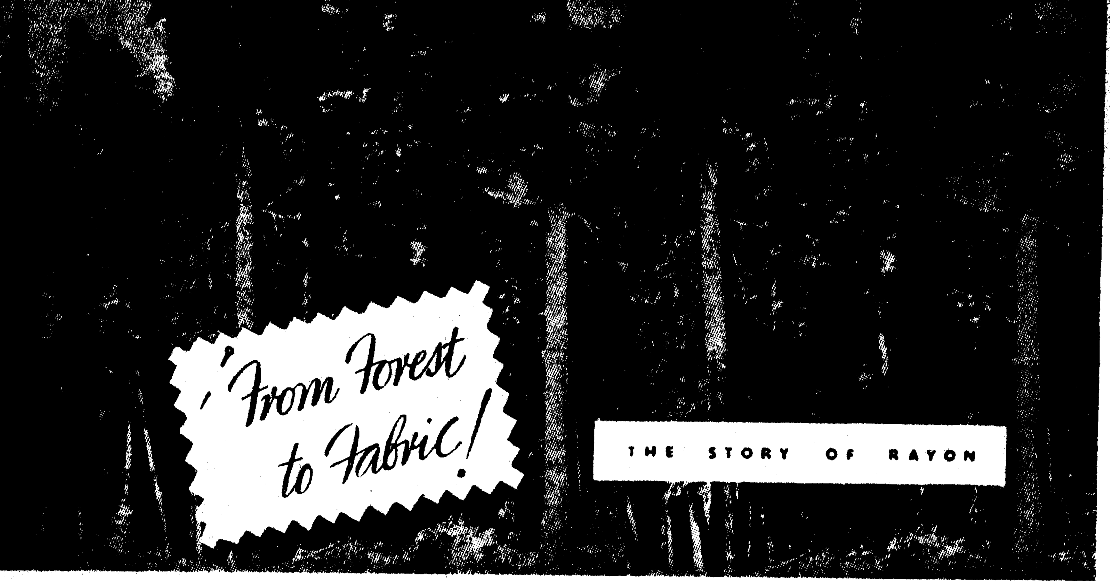
It is highly important to develop trade with Australia and New Zealand.

1. *India favourably placed in Australasian Markets.*—At present, owing to purely adventitious circumstances, the Indian exporter is very favourably placed in the Australasian markets. He has virtually no competition from rival sources of supply to overcome. On the other hand, the consumers have a large surplus of purchasing power in their hands due to greater employment and larger earnings. In these circumstances, the importer buys what he can get and wherever he can get it. The seller in India is in the fortunate position not only of being able to sell what he has, but also to dictate his own terms. As conditions begin to return to normal this very desirable state of affairs will no longer prevail. Manufacturers and suppliers from other countries will endeavour—and there are unmistakable indications that they are already looking ahead and preparing so to do—to enter or re-enter these markets, and as these offers increase in scope and variety the Australian importer and eventually the consumer will again begin to indulge in the luxury of discrimination in buying which he has had to forgo. This discrimination will be exercised in favour of the Indian exporter and manufacturer only if he has earned the goodwill of the importers on this side, and his goods from the point of view of variety, quality and price, do not compare unfavourably with those from other sources.

2. *Study of Special Requirements.*—In order to achieve this result it is essential, in the first place, that the special requirements of this market should be studied and necessary adjustments made wherever possible. In the case of cotton textiles, for example, the quality, colours, patterns, widths and finishing are of great importance. This is equally true of floor coverings. Somewhat similar considerations apply in the case of other commodities. The Trade Commissioner will readily assist manufacturers and exporters in studying the requirements of this market in specified lines.

3. *Packing.*—Another equally important factor is packing. Insufficient attention has been paid in India to this factor, and otherwise acceptable goods have been damaged in transit to Australia due to their being packed unsuitably or inadequately.

4. *Adoption of Improved Business Methods.*—I would again like to emphasize that Indian business methods leave considerable room for improvement. Samples sent are very often far from adequate. Prices are not quoted or, if quoted, the buyer is asked to make counter offers. Very naturally it is presumed, in these cases, that the seller is endeavouring to bargain with the buyer, and is not quoting a fair and reasonable price. Again, in the matter of business correspondence, many firms in India do not pay sufficient attention to details and are not prompt in sending replies. This creates an unfavourable impression.



'From Forest to Fabric!

THE STORY OF RAYON

AN early English scientist, Dr. Robert Hooke, forecast the foundation of the rayon industry in this quaintly phrased passage, written in the middle of the seventeenth century. " I have often thought that probably there might be a way to make an artificial glutinous composition, much resembling, if not fully as good, nay better than the Excrement, or whatever substance it be out of which the Silk-worm wire-draws his clew."

Fulfilment of a Prophecy

Two hundred years later Sir Joseph Swan, while experimenting with materials for making electric-lamp filaments, triumphantly produced a glossy, silken thread by squirting a solution of nitro-cellulose. Sir Joseph patented his discovery in 1883, but did not commercialize it. In the following year, however, Count Hilaire de Chardonnet became the first commercial developer of rayon and established works in France, Switzerland, Belgium and England.

The next advance was made in 1892 by two Englishmen, C. F. Cross and E. J. Bevan. They discovered a method of spinning, from a solution of cellulose, a smooth thread which they called "viscose." They enlisted the services of Stern, one of Sir Joseph Swan's associates.

Finally Topham, working with Stern, invented the system of rayon-spinning still most widely in use.

PART PLAYED BY COURTAULDS

It is at this point that Courtaulds link up with the story of rayon, and the development of the present colossal industry begins. The Courtaulds are of Huguenot origin. George, great-grandson of an early Courtauld who settled in England, built a silk factory in Essex in 1798. But it was Samuel, son of George, who laid the foundations of the present business. Samuel Courtauld became interested in the manufacture of mourning crepe and built up a wide reputation.

The firm prospered and in 1891 it was converted into the private company of Samuel Courtauld & Co. But it was realized that Courtaulds would have to develop on other lines, and for this two eminent textile men—Henry Greenwood Tetley and Thomas Paul Latham—were brought in. It was Tetley's steady belief in " artificial silk," backed by Latham's exceptional business ability and the support of the other directors, that have marked them as two of the most remarkable men ever known in the textile industry. In 1904 the Company bought the British rights of the Cross and Bevan viscose patents and established, at Coventry, its first rayon factory in Britain, the late Mr. Harry Johnson, a Macclesfield man being manager.

Reward for Enterprise

Success came quickly. New and better methods of manufacture have constantly been adopted and obsolete machinery immediately scrapped. Extensions of manufacturing plant and the exploration of new uses have gone side by side. After weaving, use was found for the yarn in hosiery (but only after nearly every hosiery manufacturer had been offered free samples and had refused to be bothered with the stuff), in laces and in knitted goods. A typical example of Courtaulds' enterprise was the purchase in 1917 of a factory in Halifax for the manufacture of furnishing fabrics. Up to this time no manufacturer of upholstery fabrics would touch rayon. At Halifax new furnishing fabrics were produced consisting of rayon mixed with cotton, with wool and with silk ; the new fabrics were so attractive that other manufacturers were compelled to copy them and make use of rayon.

In order to demonstrate to the cotton and worsted trades what could be done with staple fibre, or " Fibro," which is Courtaulds' registered brand name for their staple fibre product, they purchased a large cotton mill at Rochdale, and later, a worsted mill at Bradford.

How Viscose Rayon is Made

Let us follow the rayon clue to the beginning. First we go over the sea to high-pointing Canadian spruce forests, for it is the lofty spruce that eventually becomes those fine fabrics that are such a joy to wear and use. Yes, it is from wood—difficult though it is to believe—that the thread of rayon is created.

The trees are felled. Then the journey starts. First the logs go floating downstream to the pulp mills. There they go through about ten processes before they are reduced to almost pure cellulose. They are stripped of their bark, cut into small pieces, boiled in chemicals to remove all trace of resinous impurities, washed, bleached and scoured. Lastly the cellulose is dried by being run over steam-heated cylinders. It now resembles sheets of thick blotting paper and is guillotined and baled up for its long journey to Courtaulds in England.

In the English factories the cellulose receives almost as much care as a new-born baby. Weight, time and temperature are all carefully checked. Even the degree of moisture in the atmosphere is controlled during the next very important operations. Samples are constantly tested and nothing is left to chance.

Caustic Soda Plays its Part

First the sheets of cellulose are cut to standard size, gauged and weighed in batches. Then it is time for the cellulose to take a bath. But it is not water in this bath, instead a solution of caustic soda. Thousands of tons of caustic soda are produced annually in Great Britain for the rayon industry alone, for it is caustic soda in solution which plays such an important part in the transformation of cellulose. The caustic soda dissolves away everything that isn't required, while the remaining cellulose combines with it to form what is known as alkali cellulose. Drastic treatment follows bath-time. Hydraulic presses remove surplus moisture. Pulverizing machines (very similar to dough mixers) tear the sheets of pulp between large spiral blades and heavy serrated bars until they have the appearance of crumbs. Throughout this process the temperature is controlled.

Following this the crumbs are emptied into large tins and stored for a period under identical atmospheric conditions, in order that the chemical action of the caustic soda may be completed.

Soluble in Water

The cellulose alkali crumbs are next transferred to the churn room. They are placed in large hexagonal churns to which is added a measured quantity of carbon bi-sulphide. When the churn is turned, the crumbs are changed from a creamy-white insoluble material to an orange-red

Left to right:—Count Hilaire de Chardonnet, Mr. Edward John Bevan, Mr. C. F. Cross, Mr. Henry Greenwood Tetley and Mr. Thomas Paul Latham.

sticky mass soluble in water. This new substance is called cellulose xanthate.

It is on the result of the discovery (made by Cross and Bevan in 1892) of cellulose xanthate's solubility in water that approximately 88 per cent. of the world's production of rayon depends.

The Formation of Viscose

The cellulose xanthate is emptied from the churns into large mixers, where it is dissolved in water. A series of paddles keep the water in continuous circulation until the charge of xanthate is thoroughly dissolved. Now it is *Viscose*—in appearance and consistency very like run honey. It must now mature for several days and for this purpose is taken into cellars—called caves—and stored again under controlled conditions, in large containers.

During this period it is meticulously filtered to remove all undissolved cellulose or other solids. The filtration is carried out by passing the viscose through several layers of specially woven cloth as well as thick sheets of wadding placed between perforated sheets. The process is repeated three or four times. In addition, vacuum pipes extract any air or gas which may have got into the solution, for if the solution contained any suspended matter whatsoever, the step which follows would be spoiled.

The Thread of the Story

The reason for this very exact filtration is seen next when the viscose is forced through a spinneret into a bath of acid to coagulate into a fibre about as fine as that made by a silk-worm. This is the most amazing step in the whole wonderful process of the creation of rayon. Wood has been reduced to a liquid, and now the liquid is changed into a thread which can be woven into cloth that compares with—and frequently has advantage over—that woven from natural silk, cotton or wool.

It is very much easier to appreciate this all-important feature of rayon production by repeating it in a simple experiment. A fine stream of viscose is poured into a beaker containing dilute sulphuric acid. As the liquid viscose enters the acid it coagulates, then solidifies, and in a second or two forms a continuous thread. This is a thread of rayon !

Care Makes Perfect

In the commercial manufacture of rayon the viscose is forced through tiny holes in a spinneret. This is roughly the size of a small thimble and there are as many as 500 of these tiny holes in its head. (Thus you can understand the importance of the very exact filtration already described. The slightest speck of matter in suspension, or bubble, would cause stoppage of the microscopic holes.) The number of holes in the little spinneret (or jet) —usually made of a platinum-gold

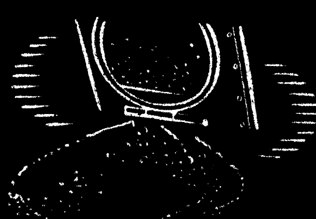
4. The next stage—Cellulose Xanthate



alloy—decides the number of fibres in the rayon yarn. The size of the yarn is technically described as so-many denier.

Spinning and Winding

The fibres that come from the spinneret are drawn over a glass wheel and dropped down by a glass tube into a rapidly revolving box. As the glass funnel rises and falls, the rayon is drawn into the box by centrifugal action and wound to resemble a cake from which the inside has been cut out. In fact it is called a cake of rayon. Also, the diameter and speed of the box in ratio to the delivery rate of the glass wheel determines the amount of twist which is given to the rayon. From the spinning machines the cakes go into conditioning cabinets, before being wound into hanks. (It is easiest to wash, bleach or dye yarn in hank form.) After hanking, the yarns are given preliminary washing to remove surface impurities. They pass slowly through a spray washer and next travel through ovens on the way to bleaching. This consists of another wash, a spraying with sodium sulphide, a dose of bleaching solution, a " souring " process to neutralize the bleaching action, and a final washing in fine soap solution. Clean cloths now protect the hanks as they are dried by hydro-extraction and in long steam-heated ovens. Did you notice the extreme care taken in bleaching and washing? It is to preserve the natural whiteness of rayon so that it can be dyed in more delicate shades or intense colours than can be obtained with any other yarn.

As Rayon Leaves the Mill

After passing through an elaborate series of tests and inspection, the loose hanks are placed in small presses for packing and labelling, graded according to their denier and quality.

Courtaulds supply rayon for every form of textile manufacture and they prepare the rayon according to their customers' methods of working. For weaving they wind and size the rayon on warp beams or wind it on weft tubes. For hosiery manufacture or circular knitting the yarn is wound on large cones. For warp knitting it is supplied on little bobbins or ready prepared on beams.

Spun Rayon: The Manufacture of "Fibro"

Rayon is a yarn made of *continuous* filaments twisted together. But spun rayon follows cotton and wool. It is formed by the twisting together of *short* fibres, all of equal length. To make spun rayon, the rayon filaments are deliberately chopped into lengths and then spun into a continuous thread once more.

You will probably say, " Why go to all the trouble of producing continuous threads of rayon filament only to chop them up and re-spin them? " Your

question is justified. The reply is that there are many very good reasons for producing spun rayon. Spun rayon is a yarn of great adaptability. It is made into fabrics resembling cotton, fabrics resembling linen, fabrics resembling wool. It is, too, a most successful partner when married with any of these yarns. Fabrics of most unusual surface interest and beautiful colour effects can be created in this way. These depend on the blending of yarns, either before or during spinning, or spun yarns of different staple length being spun together.

Spun rayon makes excellent fabrics that do not wrinkle or crush easily. They are more comfortable than wool in warm climates—although similar in appearance —while the " Fibro " content lessens the shrinkage possibilities of many fabrics.

Since in the manufacture of " Fibro " spun rayon, the fibres can be made finer or coarser at will, the finished fabric is more even in all characteristics than one woven from a natural—and therefore uncontrolled textile fibre.

The method of manufacturing " Fibro " is the same as that of continuous filament rayon until it leaves the spinneret. Then filaments from all spinnerets on a frame are drawn together—not twisted—into rope of thumb-thickness. It is bleached and washed. Then the rope of filaments is drawn into a cutter and chopped into equal lengths. The length of the staple varies according to the type of machinery to be used for spinning. Cotton spinning looms require lengths of one to two inches, worsted machinery requires lengths of two to seven inches.

In spinning " Fibro " has several advantages. It comes to the mill absolutely clean. It does not have to be scoured or bleached. Moreover, it does not have to be sorted, all the fibres being of standard length. The usual fine dust of cotton waste which hangs like a pall over the frames in a cotton mill is entirely absent when " Fibro " is being spun.

Courtaulds' registered " Tested-Quality" trade mark was created to make it possible for the public to buy fabrics and garments made with Courtaulds' rayon and spun rayon yarns, whose qualities had been thoroughly tested before being passed for retail sale. The mark was introduced because Courtaulds, with overseas associates, realized that since rayon is now universal, a definite quality level should be set for goods made from Courtaulds' rayon.

Courtaulds want to ensure that the loveliness of their rayon fabrics and garments will last, so that wear and washing will not bring disappointment through shrinkage, fugitive colours, bad seaming or other deficiencies. Under Courtaulds' Quality-Control Plan, manufacturers using Courtaulds' rayon yarn submit complete ranges of samples. These are then tested against Courtaulds' specifications—based on their experience of textile production and public requirements —by the Testing House of an *independent organization*, the Retail Trading-Standards Association.

If the Testing House reports that the samples come up to specifications, the manufacturer then signs an agreement to use the " Tested-Quality " mark on goods identical with samples tested, and these can be identified by the special tickets and tabs bearing the mark. Tests cover points of fabric construction, tensile strength, washability and dry-cleanability, colour fastness, resistance to fraying, suitability for ironing, etc. Each sample passes at least seven and sometimes as many as twenty-two tests.

In the middle years of the nineteenth century, employers as a class were not over-zealous in consideration for their workers. It is pleasing to find, therefore, that Courtaulds were one of the pioneers in making provision for the care and well-being of their employees. As early as 1852 the firm had fitted out a hostel for young girls, an institute—with a library included —and an evening school. More, and this is particularly interesting in view of modern war-time welfare schemes, the firm established a nursery, where mothers would leave their children under care while at work in the factory, and where the children were provided with a midday meal. But that is not all. Courtaulds, perhaps for the first time in industry, employed someone to visit the workpeople in their homes and to provide comforts in cases of sickness—the mid-Victorian proto-type of the modern welfare officer. During the winter months, arrangements were made for workers to be supplied with hot soup at a penny a pint—forerunner of the canteen service of to-day.

The Testing of Proofed Fabrics and the Need for Rigid Standardization

By C. S. JONES, M.A., B.SC., F.R.S.A. (London)

(*Specially Contributed*)

WITH the advances made in the proofing of textile fabrics, either for water-repellency, moisture-immunity, against fire and flame and rot and mildew, the most outstanding of which is the former, some method of standardization of tests has long been felt in the trade. This has been accentuated by the variability of the specifications issued by the Government during the war, many of which insisted upon a combination of occasionally two or three or more of each of the "proofing" processes to meet unusual demands for specialized equipment. In addition, not only have the sellers of proofing compounds but manufacturers employing these compounds been driven to the wish that some rigid lines should be set up once and for all, and that a recognized testing standard agreed upon as fair to all parties, reproducible and sufficiently quick as easily applied should be the basis of such a standard.

It is appreciated in manufacturing quarters that there may be a desire or a tendency on the part of some processors to confound the issue deliberately by advocating test methods which happen to give flattering figures for their own productions and low figures for those of their competitors, without regard to actual merit, but it is characteristic of the first-class firms engaged in the proofing section of textile manufacture that they only want recognized standards which really prove the merit of their goods. It is thought in the proofing trade generally that tests for efficient water-repellency will be based on those which have been in vogue for several years, with added improvements or amendments as experience may seem to warrant. It has, however, been abundantly clear that none of the usual test methods now in use are properly efficient or sufficient; in fact, they are usually misleading to a high degree. The three standard methods at present adopted may be divided into the Drop Test, the Hydraulic Pressure Test and the Cone Test, of which there are many modifications in detail but none in principle.

Drop Test

In this test drops of water under specified conditions are allowed to fall upon cloth and the time noted when either the first drop comes through into the free space or shows on a piece of filter paper immediately behind it, or saturates a piece of filter paper fastened behind it.

Hydraulic Pressure Test

The cloth is stretched over a drum, and steadily increasing water pressure is applied to it, until the first drop is observed to come through the fabric.

Cone Test

In this test, the cloth is folded into a cone, a certain quantity of water poured into it, and the amount which comes through in a given time estimated.

Limitations of Tests

It is obvious that all these tests are for water-tightness, and any of them would show 100 per cent. efficiency for a thin sheet of glue. Clearly, they are tests for the existence of non-penetrable film, and as such would be reasonably applicable to oilskins, tarpaulins or tent cloths, but they clearly have no validity whatever in dealing with woven fabrics such as showerproofed or rainproofed cloths, uniforms or other wearing apparel which is the modern developing of proofing adopted by those firms who do not employ rubber or compounds of rubber in their processes. The methods referred to test rather the weave and not the proofing which the fabric has undergone. Scientifically, they are unsound since they suffer from the serious disadvantage that the test samples do not represent the bulk. A single pinhole which might have arisen after the manufacture of the fabric will cause a piece that is otherwise practically perfect to be rejected. In the nature of the case it is not possible to weave a faultless piece of cloth; and it must be clear that the test, to be of any value, must give an average or representative value of the merchandise and not merely a figure which represents solely a property of the particular sample taken.

This is quite clear in the Drop Test since the condition of the point of impact of the water will determine the end result. This end result is again influenced by the size of the interstices or spaces of the weave in relation to the height from which the drop falls, for it is possible, of course, for a drop to bounce through a hole instead of running directly through it. The results are influenced by the precise method of holding the cloth. The least difference in tension of weft or warp created whilst attaching the cloth to the testing machine will produce results differing by many hundreds per cent. Again, the test is vastly influenced by the mechanical conditions of the surface. A cloth which has been rejected on the Drop Test after being smartly brushed with a stiff brush has been known to pass the test easily, whether it is proofed or not. This knowledge, which is widespread, gives rise to practices which are, to say the least, decidedly dubious. Further, a cloth which is quite perfect on the Drop Test, if well ironed, will probably fail. Again, if the filter paper used, as is done in the majority of cases, is hairy, the test result will be good; if it is ironed before use the test will be bad; and these results will vary with the precise pressure that exists between the cloth and the filter paper upon which it lies or is pressed.

It is again clear that as the Drop Test only tests about 0.5 sq. cm., in order to judge the merit of a full piece of cloth not less than 5,000 tests should be made upon that piece if full justice is to be done. This may sound excessive, but it is the answer of a formal probability calculation of results of extensive experiments which have been carried out strictly. In practice the Drop Test is found to vary between operator and operator of as much as 300 per cent. to 400 per cent. and so much is this appreciated in the proofing trade that when a cloth is rejected as unsuitable on the basis of the Drop Test it is frequently merely held back in stock for a few days and returned, and it has been known that these previously rejected goods have been passed as perfect in water-repellency.

In similar ways, the Cone Test and the Hydraulic Pressure Test are completely unreliable for the very same reason that they do not represent the piece tested. It will be appreciated that the larger the piece taken for the test, i.e., with the increased probability of including one of the unavoidable weaving faults, the greater the probability of the results being unreliable.

Finally, the writer affirms that none of the above-mentioned tests may be tests for water-proofness or water-repellency at all. The best figures may be given by "proofing" substances, which, so far from being waterproof, are hygroscopic; whereby, they themselves swell and fill the interstices of the cloth or cause the cloth to swell. The more perfectly a lightly woven fabric is proofed, the worse the results will be in these cases. This is also well known and it is not uncommon with some proofers to add dextrin, glue or similar bodies to the finish, partly, it is true, to give a desired handle, but equally to enable it to pass the standard proofing tests.

The above is a situation that should not be tolerated either by scientifically minded people or by those in the proofing trade who honestly stake the reputation of their brand of proofing. The position has become more acute, particularly with the advent of Government contracts in which proofing processes enter on so large a scale and with the insistence, as at present, on a three-hours test as a criterion of merit. Hence, it is felt in the trade that the time is ripe for a complete and comprehensive review of all tests now employed in this section of the processing trade. A further reason is the inappropriateness of the above test, demanding as it does such protracted time, labour and unnecessary supervision so that the work imposed on the testing staffs not only leads to undesirable consequences but brings about unnecessary delay—a further reason for disquietude in these strenuous days.

Bundesmann Test

In the writer's opinion, based on many years' scientific research and much practical experience in the processing industries, the only test which will give a practical figure is the Bundesmann Test and he is of the firm opinion that if and when a test on these lines is universally adopted the waterproofing technique throughout the whole of the textile industry will begin to make some progress. Of German origin, the Bundesmann testing apparatus has been employed in the testing houses of several leading firms in Britain for the past five or six years. It is impossible to secure the necessary apparatus at the moment, but it is understood that it will very shortly be manufactured in Britain on possibly modified, but nevertheless essentially accurate, lines, and will then be available to all proofers and others who are engaged in the textile trades.

Briefly, the processes adopted in the Bundesmann Test are as follows:—The fundamental of the Bundesmann standard is that of subjecting the fabrics to rain of approximately tropical intensity, whilst at the same time the fabrics themselves are subjected to a frictional movement comparable to that imposed on materials by the wearer of clothing during severe physical action. The apparatus comprised an overhead tank having some 300 jets each of 0.4 mm. diameter, from which water drops a depth of 5 ft. on to a series of rotating cups, each of 100 mm. in diameter, which are covered by samples of the fabrics held firmly in position by spring clamps. The series of four cups are fixed to four arms which rotate on a central shaft, and each cup is fitted with a mechanism which, during the test, produces a constant friction on the underside of the fabric test-pieces by the action of a series of ribs rotating in an alternating direction to the cups themselves. All water which does not penetrate the fabrics flows across the cups into the runaway tank in which the rotating apparatus is fixed. The general method of testing may be described as follows:—

1. Fabric test-pieces which have previously been weighed are placed over the testing cups and held tightly in position by spring clamps, the cup-rotating apparatus being then fixed into the reception tank. 2. The motor is switched on and the water allowed to stream over. 3. The water stream flows on to the rotating cups below for ten minutes in two separate periods of five minutes each. 4. At the end of the first period of five minutes the motor is switched off and the quantity of water, if any, is measured that has penetrated the fabric test-pieces into the cups. This figure represents the "water penetration" normally after the equivalent of 1¼ hours' heavy rain. 5. At the end of the second period run of five minutes, the quantity of water is again measured that has penetrated the test-pieces. This is found to be also the equivalent of 1¼ hours' heavy rain. 6. The total water penetration is then noted. 7. The test-pieces of fabric are then weighed to make comparison with their original weight before commencing the test. The increase in weight represents the absorption property of the fabric and is treated as a percentage increase over the original weight of the test pieces.

The most readily appreciated comparison is that made by direct simultaneous test with an identical piece of fabric which has not been proofed. A still more important comparison is to be obtained by simultaneously testing the identical fabric which has been proofed for water-repellency with the unproofed test-piece.

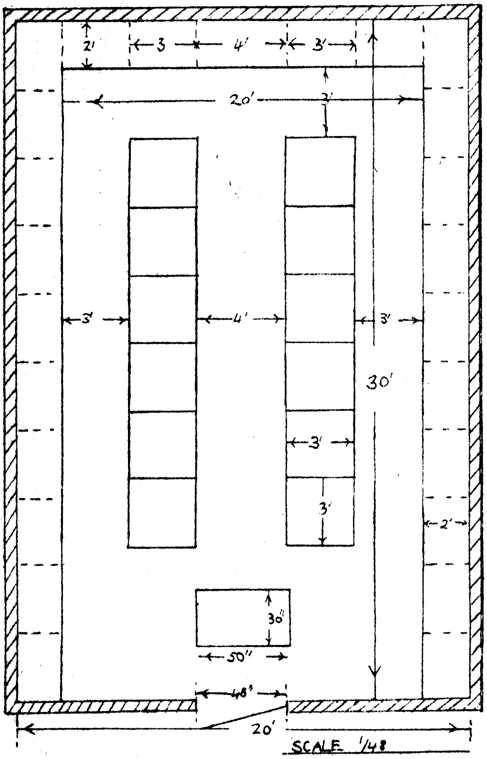
The results of the Bundesmann test vary as between operators plus or minus 5 per cent. The test has the advantage that it does, in fact, average the 40 sq. in. used in the test. An occasional pinhole has something of its proper effects in relation to the piece which is being tested. The addition of hygroscopics to give a good non-penetration test is revealed by the increase in weight. The rubbing action of the rubber in the apparatus eliminates mere surface finish effects and simulates the conditions under which the material is used in actual practice. Unquestionably, the Bundesmann test is the best one to be adopted. It has the overwhelming merit of being able to give a practical figure reproducible at different times and by different persons within 5 per cent. and which does bear a direct relation to the behaviour of the material in actual use, in contradistinction to any of the tests discussed in this article, whether they be the Drop Test, the Hydraulic Pressure Test or the Cone Test.

Internal Lines of Communication

By BERNARD DAWSON

(All Rights Reserved)

A FACTORY in war-time is very much like an army in the field. While the machines are producing they are just like an army advancing and, like an army, they have lines of communication that must be kept intact and free from enemy aggression. For a general to allow his lines of communication to be cut is a very serious disaster, and for an officer of a department to allow his machines to stop through any fault of his own is, to him, just as big a disaster and disgrace. Now we are all familiar with the term "lines of communication" in its military sense, but we need not understand how these lines are maintained. We must know, however, what our own lines of communication are and how they must be kept open. Just as in a military machine there are more than one line to maintain so in a mill there are also numerous lines. In this article we shall deal with one of them and the action that should be taken to keep it free from disruption.



To succeed in our main object of keeping the machines working we must have a continuous stream of supplies in the form of spare parts. It is, therefore, necessary to build up some simple, but at the same time foolproof, method of procuring and maintaining a stock of such parts, and arranging a suitable place in which to store them. We must also keep an efficient record of orders placed with the various suppliers, the details of our future requirements and our present stock.

Let us first of all take the housing of these stores. It is a good practice for the departmental head to have, directly under his control, all the spares necessary for his machines, and to have some small room in his department set aside for the purpose.

A room 20 ft. x 30 ft., a plan of which is shown here, should suit average requirements.

A strong door and skylights are essential. A four-tier rack running along the walls should first be erected. The depth of the shelves should be about 24" and the distance between each partition 36". Old iron pipes about 2" in diameter and 11 ft. long should be set in the floor and braced at the top. If they are set in the grounds for a depth of 2 ft. and well cemented they should be quite firm. These uprights are further supported by horizontal cross pieces made from angle irons, bolted to the uprights and forming the frame upon which the wooden shelves will be fixed.

The shelves should be placed at the following heights from the ground :—

Top shelf	Nine-foot mark.
Third shelf from the floor	Seven-foot mark.
Second shelf from the floor . ..	Five-foot mark.
First shelf from the floor ..	Three-foot mark.

It will be clear that at these heights, holes must be drilled on the uprights to allow for the bolting of the angle irons which will form the racks. At the 3-ft. intervals, where the upright posts and angle irons intersect, another angle iron, 2 ft. 4 ins. in length, will be required for every intersection. These angle irons will run at right angles to the wall and will be cemented into the wall about 4 ins. When this has been done all around the walls, we shall have completed the framework of our racks, which are now ready for filling in with ¾ in. boarding which should be made to fit nicely upon the angle irons. If it is thought necessary to divide the boxes thus formed, wooden boards, ¾ in. x 24 ins. x 24 ins., can be made and fixed up as partitions, but they should not be made into a permanent fixture, as some boxes may be required bigger than the standard size. In the centre portion of the room, similar racks may be built. The positions of the uprights and cross angle irons may easily be seen from the plan of the room, the scale of which is ¼ in. to the foot. In this plan I have shown two rows of broad racks 3 ft. wide, 24 ins. between each shelf, and the usual length of 3 ft., between each upright. The height is also 7-ft. from the ground to conform with the other racks around the walls.

It will be seen that a good space has been left vacant at the end of the room near the door. This is for convenience to facilitate the carrying in and unpacking of cases, and it also makes room for a table and counter for the storekeeper, who will be the only person allowed in the portion of the room behind this barrier.

Having constructed our store room, we must next consider how to maintain it in an efficient and systematic manner. I shall describe a method which gives ideal results, and is at the same time fairly foolproof and capable of being carried out by an intelligent clerk, a method which combines three essential points : (*a*) sectional, (*b*) numerical, (*c*) alphabetical.

For an example we shall consider that our store room is to be used for the spinning department of a cotton mill. There will, therefore, be the following sections taken in the order of process :—

Section 1 .. Blowing room.
,, 2 .. Carding.
,, 3 .. Drawing frames.
,, 4 .. Slubbing frames.
,, 5 .. Intermediate frames.
,, 6 .. Roving frames.
,, 7 .. Ring frames.
,, 8 .. Ring doubling frames.
,, 9 .. Combing machines.
,, 10 .. Waste plant.

There are ten separate sections, each requiring its own share of space. It is fairly safe to give about one-third to the ring frames, one-third to the speeds and one-third to the remainder. Allot the space to the respective sections and in the centre of each space, well above the racks, erect a clearly worded notice of the name of the section in painted tin. Now comes the work of numbering the divisions of this space (which are the boxes already described). These boxes which will hold the different parts used on the machines in this section, should all be numbered from one to whatever number the last box may be. In the first compartment place whatever part begins with the earliest letter of the alphabet, for example, those beginning with C should come before those beginning with F and so on.

Our next point is the clerical side or the keeping of accounts and placing of orders, store checking and stock scrutiny. First draw up the ledger. By glancing at the chart, which is really a specimen page of our ledger, the method of posting will be readily understood.

One page is entirely given over to each separate item. Entries are made for twelve months on each page, from January to December. The entries of items in this ledger should be in consecutive order, first section-wise, then ,the items entered alphabetically, e.g., " arbor roller" coming before " camm heart," etc. This will enable the different items to be found quickly.

Section .... Machine .... Maker .... Year ....

Name of Part	Box No.	Cat. No.	Sup. No.	JANUARY				FEBRUARY			MARCH			APRIL			MAY			JUNE			JULY		
				Last Bal.	Received	Issued	Balance	Received	Issued	Balance	Received	Issued	Balance	Received	Issued	Balance	Received	Issued	Balance	Received	Issued	Balance	Received	Issued	Balance

The balance column is posted at the end of each month from the data noted on the index cards which will be described later. These cards are hanging on hooks in the little shelves given over to the separate items. The number of any particular shelf is found by consulting the ledger column entitled " No. of box."

Let us next take the placing of orders. To keep accurate records of this work a well designed store order book is necessary. A specimen page is given below.

Small cards are printed with the headings and rulings as the sample card shown at the bottom of this page.

One of these cards is hung on a hook attached to the particular box for which it is intended. The number of the box, the name of the section and the name of the parts are written in the space provided. In the columns we must enter the necessary particulars and each time an issue is made, the entry is noted and the subtraction made from the balance column.

Section.	Machine.	Item.	Cat. No.	Box No.	Date Order Placed.	Quantity	Price Quoted Rs. a. p.

Received	Pending	Date	Received	Pending	Date	Received	Pending	Date	Store-keeper

Across the top of the page we have the following headings : Section, machine, item, catalogue No., box No., date of order, order placed with, quantity ordered, price quoted.

Under these headings and all across the page we have the following columns for the accounting of deliveries : Received, pending date. It will be noticed that a complete page has been given to each item, and it is a good plan to have these pages in a loose form so that further sheets may be added later, and so that any orders over many years can be kept together for comparing prices, etc.

A similar order book should be kept for any orders placed with our own engineering department although, of course, engineering department orders could be recorded in the general order book.

The next problem is store checking. The most successful results can be obtained by employing the card index system specially adapted to our own work.

This acts as a day-to-day check on all issues and balances. Fresh receipts are also noted and the necessary adjustments made. It is obvious that, with the aid of this card, the balance in stock of any item can be seen at a glance.

At the end of the current month, the storekeeper consults these cards to make up his store ledger, and to give the monthly figures of stores received, issued and remaining with him.

From these same cards the officer can easily check any item by comparing the figures in the balance column with the actual number in stock at that time, and is thus enabled to keep a watchful eye on the storekeeper and his accounts. At the end of every month, the storekeeper must show the store ledger to the officer, who must in turn scrutinize the balance and issue columns and make notes concerning the ordering of future supplies. For instance, if a particular item shows an

Size-mixings for Cotton Warp

By K. C. SAHA, B.SC., L.T.M. (Hons.)

(*Specially Contributed*)

THE question of size-mixing has long been considered a secret by weaving masters. Some weaving masters are particularly keen on the selection of sizing materials, the judgment of the proportion of ingredients and the preparation of the mixing ready to be used in the size-beck. It will be seen that these are no secrets but a clear conception of the properties of materials to be used and a strict attention as regards their use in different types of work. Here we will discuss the matter under the three heads mentioned above in detail as far as practicable. Before coming to it, however, a brief study of the composition and properties of cotton, those of yarns intended to be sized and the aim of sizing will throw better light on the subject-matter.

Composition and Properties of Cotton

Cotton is grouped in natural cellulose (vegetable fibres) as one having unicellular fibres composed of a single cell. The average composition of cotton can be enumerated as follows:—

Cellulose	85.0%	100.0
Moisture	8.5%	
Fat and wax ..	3.5%	
Ash	1.0%	
Pectin and pectic matters	0.5%	
Protein and colouring matters	1.5%	

Of these, only cellulose and moisture remain in the cotton of a fabric, other matters being removed by bleaching. Cotton fibres appear like flattened ribbons, twisted and having thick cell-wall, cell-cavity and natural convolutions. The outer cell-wall, being poor in water content, is more resistant to the action of foreign agencies. Cellulose is reacted physically and chemically as follows:

Physical.—(i) Heat, (ii) Light and (iii) Frost.

(i) Upto 100° C. cotton loses its natural moisture which, on cooling, it absorbs again from the air. Its property does not show any marked difference upto 150° C. but above this temperature it begins decomposition, the degree of which is dependent on the temperature and the time. Moist heat, however, yields a plastic effect which makes cotton goods to take up any crease or shape by the application of pressure.

(ii) Light containing ultra violet rays in presence of oxygen slowly converts cellulose into oxycellulose.

(iii) Wet cotton if exposed to frosting temperature is damaged in tensile strength owing to the expansion of water that freezes within the cell-wall.

Chemical.—(i) Acids, (ii) alkalis, (iii) oxydizing agents, (iv) salts, and (v) micro-organism.

(i) Cellulose boiled with Conc. H_2SO_4 and HNO_3 yields sulphonated and nitrated cellulose respectively. In cold conc. H_2SO_4, however, cellulose is first swollen up and then dissolved and thus gets itself degraded. Cold conc. HNO_3, acting for a short time, gives it an effect similar to mercerization. Cellulose is degraded into simpler products by the action of dilute acids, the action being similar to hydrolysis.

(ii) Mild alkalies as well as dilute solutions of strong alkalies have no action on cotton except saponification or emulsification of the impurities contained in it. Concentrated solutions of strong alkalies have the mercerizing action.

(iii) Salts in hot or cold solutions have no chemical reaction with cellulose. Only salts which form acids after hydrolysis react with cellulose and weaken it in tensile strength.

(iv) Strong, particularly, vigorous oxydizing agents in heat reacts with cellulose and ultimately converts it into oxycellulose.

(v) Development of mildew tenders the cloth.

Properties of Yarn

A good spun yarn for weaving should possess the following qualities:—

(i) It should have sufficient tensile strength to withstand the strain of weaving. Roughly, the strength may be ascertained from 6s to 25s as $\sqrt{\text{count}}$ divided into 410 less a figure from 25 to 6s in the reverse way (by John H. Strong).

(ii) It should be pliable and elastic to the greatest extent possible to afford flexibility and minimize breakage in the process of weaving.

(iii) It should have the property known as porosity and capillarity by virtue of which the yarn can easily absorb liquids and solutions to allow them to permeate through its substance.

(iv) It should keep the natural lustre of fibres.

(v) It should withstand the conditions of wear and tear.

Aims of Sizing

The aim of sizing is to add strength to the yarn and lay down the projecting fibres on so as to keep the properties of yarn intact.

Sizing Materials

SIZING

Pure.	Medium and Heavy.
1. Adhesives or agglutinants.	1. Adhesives or agglutinants.
2. Softeners.	2. Softeners.
3. Antiseptics.	3. Antiseptics.
	4. Fillers.

Adhesives or Agglutinants

(*a*) Wheat flour or other flours from various starchy grains like *jowar*, *bajra*, rice, etc.

(*b*) *Starches.*—Sago, maize, farina, tapioca, arrowroot, etc.

Of these, wheat flour, sago, maize and farina are being used extensively in the industry. Starches can be distinguished correctly only by microscopic examination, but for practical purposes the tests by feel and degree of whiteness are considered adequate.

Wheat starch ..	Mellow feel.
Sago starch ..	
Farina	
Maize starch ..	Harsh feel.

Another handy method of distinguishing starches is the determination of the gelatinizing point. Starches are primarily composed of granulose and cellulose, with certain percentage of foreign matters like gluten, gum or sugar, fat or oil, ash and water. When starch is heated to a high temperature, cellulose breaks and granulose goes into solution with water known as apparent solution. This process is known as gelatinization.

Gelatinizing Point (Temperature)	
Wheat starch	70° C.
Sago starch	72° C.
Farina	65° C.
Maize starch	70° C.

If starch is boiled with water containing only .5 per cent. of caustic soda, a paste is formed which is much thicker and very much more adhesive than if it is boiled with water alone. A higher percentage of alkali products will give a greater adhesiveness. These substances also tend to prevent the decomposition of the starch paste, specially if the paste contains potato starch. If starch is boiled with cold concentrated solution (20 to 22 per cent.) of caustic soda, it swells up, forming a paste of greater tenacity, resembling in appearance a mass of gluten obtained from wheat flour. The starch so treated does not lose much of its adhesiveness on boiling even when the alkali is previously neutralized with acids. While cold, the neutralized starch is converted into a thin liquid, but on boiling, it is found to be nearly as tenacious as before. Advantage is taken of this fact to place on the market many patent substances for sizing purposes. These are generally starch boiled with water and caustic soda or starch treated with concentrated caustic soda in cold. Some of these substances are Penetrose, Eclipse, Anilose, etc.

These starches can be grouped as regards their uses in pure, medium and heavy sizing as tabulated below:—

No.	Pure	Medium	Heavy
1	Wheat	Wheat	Wheat
2	Sago	Sago, wheat	Sago, wheat
3	—	Maize, wheat	Maize, wheat
4	Farina	Farina, maize	Farina, maize
5	Penetrose	—	—
6	Eclipse	—	—
7	Anilose	—	—

Softeners

Mutton and beef tallow, vegetable tallow (hardened vegetable oils), tallow substitute (groundnut oil, cotton-seed-oil, coconut oil, etc.), castor oil, olive oil and Turkey-red-oil.

Mutton tallow takes the pride of place in its use as softener, though often vegetable tallow and sometimes castor oil and olive oil are used for the purpose. Being much in use on a commercial scale, mutton tallow is commonly marketed in an adulterated state. It is adulterated by—

(*a*) Substances which lower the commercial value of tallow, i.e., soap, bone or marrow fat, cotton-seed-oil and water.

(*b*) Substances which are definitely harmful to the cloth, particularly if the cloth is intended to be bleached afterwards, i.e., paraffin wax or oil, wool grease and recovered Yorkshire.

The adulteration being with various substances which are harmful either to the cloth or to the size mixing, it is always wise to select a brand after a complete series of tests.

(i) Tallow vaporizes between 260° F. to 300° F. though in summer vaporization may begin from 240° F. The higher the vaporizing point, the better the quality of tallow.

(ii) Presence of soap forms frothing in the surface of tallow when heated.

(iii) Presence of marrow fat shows a granular appearance and that of bone fat gives a pasty appearance. Both of them contain calcium phosphate, which can easily be detected by ammonium molybdate test.

(iv) Adulteration with mineral oils will lower the vaporizing point and give a characteristic smell.

(v) Adulteration with water is detected simply by heating tallow which will issue crackling sound.

In a more detailed test, saponification value for the presence of free mineral oils and acid value for the presence of free fatty acids can be determined. Presence of inorganic acids like H_2SO_4 and HCl can be detected by $BaCl_2$ and $AgNO_3$ tests.

Antiseptics

Zinc chloride, boric acid, copper sulphate, phenol, salicylic acid and shirlan (anilide of salicylic acid).

The conditions of a satisfactory antiseptic may be enunciated as follows :—

(i) It should not volatilize during the boiling of the size mixing or during the drying of the sized yarn.

(ii) It should be sufficiently soluble to ensure uniform distribution in the size mixing.

(iii) It must remain unaffected by heat, specially in contact with metallic surfaces, or it should not interact with the ingredients commonly used in size mixing.

(iv) It must not have any appreciable colour or smell and it should not develop any colour by coming in contact with acidic, alkaline or metallic salts.

(v) It must not react with cotton.

(vi) If used in a cloth that is to be dyed or finished subsequently, it must not affect these finishing processes.

Antiseptics are used to stop the growth of "mildew" in the cloth which is injurious to cloth due to the following reasons :—

(i) It forms a type of musty smell in the cloth.

(ii) It stains the cloth.

(iii) It tenders the cloth in the long run.

Zinc chloride is the antiseptic generally used in mills. It is marketed in the form of solution of 100° Twadell and is being prepared by dissolving commercial zinc in HCl (hydrochloric acid). Commercial zinc "spelter" is not pure zinc in itself; moreover, zinc chloride is adulterated by the sellers.

The foreign substances in $ZnCl_2$ can be classified in two definite groups :—(i) Substances, non-harmful, which simply help sellers to make more profit, viz., NaCl, Na_2SO_4 and $MgCl_2$. (ii) Substances, definitely harmful, which render injury to the cloth, viz., free acid, ferric chloride and plumbic chloride.

Free acid tenders the cloth, because cellulose is oxydized and thus the tensile strength of yarn is lost. Iron compounds (ferric chloride) cause iron stains in the cloth which are very difficult to remove if they are formed once. The presence of lead-compound (plumbic chloride), however, is reckoned the most objectionable. It is responsible for very insidious damage to cloth even if it is present in small amounts. It is not easily washed out from the cloth and remains in it as lead-oxide after alkaline scouring. When the cloth goes to be "chemicked," i.e., treated with bleaching powder solution, lead-oxide is converted into the peroxide of lead. If this cloth is boiled with alkali a second time as it happens in the after-treatment in the process of bleaching, the cloth is oxydized and consequently tendered by the peroxide.

Experience tells us that when using wheat flour in sizing, 1 part of $ZnCl_2$ is enough for every 8 parts of dry flour in order to make the cloth immune from "mildew." Starch, however, is not as much a medium for the growth of "mildew" as wheat flour is; consequently 1 part of $ZnCl_2$ will sterilize about 12 parts of starch. This proportion of agglutinants and antiseptics holds good when the warps run reasonably dry. But if the warp or the cloth is allowed to get damped and then packed in bales, this proportion may not always prevent mildew-growth. Smaller quantities of other antiseptics together with $ZnCl_2$ are to be used to inhibit the bacterial growth on the cloth. The following can be taken as the best composition of an antiseptic for such purpose.

Zinc chloride	. . 12.8	20 per cent. of the solid flour.
Boric acid	. . 4.0	
Copper sulphate	. . 1.0	
Salicylic acid	. . 1.0	
Phenol . .	. . 0.6	
Shirlan . .	. . 0.6	

In spite of all these difficulties, $ZnCl_2$ is extensively used simply because of its favourable properties. It is colourless, odourless and deliquescent. Owing to its deliquescent property, it is specially advantageous in medium and heavy sizing as it assists in adding weight. $ZnCl_2$ has a softening effect, too. Thus a cloth containing about 20 per cent. of flour in which only 2.5 per cent. of $ZnCl_2$ has been added will show the percentage of size as 25 per cent., because of the fact that $ZnCl_2$ has attracted extra moisture of its own weight.

Antiseptics like boric acid, copper sulphate and phenol are not commonly used, due to their colour and odour. Salicylic acid is in use only rarely when $ZnCl_2$ is not available or is out of stock and only 1 part for 15 parts of $ZnCl_2$. Shirlan, of course, has an extensive use, because it fulfils all the requirements of a good antiseptic and can be had without adulteration. The only drawback in it is that it is not soluble to a great extent like $ZnCl_2$, but its moderate solubility does in no way prevent it from being uniformly distributed through the mixing. Shirlan is about 40 times as toxic as $ZnCl_2$ and hence its substitution is cheaper in the cost of mixings, though pound for pound it is more costly than $ZnCl_2$. Considered in all aspects, Shirlan seems a better antiseptic than $ZnCl_2$.

Fillers or Adding Materials

China-clay, french chalk, barium sulphate and calcium sulphate. Magnesium sulphate and zinc chloride are also used as weighting materials though they are intended more for antiseptics.

China-clay is in a class by itself and is most prominent in its use as weighting material. It is composed chemically as aluminium silicate. While mined it is found mixed up with sand, undecomposed felspar and mica. China-clay is prepared for the market by simply removing these foreign ingredients which are injurious to the healds and reeds. These foreign matters are gritty in nature and their removal is effected by the physical process of "Levigation" and, therefore, removal of these matters is not secured. A simple test could prove whether china-clay is free from grit.

Test.—China-clay is mixed with water and a thin paste is made. A part of this paste is placed on a glass plate which is covered with another glass plate. Now, the glass plates are moved with a rotary motion in opposite directions with a considerable amount of pressure. This will make a grating noise from within if the china-clay is not genuine. The absence of such noise proves the absence of gritty matters in china-clay.

Chemical value of china-clay for sizing purposes depends more on its physical properties than on its chemical composition. Clays are, therefore, evaluated by (i) colour, (ii) feel, (iii) freedom from gritty matters and (iv) freedom from calcium and iron compounds. Number (iv) is of chemical character and can easily be tested for its presence. The remaining three characteristics are simply of physical type and their tests depend on comparative character and personal experience. As regards colour, small heaps of clay under examination are to be placed on a blue paper adjacent to each other and pressed flat. The colour can now be readily distinguished by contrast against the dark background.

Low grade china-clays are yellowish in colour and are often improved by topping them with some blue colouring matters. Such clays are likely to fade by exposure to light or other chemical agencies and expose their natural colour any time after use. Genuine whiteness of a clay has, therefore, to be carefully distinguished from faked or fabricated whiteness. The topping is generally being done either by a basic colour or a direct colour or ultramarine. They can be detected by a simple chemical test as such.

Equal quantities of clays are taken in watch glasses and water is added to each of them. Number one glass is left as it is, number two is mixed with hydrochloric acid, number three is being added up by ammonium hydroxide and acidified bleaching powder is added to the last.

Nos.	Experiments	Observations	Inferences
1	Clay and water.	As it is	Genuine clay
2	Clay and HCL.	Change in tone.	Ultramarine is used.
3	Clay and NH_4OH.	Change in tone.	Basic colour is used.
4	Clay + acid + bleaching powder.	Change in tone.	Basic or direct colour is used.

French chalk is obsolete. Barium and calcium sulphates produce a harsh boardly feel to the yarn and result in wear and tear of the healds and reeds. The only favourable point in their use is that they are of high specific gravity, i.e., weight.

Magnesium sulphate is chiefly used for bleached, coloured and mercerized sorts where it is desired to add some weight without detracting from the appearance of the yarns. Being soluble in water it is readily absorbed by the fibre, giving it a substantial feel and weight. It is, however, not a good substance to use in conjunction with starch as they tend to react on each other and produce dusty mixings.

Certain substances like caustic soda, Activins and gums (Kerin or Arabic) are often found in use in the size mixings. The object with which they are used is to improve the "feel," "penetration" and adhesiveness respectively. They are always used in small quantities.

Proportion of Ingredients

The proportion of ingredients in a mixing hardly follows any firm and fixed rule. A 15 per cent. mixing may be made to put up only 10 per cent. of size on the yarn if so intended. The fallacy lies in the conditions of the sizing machine, namely, the surface speed of the drag roller, wrappers of the squeezing roller and the quantity of steam into the sow-box. The chief point in this connection would be to see that the waste of sizing materials is reduced to a minimum figure and that the yarn sized maintains a normal condition, that is, neither damped nor scorched.

The figures tabulated in the following chart have been worked out while the conditions of the sizing machine are such:—

(i) Surface speed of the drag roll as 28 to 29 yards/minute.

(ii) Squeezing roller being wrapped with flannel (not new) only.

(iii) The flow of steam into the sow-box is just sufficient to make mild frothing on the surface of mixture.

Percentage size as well as that of sizing materials to prepare such mixing have been shown in the same column of the chart. The figures after experiments have been carefully calculated correct to the third place of decimal; yet, any further correction or alteration will be thankfully acknowledged.

Preparation of Mixing

It is always a sound rule to get flour fermented before it is used in mixings. In a beck with a stirrer moving continuously, the requisite amount of water is kept and flour is added, bags after bags, to make the final ratio of water and flour pound to pound. The mixture is now kept stirred for about a month, minimum period for this process should be below 15 days. 0.5 per cent. of Activin S on the weight of flour is to be added to the mixture to accelerate the process. Generally, in a standard beck of 5′ x 5′ x 5′ we take 16″ (200 gallons) of water and add 5 bags (1,000 lbs.) of flour on the first day, 3 bags (600 lbs.) on the second day and 2 bags (400 lbs.) at last and keep the mixture with stirrer working for three working weeks in the least. 3, 4

or 5 such becks are to be installed, according to the volume of work, to keep the supply of fermented flour continuous.

The measured quantity of water which is previously mixed up with caustic soda (wherever caustic soda is used) is stirred regularly with starches in the cold state for some time till a homogeneous mixture is obtained. Starch and gum are to be mixed preferably in the dry condition so as to leave no excuse for gum particles clinging together. The use of gum-arabic, however, is entirely of a different kind: it should be kept in water for about a couple of days so as to ensure uniform mixing. Steam is now let in to make the mixture lukewarm. Steam is cut off and Activin S (wherever Activin S is used) which is previously dissolved in water is added to the mixture. Steam is again let in and the mixture is boiled for a considerably long time till the mixture gets colloided. Steam is cut off, stirrer working throughout, tallow is added and the mixture is kept agitated till the last trace of tallow melts. Steam is again opened and continued for a considerably long time till the mixture gelatinizes. The mixture is kept agitated for about half an hour by the stirrer and with no steam before it goes to the sow-box.

Before adding to a mixture, china-clay is put into a mill where it is boiled with water for 1 to 4 hours, depending on the class of mixing. The object of this boiling is to separate the particles of clay from each other. In light and medium mixings where comparatively large quantity of water is used, it is not necessary to boil quite as long as in heavy mixing where the ratio of water to the total solid is very small. Clays differ so widely in their physical properties and the feel they produce that it is a sound rule for a manufacturer never to change the brand of clay without very good cause. It is a matter of great difficulty to obtain a new clay to get the exact effect of the previous one. It is quite possible to have mixings from different clays, all other ingredients remaining the same, which differ in specific gravity by as much as about 50° Twadell and this will show why great difference will result in the cloth woven. This difference is due essentially to the size of the particles of clays. The clay that contains higher percentage of colloidal particles gives comparatively thicker paste than one in which there is higher percentage of larger-sized particles. A thinner mixing produces a harsh feel whereas a thicker one produces a smooth pliable yarn having good weaving qualities.

The Bombay Industrial Disputes Act, 1938

Procedure for Effecting Changes in Agreements

SECTION 77 (1) of the Bombay Industrial Disputes Act, 1938, provides that a registered agreement, settlement or award shall cease to have effect on the date specified therein or on the expiry of the period of six months from the date on which notice in writing to terminate such agreement, settlement or award, as the case may be, is given by any of the parties thereto to the other party. It is, however, open to the parties under section 77 (2) of the Act, to have the terms of a registered agreement changed or modified by mutual consent.

Some time back a question arose before the Registrar of Unions appointed under the Act as to who are to be considered parties to an agreement, settlement, etc., and what procedure should be followed for giving notice of termination, etc. The Registrar referred the matter to the Industrial Court under section 19 of the Act and the following is a summary of the reference and of the Court's decision:—

"On 9th January 1942 an agreement was reached between the management of the Podar Mills Ltd., Bombay, and its employees under section 30 of the Act regarding revision of rates of four-loom weavers. The agreement duly signed by the management and five elected representatives of the workers was registered by the Registrar on 10th January 1942. Thereafter, on 8th June 1943, three out of the five elected representatives of the workers who were then in the service of the mill, gave six months' notice under section 77 (1) of the Act terminating the agreement. Thereupon I intimated to the management that the agreement would stand terminated on and from 8th December 1943, but the management differed."

Bombay Industrial Court's Decision

"'Representative of employees' is defined in section 3 (29) as representatives not being more than five, elected in the manner prescribed by employees directly affected by the change from among themselves. There are no provisions in the Act or Rules as to—when the election takes place according to Rules—how long it stands good, whether the vacancies are to be filled and if so, when and how, whether in the absence of some of the elected representatives, owing to death or cessation of service, the remainder can act. The reason for this omission appears to us to be that the election is to be made for a particular 'change,' and once the purpose of the election comes to an end, the representatives become *functus officio*. The representatives do not form a sort of Standing Committee of the employees in a position to represent them in all circumstances. The employees affected by different changes may not be the same and, therefore, the representatives once elected by employees affected by one change may not be able to represent employees when other change is contemplated affecting other employees. Otherwise we shall have to have separate standing 'representatives' of spinners, weavers, etc. We have had cases where spinners on one floor of the mills are affected and not spinners on other floors. Moreover, the employees themselves may wish to be represented by a different set of representatives, having regard to change that is contemplated. Some leaders of the employees may hold strong views on hours of work, other on wages, etc. Representatives elected when the change contemplated is in respect of hours of work, may not prove to be suitable representatives when the change contemplated is a demand for wages, sickness benefits, etc. Our view is strengthened by the wording of rules 16 and 20. When a notice of change is proposed to be given by an employer, a copy of the intended notice is served on the Labour Officer who convenes a meeting (rule 14), *explains the purport of the intended notice*, and then representatives are elected who, under rule 16, *are representatives of the employees for the purpose of notice*. Similarly, when the employees desire a change, a representation is made to the Labour Officer who convenes a meeting of the employees (rule 18), explains the purport of the representation and then representatives are elected who, under rule 20, are deemed to be representatives of employees *for the purpose of representation*. Thus when the purpose of notice and representation is over, and the question as regards the particular change settled, they cease to be representatives of employees and become *functus officio*. What holds good for the purpose of change should, *pro tanto*, hold good for notice terminating an agreement which is also in the nature of a 'change.' We do not think the view, that representatives once elected continue to be such for all time and for all purposes and can act even if some of them are dead or have left service, can be accepted. There is some force in the contention of the mills that the representatives must act jointly. Some of the representatives that may have died or left service may have been the most trusted representatives and the remaining representatives could then hardly be said to be the real representatives of the employees. When the employees themselves give notice of the termination of agreement, it is a positive and deliberate act of employees of considerable responsibility and may be fraught with far-reaching consequences and, therefore, the management must be satisfied that it comes from persons who fully represent the wishes of the employees. For that purpose, it seems necessary that the notice should come from all the representatives of employees. We are, therefore, of opinion that for each occasion when a question of change arises (including the question of modification of a registered agreement, or termination of a registered agreement, settlement or an award), there should be a fresh election of representatives, whether the originally elected representatives are in the service or not, and election could be made from the employees directly affected by the proposed change."

C

Improvements in Drafting

V. R. C. : A New Type of Roller Covering

(Contributed)

COTTON, before being finally turned into yarn, is passed through speed frames and ring frames, where final thickness and uniformity are obtained by passing through a series of rollers. So the quality of the yarn depends to a certain extent on the nature and type of rollers through which it passes. The firm, yet cushion-like elastic, smooth, even and hard-wearing surface of these rollers ensures a gentle grip and even control over the fibre to produce a perfect yarn at low cost.

For many years it was believed in the spinning department that roller covers should be made of leather only. The claims of leather for roller covering are now known to every spinner. More recently there has been cork covering which, it is said, is better than leather. Efforts were made in the past to replace leather and cork covers with cots made from synthetic rubber, but tradition dies hard and the refusal to accept the new material continued for a long time. However, after many scientific and practical tests, Messrs. Vulcascot (Great Britain), Ltd., of 1, Lampard House, 8 Maida Avenue, London, W.2, have now put on the market their Vulcascot Roller Cots (V.R.C.) made from synthetic rubber. On account of their special features and enormous advantages, they are reported to have been used by many large spinning mills in England.

The first cost of this V.R.C. may seem higher, but in respect of running and upkeep costs and other features, it is claimed that they are cheaper in the long run than several other types. Each type of roller covering has special claims for special work, but all-round resiliency and flexibility are said to make them more adaptable for spinning trade use.

In the old and common method of leather covering, two different materials, each having different physical characteristics, are used and they require different types of adhesives. The process of roller covering, namely, cutting, measuring, pasting, fixing, etc., requires considerable skill, labour and time, because it is necessary to avoid variation in the natural product of leather skins whereby regularity is impaired. Continuous friction between top and bottom rollers causes rough surface on the leather rollers very soon and hence it is obligatory to grind them, which can be done only once or twice. They also require very often varnishing ; no doubt, varnishing improves and helps the drafting. In spite of all these, grooves are found in the leather rollers in a short time, which affect the yarn very badly and hence requires immediate replacement. This replacement of leather is done at specified intervals, which vary according to rollers for different frames ; roller cloth also has to be replaced at specified intervals. To avoid wastage and maintain efficiency, the length of these intervals should be determined by the actual man on the spot. Further, it is impossible to avoid seams in leather rollers. There are two seams, one for roller cloth and the other for roller skin. The slightest unevenness caused by any or both these joints seriously damages the quality of yarn. Moreover, leather being a natural product, it is not possible to get all the skins of uniform and even thickness except in the case of only the highest quality Persian skins, which are very rare and costly.

In the case of cork cots, as they are made from one piece, there is no seam as in the case of leather; besides, they can be pressed easily on the iron or steel roller. It is also said that they are more resistant to wear than leather and hence more durable. They can be also rebuffed three to four times, depending upon thickness, and hence are said to be cheaper and better than leather. In spite of all these advantages it is said that there are also some serious drawbacks. Firstly, it is a natural product. Secondly, it has not got homogeneous structure but is made up of a multitude of tiny grains which are held together by some type of glue or so. It is said that during mounting, fissures easily occur when expanded and pulled on the iron or steel rollers, such fissures being the reason for frequent thread breakages, a danger which is said to be completely eliminated by V.R.C. It is also said that one other trouble occurs during the working period, that many times one of the grains is dislodged which makes uneven surface, which is sure to affect the quality of the yarn to a great extent. Similar trouble is also said to be experienced during rebuffing.

V.R.C. coverings are said to be easy to mount and inexpensive to maintain. Only two machines, viz., one mounting and one grinding, are required. V.R.C. are made of one piece of synthetic rubber of uniform quality and can be mounted on the iron rollers on the "Dronsfield's Expander," or similar machines. The elasticity of V.R.C. is said to make this procedure easier than a fitting of leather or cork cots. They are easily slipped on the iron roller with a specially prepared rubber solution known as "Vulcascot Adhesive Cement", which gives a firm grip on the rollers and prevents the cots from slipping as the rollers turn round. V.R.C. can be precision-ground to a concentric finish if the wall of the cot has been worn out on the surface. After serving their normal lifetime on the spinning rollers they can be ground, i.e., buffed and used again for a further long period. This period will vary according to the type of work performed, but cases are reported of rollers showing practically insignificant sign of wear even after two years' running. V.R.C. are said to have been in use from five to ten years with no other attention than occasional rebuffing, and if desired, revarnishing.

V.R.C., it is claimed, can be used initially four to five times longer than cork and can also be rebuffed many times. Owing to their incomparably long life, grinding as well as mounting work is greatly reduced. It is also said that saving between V.R.C. and cork is much more than the saving between cork and leather.

The smoothness and uniformity of V.R.C. is said to ensure good spinning results. V.R.C. are claimed to lend the iron rollers the necessary elasticity and to reduce the thread breakages as far as possible. Owing to their high adhesive property thread breakages are further reduced to a minimum ; this ensures quick and uniform running of the spinning frames, the ultimate result being greater tensile strength and more evenness of the yarn, combined with an increased rate of production. Since it is said that V.R.C. gives greater adhesive strength than leather or cork covering, weighting can be reduced by approximately 20 to 40 per cent. Careful attention to this detail can produce a real economy in power consumption. Further, it is said that on account of the reduced weight, the fibres are not so compressed and the yarns manufactured by means of V.R.C. are considered round, soft and more pliable.

Every spinner has experience of rollers becoming permanently bad as a result of oil damage. It is said that V.R.C. are not affected by oil at all. This resistance to oil is claimed by the fact that there is absolutely no effect even though V.R.C. are immersed in lubricating oil even for a fortnight.

Susceptibility to atmospheric variation is also a disadvantage, but V.R.C. rollers are believed to be unaffected by it and do not get brittle. It is said that there is no wrapping round or sticking of the yarn by which there is less clearer waste. Further, they are seamless and there are, therefore, fewer yarn breakages. Moreover, the natural colour, viz. black, of V.R.C. does not cause discolouring of the thread but is advantageous as the spinner can see the running of the thread more easily from a distance.

The coefficient of friction of V.R.C. is extremely high, and this grip ensures uniform drafting. Control over fibre is more even because the rollers do not vary by more than one-thousandth of an inch even after two years of steady running. The fact that certain methods of roller covering either require early rebuffing or recovering is a proof that they have run "hollow" and become grooved, in some cases it is said by as much as fifteen-thousandths of an inch in a very short period which is bound to result in unsatisfactory fibre control and bad spinning, freedom from which is a very great advantage.

V.R.C. are highly resilient, producing a perfect cushioning effect, and they are regular in their structure. Being a man-made synthetic product, they can be adapted, it is said, to every individual requirement as to degree of resilience. This means that each type of yarn dealt with can be provided with rollers of the most suitable composition, specially in regard to their hardness, and actual tests in particular mills can be made to find out the proper compositions most suitable to their requirements.

V.R.C. form one homogeneous body on the foundation of the metal roller, which results in one wide rubber cushion running on to the fluted roller the whole of its length. Because V.R.C. can be varied over a wide range of substance for varying uses, so can the cushion effect be varied to get any desired result in smooth running and better spinning. This is seen in the difference of drawing untwisted sliver at the drawing frames and the final twisted roving from the speed frames. In the early processes at the Drawing and Slubbing Frames there is a tremendous volume of fibres to be controlled all the time, and due to homogeneous character, freedom from "Hollows and Bumps," V.R.C. are said to provide a valuable aid to the spinner.

Research on this matter of fibre bulk has further proved that even in the presence of different types of cotton fibre in the same mixing, with hair weights per centimetre from the lightest to the heaviest, V.R.C. select and control the different fibres, resulting in a better and stronger yarn. This problem is analogous to high draft spinning.

The part played by the front, middle and back top rollers of speed and ring frames is also very important. The continuous extra demand for very coarse, fine and special yarns required for war effort, besides increasing civil requirements and shortage and irregular supplies of raw materials, stores and machinery has seriously affected the back process of so many textile mills. As a result, special attention is now paid to the function played by front, middle and back top rollers and their effects on spinning from all standpoints.

Before covering or re-covering a roller, due consideration should be given to its relation and real function of drafting. Top metal rollers having a smooth surface are the real origin of constant trouble, though it is not an infrequent occurrence for the fibre to slip which is absolutely undesirable in the present high speed and high draft spinning machinery. The tendency to go on higher and higher drafts and to increase the production together with the reduction in back feeding machinery, wages, etc., calls for the strictest supervision of the type of covering required for covering front and even middle as well as back top rollers.

A new and successful method is believed to be exemplified by the V.R.C. The middle top rollers and, in special cases, even the back top rollers of ring spinning frames (over and above the usual practice in drawing and speed frames), may be covered, by V.R.C. which is said to make considerable improvement in drafting, resulting in better grip and better fibre control. Further, due to this, it is considered possible to increase the draft by 20 per cent. even on the existing old drafting arrangement, without affecting the quality of yarn. Alternatively, more strength and more regularity are said to be obtained in the yarn, if no increase of draft is desired or contemplated. This is said to be successful in both coarse as well as fine spinning.

Further, it is said that V.R.C. are also used in woollen spinning mills in England and that they can as well be used in jute and hemp industries.

OUR PERSONAL COLUMN

Sir Joseph Kay, Kt., Managing Director of W. H. Brady & Co., Ltd., recently returned to Bombay after a stay of nearly eight months in England.

Rao Bahadur K. Sanjiva Rao, L.T.M., A.T.I. (Manc.), who retired last year as textile expert to the Government of Bihar after twenty-two years' service in that province, has recently been appointed Director of Industries and Commerce, Jaipur State.

Mr. E. W. Perry, I.C.S., has been appointed Development Commissioner to be in charge of the post-war schemes of the Government of Bombay. He is coming over from the Government of India, where he had been serving since his relinquishment of the office of the Prime Minister of Kolhapur State.

Mr. P. C. Chaudhuri, Deputy Chief Controller of Imports, Bombay, has been appointed as Joint Chief Controller of Imports, New Delhi. It is likely that Mr. S. N. Mehta, Deputy Controller-General of Civil Supplies, will succeed Mr. Chaudhuri as Deputy Chief Controller of Imports, Bombay.

Mr. J. B. Greaves, C.B.E., M.L.A., J.P., Honorary Chief Controller of Raw Materials and Stores, Government of India, Bombay, has been appointed Sheriff of Bombay in succession to the Hon'ble Sir Shantidas Askuran. He was sworn in at the Bombay Secretariat on 14th December 1944.

Mr. Greaves is a member of the Bombay Legislative Assembly, a Justice of the Peace and an Honorary Magistrate. He is the Chairman of the Board of Directors of Messrs. Greaves Cotton & Co., Ltd., and was awarded the C.B.E. in 1941. He represented the Bombay Chamber of Commerce in the Provincial Legislative Council for a time, prior to his election to the Provincial Assembly. It will be interesting to recall that his father, the late Mr. Herbert Greaves, was Sheriff of Bombay in 1913 and it is doubtful if there is any other European family in Bombay who can claim a record of this kind. As Chief Controller of Raw Materials and Stores under the Textile Commissioner to the Government of India, a post where he serves in a purely honorary capacity, Mr. Greaves has done very useful work for the textile industry of this country.

Mr. Ismail M. Mansuri, B.A., proprietor of the Graduate Picker Works, Ahmedabad, has been appointed a member of the Leather Research Committee constituted by the Council of Scientific and Industrial Research, New Delhi. He received training in picker-manufacture from his father, Mr. Mahomed G. Mansuri, B.A., and places his technical knowledge of picker manufacture at the service of millowners in India who may desire to consult him.

Mr. Gerald K. Hall of Messrs. Robert Hall and Sons (Bury), Ltd., loom makers, has been elected Chairman of the Lancashire Chambers of Commerce Committee, in succession to Mr. Harold Parkinson, of Burnley.

Textile Machinery Export Group in England.—The following are members of the Executive Committee of the Textile Machinery and Accessories Industrial and Export Group:—Chairman, Mr. G. H. A. Sington (Platt Brothers & Co., Ltd.); Messrs. J. K. Anderson (Fairbairn Lawson, Combe Barbour, Ltd.); J. T. Gailly (James Mackie and Sons, Ltd.); Sir William Prince-Smith, Bt., O.B.E.

(Prince-Smith and Stells, Ltd.); A Livesey (Henry Livesey, Ltd.); D. Dickinson (Butterworth and Dickinson, Ltd.); R. C. Mather (Mather and Platt, Ltd.); R. Liddell (John Hawthorn & Co., Ltd.); T. S. Grieve (T. Grieve & Co., Ltd.); E. Wildt (Wildt & Co., Ltd.); H. D. Norris (Samuel Law and Sons); and F. J. Grimmer (Wilson Brothers, Bobbin Co., Ltd.).

Dr. John Eric Richardson, Principal of the Oldham Technical College, has been appointed Principal of the Salford Royal Technical College, in succession to Mr. J. C. Jones, who has been appointed Director of Education to the London Polytechnic.

Dr. Richardson was appointed to Oldham at the end of 1941 and took up the position in 1942. He is 39 years of age and went to Oldham from Hull Technical College, where he had been eight years, four as Lecturer in Electrical Engineering and four as Head of the Engineering Department. Previously he was on the staff of the Birkenhead Technical College. He graduated in engineering with first-class honours at Liverpool University at the age of 23, and took his Ph.D. degree.

Dr. Richardson has often admitted that when he went to Oldham he knew little or nothing of the cotton trade, but since then he has studied it and visited many mills. He has reorganized the Technical College and has particularly been anxious to try and revive interest among students for cotton spinning, having succeeded in getting day-time students in these subjects to be sent by firms during normal working hours.

Lord Derby, K.G., has recently resigned from the office of President of the Administrative Council of the Empire Cotton Growing Corporation, London, England.

At a recent meeting of the Executive Committee of the Corporation a letter was read in which Lord Derby explained that he felt obliged to ask the Corporasion to accept his resignation of the presidency of its Administrative Council. He intended to continue to take the same interest as heretofore in the work that the Corporation was carrying out, but he regretted that he was no longer able to participate actively in it. The Committee accepted his Lordship's resignation with very deep regret, and they recorded their great indebtedness to him for the invaluable assistance he had given to the Corporation as President of the Council since its incorporation in 1921. It was further decided to invite Lord Derby to become Patron of the Corporation, a suggestion to which he has gladly acceded.

Obituary

Mr. G. Arthur Schieren.

Information has just been received by cable of the death of Mr. G. Arthur Schieren, President of Messrs. Chas. A Schieren Company of 30–38, Ferry Street, New York, U.S.A., well-known tanners and manufacturers of superior leather belting, etc., on the 7th instant.

Rao Saheb B. V. Deshmukh, Managing Director of the Vidarba Mills, Ellichpur, Berar, was one of the passengers involved in a serious bus accident on the Amraoti-Ellichpur Road on 27th November and was killed instantaneously. Mr. Deshmukh was a member of the Provincial Legislative Council and was also a member of Indian Central Cotton Committee.

Credit Facilities for Textile Labour

Progress of Co-operative Societies in Bombay Mills

CENTURY MILLS EMPLOYEES' CO-OPERATIVE CREDIT SOCIETY, LTD., BOMBAY

Ninth Annual Report, 1943-44

THE year opened with 777 members. During the year 225 new members were enrolled and 55 members withdrew. Present strength is 947.

Share Capital

Share and subscription amount in the beginning was Rs. 42,171-11. The collection during the year was Rs. 9,739 and the refund was Rs. 2,757-9. The capital at present is Rs. 49,153-2, of which Rs. 46,925 constitutes the share capital.

Loans

Two hundred and fifty-five loans worth Rs. 28,880 were given to the members during the course of the year. The following is the classification of these loans with the purpose for which they were granted.

No. of Loans	*Purpose*	*Amount.* Rs.
4	To dig well	485
8	Redemption of mortgaged land	950
10	Purchase of land . .	1,405
5	Purchase of bullocks . .	455
1	Litigation	45
67	Building repairs and construction	7,485
73	Marriage.	9,015
32	Household	2,525
52	Old debt redemption . .	6,350
3	Ceremonials	165
255	Total Rs.	28,880

Fourteen cases of old debts were settled by the welfare officer and Rs. 382-1 were saved to them.

Profit

The net profit at the end of the year was Rs. 1,941-8-2 which together with Rs. 5-11-8 brought forward from last year makes Rs. 1,947-3-10, which is recommended by the Managing Committee to be appropriated as follows:—To reserve fund at 25 per cent. of the net profit as per society's bye-laws Rs. 485-6; to distribution of dividend at As. 2½ per each paid up share Rs. 1,419-11; bonuses Rs. 31-14-8; and balance carried forward Rs. 10-4-2.

SASSON AND ALLIANCE SILK MILL EMPLOYEES' CO-OPERATIVE CREDIT SOCIETY, LTD., BOMBAY

Fourth Annual Report, 1943-44

The year opened with 181 members. During the year 31 new members were admitted bringing the total to 202. At the end of the year there were 196 members.

Share Subscriptions

During the year Rs. 8,000 was collected by way of monthly subscriptions; and Rs. 971 was refunded. The balance at the close of the year stood at Rs. 20,204-9-9.

Long and Short Term Loans

During the year long-term loans amounting to Rs. 10,035 were paid. Short-term loans amounting to Rs. 210 were paid.

Reserve Fund

The reserve fund stands at Rs. 760-15. If this year's proposed amount of Rs. 144 is added to it, the reserve fund will amount to Rs. 904-15.

Saving Account

In order to give every sort of facility to the members, they have opened a saving account in order to enable them to deposit their savings and they allow 2 per cent. interest on such deposits up to a maximum of Rs. 1,000. At present they have eight accounts with Rs. 390 to their credit.

Distribution of Profit

Net profit for the year after deducting the expenses amounts to Rs. 576-0-3.

The committee proposed that out of this the following appropriations be made:—25 per cent. of the net profit to the reserve fund Rs. 144; honorarium to auditors Rs. 50; and bonus to staff Rs. 22.

The committee proposed paying a

dividend of 2½ per cent. on the paid-up share subscriptions.

THE DAWN MILLS EMPLOYEES' CO-OPERATIVE CREDIT SOCIETY, LTD., BOMBAY

Tenth Annual Report, 1943-44

At the commencement of the year the membership was 1,221. The number of new admissions was 96, and withdrawals 53. Thus the year ended with a strength of 1,264 on the rolls.

Share Capital

The total amount of share capital at the commencement of the year was Rs. 67,823-11. During the period the society has collected Rs. 17,607-5. A sum of Rs. 2,756-8 was refunded to members, who ceased from the society. Thus the balance at the close stood at Rs. 82,674-8.

Deposits

The deposit amount at the credit of the members at the beginning was Rs. 18,172-2-9. Rs. 18,317-4-6 were collected during the period, and Rs. 11,615-13 were refunded. The balance at the close of the year stood at Rs. 24,873-10-3.

Loans

The amount of loans granted to members during the period was Rs. 1,62,415. The classifications of these loans with their purposes are as under:—Repayment or debts Rs. 50,980; marriage and religious ceremonies Rs. 30,890; Land purchasing Rs. 29,300; cattle purchasing Rs. 3,500; agricultural operations Rs. 20,500; and miscellaneous purposes Rs. 27,245. Total Rs. 1,62,415.

Profit

The transactions of the society have resulted in a gross profit of Rs. 5,582-12-6. After deducting the following items, as per provision under bye-laws No. 49/A and 49/B. :—Interest on deposit Rs. 428-13 and Working expenses Rs. 860, and with Rs. 2-10-4 brought over from last year's account, the society has a profit of Rs. 4,296-9-10 available for distribution, and the committee recommends the following distribution be made thereof:—Reserve fund at 25 per cent. Rs. 1,073-8; dividend at 4 per cent. Rs. 2,968-11; dividend equalization fund Rs. 50; Investment depreciation fund Rs. 150; charity Rs. 30; textile technical school Rs. 20; and carried over Rs. 4-6-10.

Sitting from left to right:—Messrs. A. S. Benjamin, Storekeeper; G. K. Rane, Timekeeper; B. Fernandez, Assistant Manager; H. Hargreaves, Manager; C. Fernandez, Spinning Master; N. R. Korgaonkar, Head Clerk; D. D. Mistry, Labour Officer.

REVIEWS

Substitutes. By H. Bennett. Published by Chemical Publishing Co., Inc., Brooklyn, N.Y., U.S.A. 1943. Price $4.

This is a useful handbook of substitutes and alternatives for chemicals, metals, fibres and other commercial products, including a plan for choosing proper substitutes. Substitutes have sometimes been used to reduce costs, sometimes to replace unobtainable materials and sometimes to produce better or different properties. Since no material has all the identical properties of the material which it is intended to replace, selecting a proper substitute must always be a task of considerable difficulty. A replacement that will produce a finished product which will perform almost the same function as the original is, therefore, considered ordinarily satisfactory. Further, because of the uncertainty of the continued availability of any substitute material it is desirable to try out a number of materials in each problem, so as to have a substitute for the substitute used. Although this may mean additional work, it is worthwhile for ensuring continuity in business. The book under review embodies in convenient form the result of years of experience of several chemists, engineers and technical workers and is bound to be of great assistance to the industrialist as well as the research worker in the laboratory.

The Indian Textile and Engineering Diary, 1944. Published by John Worrall Ltd., Oldham, England. (Indian Agents : W. H. Brady & Co., Ltd., Churchgate Street, Bombay.)

This well-known annual publication about the textile industry is compiled as a medium to develop and further mutual trade relationships between the makers and merchants of textile machinery, accessories and the textile and allied firms in India to whom it is distributed *gratis* ; it is now in its 55th annual edition. Due to the reduction in the size of the publication, the entries regarding Indian mills have been made in a form different from those in previous years. The paper situation in England has necessitated a reduction in the size of the Diary and the tabular form of type-setting has had to be given up. But opportunity has been taken to include additional information in the particulars relative to each mill, which have been augmented by details of the type of yarns and fabrics manufactured, cloth widths, selling agents, retail depots, etc.

The war, it is well to point out, has not hindered research and technical progress in the British textile engineering and other allied trades, and the accumulated benefits of several years of experimentation and invention may be trusted to have very marked effect on all phases of spinning, weaving and processing. In the advertisers' announcements in this Diary is available a wide choice of machinery, accessories and mill supplies, justifying its claim to be an authoritative catalogue for all mill requirements, in addition to its general value as a diary and complete directory of the Indian textile industry.

Yarn and Other Calculations for Cotton Students. By N. G. Devadhar, L.T.M., Bhide Colony, Sholapur. Price: Rs. 2-8.

The book under review should be a great help to students in cotton textile schools and to mill apprentices who are called upon to work out several calculations every day. Calculations are restricted principally to counts of yarn, and those dealing with mechanical details have been omitted in order to ensure the appearance of a compact little volume. Exercises and examples, supplemented by an appendix giving the count equivalents of other than cotton yarns to cotton yarns, adds to the value of the book.

Federation and Labour Legislation in India. By Sir Atul C. Chatterjee, G.C.I.E., K.C.S.I. Reprinted from *International Labour Review*, April-May 1944. Price: 6*d*.

Sir Atul C. Chatterjee, who was one of the delegates of the Government of India to the First Session of the International Labour Conference, held at Washington in 1919, was for some twenty years thereafter closely associated with many of the activities of the International Labour Organization and represented the Government of India at a number of meetings of the Governing Body of the International Labour Office and sessions of the International Labour Conference. In 1927 he was elected by the Conference as its President, and in 1933 by the Governing Body as its Chairman. In this latter capacity he led a delegation of the Governing Body to the World Economic Conference in London. Sir Atul, who has served in the Indian Civil Service and has had considerable administrative experience in

India, was for a time Member in charge of labour questions of the Viceroy's Executive Council and was responsible for dealing with a number of measures in the Indian Legislature which came before it as a result of the consideration given by the Government to the decisions of the Washington Conference.

The subject discussed by Sir Atul in the booklet under notice is of great topical interest, as important labour measures are now under consideration in the country. In the post-war years, labour problems are likely to loom even larger, and it is thus necessary to begin the study of labour's place in whatever constitution may be devised for the country. Sir Atul's weighty and scholarly discussion of the subject will, therefore, be welcomed as well by India's constitution-makers as by students of Indian labour problems.

NOTICES

Report on Staple Length of Indian Cotton Crop of 1943-44 Season. Published by the Indian Central Cotton Committee, Bombay. Price: Re. 0-4-0.

The following rough distribution into staple length groups of the official figures of production for the current and the previous seasons is shown:—

(Thousand bales of 400 lbs. each.)

Staple length group	Government Forecasts	
	1943-44	1942-43
Long staple, over 1"	363	270
Medium staple, A1"	291	319
Medium staple, B, ⅞" to 31/32"	2,506	2,146
Short staple, A, 11/16" to 27/32"	777	730
Short staple, B, 9/16" to 21/32"	502	468
Short staple, C, 17/32" and below	655	621
Total ..	5,094	4,554*

*This has been revised to 4,702,000 bales in the April 1944 forecast.

It will be seen that the production of staple length ⅞" and above during 1943-44 formed 62 per cent. of the total against 60 per cent. in the previous season.

J. K. Review, Vol. 5, No. 2, includes an interesting article on some problems of social security by Mr. S. K. Pramanik, Vice-President of the All-India Trade Union Congress.

G. E. C. Osram Bulletin July 1944 (published by the General Electric Co., Ltd., Magnet House, Kingsway, London). The issue under notice includes highly informative articles on the science and art of lighting and on infra-red lamp heating in industry.

Studies on Foliar Hydration in the Cotton Plant. By E. Phillis and T. G. Mason. Price 2*s.* 6*d.* **Studies on the Partition of the Mineral Elements in the Cotton Plant.** By T. G. Mason and E. Phillis. Published by the Empire Cotton Growing Corporation, 37, Inner Park Road, Wimbledon Common, London. Price 2*s.* 6*d.* These bulletins describe the result of the experiments carried out at the cotton research station of the Association at Trinidad.

Improved Single Process Lap Making is the title of a new illustrated booklet issued by the well-known textile machinery makers, Platt Bros. & Co., Ltd., Oldham, England. It describes a single process from bale-opening to lap forming entirely automatic in operation. In this system cotton is carried from one unit to another by means of air currents, and allows the extraction of large quantities of the finer dust. The evenness of the supply of cotton is ensured by the instantaneous and unerring action of electricity.

The difficulties of producing perfect laps are believed to be greater to-day than ever before. Among the important factors responsible for these difficulties are the extended use of high density baling, the greater variety of grades owing to the extension of cotton-growing areas, the higher percentage of deleterious matter (particularly in cotton arrivals from the newer fields), a persistent demand for the diminution of dust in cotton mills generally and a demand for less damage to the cotton and for more perfect opening and cleaning, to ensure a more efficient functioning of the card. The latest single process system of lap-making so well described in the booklet under notice is believed to have the advantage of requiring less machinery for a given output, of requiring less labour, and producing superior quality.

The Indian Agents of Platt Bros. are Indian Textile Engineers, Ltd., 143, Medows Street, Fort, Bombay.

Internal Lines of Communication

(*Concluded from page* 170)

issue of fifteen during the month, and only about twenty-five pieces remaining, it would be advisable to order a few more pieces of that particular item.

It must be remembered that the above system is only intended as a guide and, of course, the officer must be guided by his own requirements and experience. At any rate, the system acts as a reminder as well as acquainting him with his real position. It does not take more than fifteen minutes to examine the complete ledger of the stores of a big department, and it must be admitted that it is time well spent.

It is possible to proceed indefinitely with elaborations of this system and even to invent new ones. I feel, however, that enough has been said to give the reader a fair idea of how a modern stores can be run without causing unnecessary fraying of tempers.

Warning to Textile Trade

"Put Your House in Order Before 31st January"

Textile Commissioner's Speech at Bombay Rotary Club

THE shock as a result of the action taken by the Government of India during the months of April and May by assuming the control over two mills and controlling the distribution of production of 12 others, as also the drastic action taken by the Provincial Governments has now begun to wear off, and during the last two months and over black marketing in cloth and yarn has been steadily on the increase and assumed proportions when something drastic has got to be done, said Mr. M. K. Vellodi, Textile Commissioner to the Government of India, in a speech before the Rotary Club of Bombay on 5th December 1944.

He added: "To my mind there are only two methods in which this problem can be tackled. One is for the Government to acquire physical possession of every yard of cloth and every pound of yarn that is being produced by the textile mills in this country and ration these quantities to the consumer. The other is to allow the distribution of these goods through the ordinary channels of trade, subject to such safeguards as the ingenuity of the Textile Control Board and the Government could devise. It has been asked why, if Provincial and State Governments can acquire physical possession of foodstuffs and distribute these on a rationed basis throughout the country, a similar procedure cannot be adopted in respect of cloth and yarn whose production is confined to a few hundred mills in the country.

Why Not Ration Cloth ?

"I do not say this is impossible, but unless production is rationalized and the varieties of cloth are reduced to manageable proportions, it would be unwise to undertake it. For the present and during the last year and a half the Government of India have been following the policy of leaving cloth and yarn to reach the consumer through the ordinary channels of trade. That this policy has not wholly succeeded is clear and it was only the other day that Sir Akbar Hydari at a meeting of the dealers in the Mulji Jetha Market in Bombay announced in very clear and unambiguous language that if before the 31st of January 1945 the dealers did not put their houses in order and substantially reduce the black marketing, the Government of India with the help of the industry and of the public of this country would unhesitatingly take the necessary steps to ensure that cloth and yarn do reach the consumer at reasonable prices and in reasonable quantities. I will only add that those words were not intended as an idle threat."

Mr. Vellodi traced the history of textile control and the position of cloth and yarn supply in this country immediately before and after the declaration of war.

He said: "**Our annual production of cloth in the textile mills before the war used to be roughly 3,500 million yards, handlooms produced on an average about 1,600 million yards of cloth, and we used to import about 800 to 900 million yards. Our pre-war export of cloth was small and never exceeded 100 to 150 million yards, so that on a rough computation we had about 6,000 million yards of cloth for distribution in the country. The position to-day is roughly that the textile mills in this country produce about 4,800 million yards of cloth per annum, handlooms account for nearly 2,000 million yards while there are no imports. Out of this production about 800 to 900 million yards are supplied to the defence forces and about 600 million yards are exported. The quantity of cloth available for consumption, therefore, is only about 5,300 million yards, a quantity extremely inadequate for the purpose of clothing the millions of this country.**"

No Increase in Profit Margins

It has been argued by the dealers and their representatives that the margins of profit allowed by the Textile Control Order are not adequate and that a slight increase in these margins would put things right. Under the Control Order cloth is to be sold in retail at a price not exceeding 20 per cent. over its ex-factory price. Out of this 20 per cent. it has been legislated that the retailer who sells the goods to the consumer shall receive 10 per cent. the other 10 per cent. being divided among the various stages of wholesale trade. On behalf of the dealers it has been suggested that an addition of 2 to 2½ per cent. to this margin would almost entirely eradicate the black market. This point might have been worth pursuing if all that the consumer has to pay to-day for his cloth were another 2 per cent. over controlled prices, but when the consumer cannot get cloth except by paying prices ranging from 20 to 60 per cent. over controlled prices the suggestion that an addition of 2 per cent. to the margin of profit would cure the evil appears ridiculous. The fact of the matter is that war profits have blinded the trade to their very serious responsibilities and the duty that they owe to the public of this country. The unavailability of cloth except at extremely high prices is particularly true of the finer varieties of cloth and here it is necessary to emphasize that only 6 per cent. of the yarn spun in this country by mills can be regarded as fine, and that very large quantities of fine yarn which we used to import from Japan and the U.K. are not now received in this country. Out of the fine yarns spun, quite a large percentage is used up in the manufacture of cloth borders and for making such cloth as poplins, so that the available quantity of what may be called fine cloth such as mulls and voiles is hardly adequate to meet the needs of even a small fraction of the public. On the other hand, there has been a substantial increase in the income of the average individual in this country and persons who never aspired to buy fine cloth before the war have been given the means to buy it, even at the inflated prices of such cloth to-day. The position thus is that persons living in Bombay City, for example, who are perfectly satisfied and are in fact glad to get rice of the second sort which Providence and the Supply Commissioner in their infinite mercy give to them, must have for wearing purposes the finest *dhotis* and *saris* that the textile mills in this country could produce. Apart from the various ways in which cloth tends to go underground one fruitful source of scarcity is thus the increased demands from the public and its apparently incorrigible habit of buying without any thought of one's neighbour. If every member of the public and particularly those of the upper ten would resist the temptation of buying cloth unless it was absolutely essential, part at least of the present constricted position would be resolved. To this I would add that the public should also refuse to pay prices which are higher than the controlled prices when making their purchases, as every time they do not do so, they are very actively assisting the black marketeer.

No Substantial Increase in Production Possible

Referring to the criticism that neither the Textile Control Board nor the Government of India have taken steps to increase the production of the textile mills in the country, Mr. Vellodi admitted that it was not entirely unjustified. He, however, stated that certain members of the Industry's Committee of the Textile Control Board have for some time been anxiously examining this problem in all its aspects. There are certain obvious obstacles in the way of further production on existing lines, the most important of which being the lack of an adequate supply of coal. It has been reckoned that the textile industry taken as a whole requires a supply of roughly 180,000 tons of coal per mensem for its satisfactory running, whereas the supply has never exceeded on an average more than 150,000 tons. There are other obstacles such as the fact that in order to satisfy the requirements of defence forces, many of the textile mills in this country have been obliged to go coarse as the saying goes, thus vitally affecting the overall production of cloth. There are other hindrances such as an inadequate supply of mill stores, so that it seems that in the existing circumstances no substantial increase of production can be achieved except by rationalization and standardization.

Standard Cloth

Referring to standard cloth, Mr. Vellodi said that during a period of 18 months the Government of India have placed orders for the manufacture of over 1,000 million yards of standard cloth of a total value of Rs. 48 crores out of which 865 million yards had actually been delivered to the Provinces and States. A very large percentage of this quantity had reached the consumer and, what is very important to remember, at controlled prices. That the distribution of standard cloth among the poorer classes of the people has filled and is continuing to fill a real need is the unanimous opinion of all the Provincial Governments and States that have taken part in the scheme.

Concluding, Mr. Vellodi said: "I believe textile control and its ancillary measures have very largely contributed to the arrest of the inflationary trend in prices generally in this country and with the co-operation of the public it can, to a large extent, achieve its ultimate object, viz., in making available to the majority of the public of this country cloth at controlled prices. The question has been asked, 'How long is this control likely to last?" It is not an easy question to answer but the indications show that some form of controlled economy is bound to continue as an integral part of the economic life of the country for a fairly long period after the war, if not for ever. I regard textile control as one of the most important of such controls and its continuance certainly for a good many years after the war, is, in my opinion, essential from the point of view of the public of this country."

Establishment of Handloom Board

The Textile Control Board discussed at its latest meeting in Bombay the constitution of the Handloom Board proposed to be set up by the Government of India, in the light of the views expressed by the provincial Governments, the millowners' associations and other interested bodies. It is understood that the meeting decided to recommend to the Government of India to constitute the Handloom Board. The meeting was presided over by Mr. Krishnaraj M. D. Thackersey and was attended, among others, by Sir Akbar Hydari, Secretary, Department of Industries and Civil Supplies, and Mr. H. M. Patel, Joint Secretary.

The proposal for setting up the Handloom Board was recommended by the Fact Finding Committee of the Government of India. The Board is expected to assist the handloom weavers in getting dyes, chemicals and stores at fair prices, undertake research in respect of the marketing of handloom products and make available to the handloom weavers much-needed yarn. The Textile Control Board entrusted the question of yarn supply to its Yarn Sub-Committee.

The tentative constitution of the Board provides that there will be 25 members, 15 representing the provincial Governments and the handloom weavers, four representing the Indian States and six to be nominated by the Textile Control Board to represent the millowners and the yarn merchants. The final decision in regard to the constitution of the Board will be taken by the Government of India.

Sir Akbar Hydari at Ahmedabad

Sir Akbar Hydari, Secretary, Department of Industries and Civil Supplies, Government of India, and Lady Hydari, arrived in Ahmedabad on 27th November 1944.

Sir Akbar visited a couple of mills and was entertained at a tea party by local dyers and printing associations. Sir Mahbub and Lady Kadri gave a luncheon in their honour at the Nowroji Hall.

At a Press Conference a representation signed by the editors of four local newspapers was submitted to Sir Akbar and discussed. The representation stated that despite the Government's efforts to control the prices of cloth and make it available to all, the desired results had not been achieved. It was further stated that the textile industry and trade interests had been mainly represented on the boards and committees appointed by the Government and popular interests were not represented. The figures of the cost of production supplied to the Government were very high, and in fixing the price of cloth, the Government had allowed too much profit to the mill industry. This fact was evident from the huge profits of the textile mills, as shown in their balance sheets.

It was further stated that black market was rampant in the city and that the consumer was forced to pay in the black market prices which were 50 per cent. on an average above control prices. The representation suggested that something drastic should be done to avoid the unfair margin taken by middle men and recommended that there should be a drastic cut on cloth exported to foreign countries.

Sir Akbar said that cloth was necessary next to food, and continued: " We have to see that the mills make cloth. Even the less efficient mill is set to work for the production of cloth. There are black sheep everwhere. Black market prevails in the finer counts, rather than in the coarser counts. Efforts are being made to remove black market; schemes have been evolved and are being tried to remove black marketing."

Sir Akbar said that if the middle man did not play fair then he would be wiped off. He was of the opinion that at present very few mills were making profits over 7½ per cent. and hardly a single mill about 20 per cent. on the cost of production. He declared that the standard cloth scheme was successful as far as it was expected to be, and " we propose to maintain it." He was of the opinion that the present exports could not be reduced but gave an assurance that they would not increase.

Sir Akbar also visited the Maskati Market Association.

Provincial Textile Controllers in Conference

Regular and frequent announcements* have recently been made by the Textile Commissioner in the Press, warning dealers to dispose of by 31st December 1944, those goods which will become time-barred by that date. At a conference of Provincial Textile Controllers in Bombay on 13th and 14th December, concerted measures were agreed upon to seize all such cloth illegally held on and after 1st January 1945, and every month thereafter, as goods texmarked January 1944 and later become time-barred.

Recommendations regarding the adjustments of profit margins of 20 per cent. between various dealers, yarn distribution and the control of handloom cloth were among the other questions discussed at the conference.

The Textile Commissioner desired to inform all concerned that the Bombay Cloth Distribution Panel would not issue, with immediate effect any more permits for the despatch of goods to the South Bengal and the Rajputana deficit zones during the month of December.

The difficulties experienced by retail cloth dealers in Bombay were placed before Pressmen by Mr. Jayanand N. Khira, President of the Federation of the Bombay Retail Cloth Dealers' Association, at a luncheon meeting arranged by the Committee of the Association to discuss the cloth control. He complained that the margin of profit fixed by Government was mostly eaten away by the millowners and the wholesalers, leaving the retail trade practically nothing.

Mr. Khira produced a number of cloth pieces to show that the stamping of prices was not done in conformity with the Government notification and stated that even the Provincial Textile Controller was not able to ensure a steady flow of goods to the 300 shops approved by him. He suggested that the interests associated with the distribution should be classified clearly, a rigorous check should be kept on the stamping of prices on the piecegoods, the margin of profit allowed to the manufacturers should be defined, and that his association should have a voice in the Textile Control Board.

Wider Powers Given to Commissioner

With a view to securing proper distribution of cloth and yarn, the Cotton Cloth and Yarn (Control) Order, 1943, has been so amended as to vest in the Textile Commissioner to the Government of India very wide and extensive powers of direction to manufacturers and dealers in regard to the distribution of cloth and yarn including powers to fix the dealer's margin of profit, says a Press Note issued by the Textile Commissioner.

In pursuance of this amendment, the Textile Commissioner has issued an order dated 16th December 1944, directing that no quota holder carrying on business in the city of Bombay or in the Bombay Suburban District shall sell or deliver any cloth purchased by him directly from a manufacturer or open any such bale of cloth except in accordance with the permission or direction issued by the Textile Commissioner.

This order comes into effect immediately and applies both to existing stocks of cloth and also to future deliveries from mills; in this connection quota holders are warned that failure by them to take deliveries of cloth from the mills will result in the forfeiture of all their quotas in the future.

Despatch of Cloth from Bombay : Procedure Outlined

With a view to remove any misunderstanding that may exist among the dealers about the present procedure regarding the despatches of cloth from the city of Bombay to destinations within or without the Bombay Surplus Area, the Textile Commissioner desires to make it clear that no permits are necessary for despatch of goods from one destination to another within the Bombay Surplus Area. Licensed cloth dealers and commission agents whose place of business is in Bombay city can alone obtain a permit for despatch of goods from the Bombay Surplus Area to destinations outside that area. Up-country dealers holding licences valid in their own Province or State or holding licences issued by the Government of Bombay but having their place of business outside the Bombay city limits, can make purchases in the Bombay market, but they will have to arrange for despatches to places outside the Bombay Surplus Area through dealers or commission agents who hold Government of Bombay dealers' licences and having their place of business within the city limits.

Government-Controlled Mills: How Their Production has been Distributed

About 100 million yards of cloth manufactured by the eleven mills in the Province of Bombay whose production is distributed under the direction of the Textile Commissioner to the Government of India have been allotted direct to different provinces during the six months ending October 1944. In terms of bales this is 65,782 bales. Out

---

*See the *Indian Textile Journal*, November 1944, page 119.

of this 56,436 bales have already been despatched to 10 provinces, 3 States and a Commissioner's province. The remaining 9,346 bales have already been registered for despatch and will move at an early date.

Despatch of Cloth and Yarn by Post

An amendment to the Cotton Cloth and Yarn (Transmission by Post) Prohibition Order, 1944, published in the *Gazette of India* of 18th November permits anyone wishing to do so, to send by post cloth and yarn to the following:—

1. The Textile Commissioner, Bombay.
2. Indian Central Cotton Committee's Technological Laboratory, Bombay.
3. Chief Inspector of Cotton Textiles, Bombay.
4. Controllers of Inspection, Bombay, Madras, Calcutta and Lahore and officers subordinate to them.
5. General Headquarters, New Delhi.
6. Chief Inspector of Stores and Clothing, Cawnpore.

An order of the Textile Commissioner published in the *Gazette of India* of the same date enables the cotton textile mills to despatch by post samples of standard cloth, when declared as such, to any provincial or State officer in India.

Cloth Transport By Sea

The Government of India have agreed to cover marine war risk insurance on cotton piecegoods and yarn transported by sea from Bombay to Calcutta for a further period of one month from 1st December, says a Press Note issued by the Textile Commissioner.

By a notification in the *Gazette of India* dated 18th November 1944, the Government of India have decided to exempt woollen cloth containing 40 per cent. or less of cotton by weight from the purview of the Cotton Cloth and Yarn (Control) Order, 1943. Such cloth will, however, be governed by the provisions of the Hoarding and Profiteering (Prevention) Ordinance. All woollen cloth containing more than 40 per cent. of cotton by weight will come within the purview of the Cotton Cloth and Yarn (Control) Order, 1943.

NON-CONTROLLED WOOLLEN GOODS

Maximum Retail Prices

The Central Government have fixed the maximum retail prices which may be charged by dealers in respect of Indian woollen goods other than controlled goods. The prices fixed are for the best quality material, and prices for lower qualities should be proportionately less. The maximum retail price of tweeds and woollen suiting manufactured from Indian machine-spun woollen yarns, for example, is Rs. 5-10 per lb. and that fixed for blankets and rugs manufactured from Indian machine-spun woollen yarns is Rs. 4 per lb.

The maximum retail prices for a variety of worsted cloth manufactured in India are: Rs. 26 per lb. for worsted cloth (suitings, shirtings, flannels), shawls, etc. manufactured from imported worsted or union (R. C. quality) yarns; Rs. 22 per lb. for worsted cloth manufactured from cotton warp or cotton twisted with imported worsted yarn, with cotton contents not exceeding 25 per cent., Rs. 18 per lb. for worsted cloth manufactured from cotton warp or cotton twisted with imported worsted yarn with cotton contents above 25 per cent.; Rs. 20 per lb. for worsted cloth manufactured from imported worsted and union (T. C. quality, etc.) yarns twisted with rayon or staple fibre yarn and Rs. 9-8 per lb. for worsted knitting yarns of Indian manufacture.

Men's Ready-made Garments

The Central Government have fixed the maximum retail prices which dealers who sell ready-made garments may charge on the basis of the cost of the material plus certain specified making charges.

The maximum price chargeable for worsted or heavy woollen suits is the cost of the material plus Rs. 30, for a palm beach, light woollen, half woollen or silk suit it is the cost of the material plus Rs. 25, and for a cotton suit or a suit of other material not included above it is the cost of the material plus Rs. 15.

The Controller General of Civil Supplies has directed all dealers to mark the sale prices on all men's suits exposed for sale and cloth exposed for being made into suits to order.

These maximum prices chargeable, under the latest order of the Government, by tailoring establishments and dealers in men's ready-made garments, relate to ordinary tailors and establishments. A competent officer has been authorized to certify some dealers as belonging to class A or class B. Thus there are three classes, namely, ordinary, class A, and class B. The maximum charges allowed to each of these groups are set out below in the order of ordinary, class A, and class B:—

Worsted and woollen: Rs. 30, Rs. 100 and Rs. 60.

Palmbeach, light woollens, half-woollens, half-woollens and silk: Rs. 25, Rs. 75 and Rs. 40.

Cotton and other materials: Rs. 15, Rs. 50 and Rs. 25.

Officers Responsible for Administration of the Cotton Cloth and Yarn (Control) Order, 1943 in the Provinces

1. **Madras.—S. Venkateswaran, Esq., I.C.S., Provincial Textile Commissioner, Madras Record Office, Egmore, Madras.**
2. **Bengal.—T. Jones, Esq., Provincial Textile Controller, P-34 Mission Row Extension, Calcutta.**
3. **Bombay.—J. K. Thakore, Esq., B.A., LL.B., J.P., Provincial Textile Controller, opp. Kala Chowki Post Office, Parel Road, Bombay.**
4. **U.P.—A. D. Pandit, Esq., I.C.S., Deputy Secretary to Government of U.P., Civil Supplies (B) Department, Lucknow.**
5. **Punjab.—P. T. Ensor, Esq., I.C.S., Assistant Director of Civil Supplies, Supplies Department, Punjab, Lahore.**
6. **C.P. and Berar.—A. G. F. Farquhar, Esq., O.B.E., I.C.S., Secretary to Government, C.P. and Berar, Commerce and Industries Department, Nagpur.**
7. **Bihar.—K. S. V. Raman, Esq., I.C.S., Cloth Controller, Bihar, Patna.**

8. **Assam.—M. H. Hussain, Esq., I.C.S., Additional Secretary to Government L.S.G. (Industries), Department, Shillong.**

10. **N.W.F.P.—A. J. Dring, Esq., Provincial Textile Commissioner, N. W. F. P., Peshawar.**
11. **Orissa.—B. Mukarjee, Esq., I.C.S., Deputy Secretary to Government, Department of Supply and Transport, Cuttack.**

Price Of Knitting Wool

By a notification issued under the Hoarding and Profiteering Prevention Ordinance, the Central Government have fixed the maximum selling prices chargeable by a dealer in respect of 14 different brands of knitting wool including Beehive Scotch fingering 3 and 4 ply, Diana 3 and 4 ply, Wendy Plain 3 and 4 ply, Wendy Baby, Crocheteen 3 ply, Lustre Wool (hand knitting Art Silk Yarn) and Pastorella.

Order on Silk Merchants

By a notification issued under the Hoarding and Profiteering Prevention Ordinance, the Controller General of Civil Supplies has directed all importers and wholesalers of pure and artificial silk yarn and silk fabrics in British India to maintain daily records of all sale and purchase transactions in respect of these yarns and fabrics and to submit to the Controller General of Civil Supplies, 1st Marine Street, Kalbadevi, Bombay 2, so as to reach him on or before the 15th day of every month separate statements of the stock position of these yarns and fabrics on the last day of the preceding month in a prescribed form showing the total stock, disposal during the month and the balance.

Profit Margin for Exports to Ceylon

The Southern India Chamber of Commerce have represented to the Government of India urging the revision of the allocation of the margin of profit for cloth exporters to Ceylon and other countries. They have pointed out that out of the present allocation of 20 per cent. margin over the standard price for export cloth, the millowners and wholesalers get between them 12 per cent. and the exporters with the remaining 8 per cent. have to meet export duty, Madras sales tax, railway freight, insurance premium, harbour dues and handling charges. The present allocation, the Chamber feel, is extremely unfair to Indian dealers and exporters and favours only the Ceylonese buyers.

15,000 Handlooms Idle in Chitoor District

It seems 15,000 handlooms are lying idle in the Chittoor District of the Madras Presidency. The demand for 60's (quality) yarn was very great, and the supply was very inadequate. Against the monthly quota of yarn of all varieties, ordinarily consumed which came to nearly 2,000 bales including all varieties of yarn, only 500 bales per month was allotted to the district. The supply of even these was coming very slowly and at irregular intervals.

Textile Control Board for Orissa

At a recent meeting of leading textile and yarn merchants held at Cuttack (Orissa), it was decided to form a Provincial Textile Control Board with 19 members. This Board will endeavour to facilitate sale and supply of textile goods in Orissa and also to root out black-marketing and profiteering in textiles and yarn. The sponsors of the move have approached the Government for its approval of the Board.

MADRAS CLOTH DEALERS' ASSOCIATION

Meets Provincial Textile Commissioner

The President and members of the Madras Cloth Dealers' Association met Mr. S. Venkateswaran, Provincial Textile Commissioner, and explained to him some of their difficulties in connection with retail business in textiles.

After tea, Mr. K. Balakrishna Mudaliar, President of the Association, welcomed Mr. Venkateswaran to the Association.

The dealers urged that wholesale licensees should not be allowed to keep retail shops also, that retail dealers should be assured of a quota of supplies arriving in the market, that steps be taken to end the present practice of wholesalers dumping unwanted varieties of cloth on retailers alongside varieties in demand and that the requirement as to submitting quarterly returns be changed to half-yearly returns. The Association also asked for representation on the Textile Advisory Committee.

Mr. S. Venkateswaran explained the present system of control and said that it was their desire to make it work smoothly and without hardship as far as possible. He appreciated the difficulty expressed by them in regard, for instance, to wholesalers forcing certain "unwanted" varieties along with the "wanted" ones. The wholesalers did this because, in their turn, they had under the quota system to take different qualities of goods produced by the mills.

While there were practical difficulties in making rules to stop such a practice, he expressed his belief that no retailer would be put to loss on account of taking goods on the mixed basis, though he realized it might mean some delay in realizing value. Where, however, retailers felt they were being unduly burdened with such "unwanted" goods, they could bring the matter to his notice and he would do the needful. He expected that when the system of quotas and linking of retailers to particular wholesalers was in full working, no dealer would find any difficulty in getting his supplies. On the question of returns, Mr. Venkateswaran said that it was essential that returns should be sent regularly by dealers as at present to show the actual stock position and it was in the interests of the merchants themselves to do so. Perhaps, at some future date, it might be possible to change over to half-yearly returns.

In conclusion, Mr. Venkateswaran told the dealers that while it might not be possible to shut out wholesalers from retail business altogether steps would be taken to see to it that no wholesaler discriminated against other retailers in favour of his own retail shop and no wholesaler opened new retail shops in localities where he did not formerly do business.

New Scheme of Cloth Distribution

Trade Proposals for Bengal

A "SCHEME for Distribution of Cloth in Bengal," has been submitted to the Government of Bengal by the Board of Textile Trade, recently constituted with representatives of 17 chambers of commerce and associations interested in the textile trade.

The consumers as also the traders in general in Bengal have been suffering for the last many months owing to shortage of supply and maldistribution. The control measures, so far adopted by the Government of Bengal, have not, from all accounts, been able to improve the situation even in regard to distribution, not to speak of procurement. It was, therefore, felt necessary that the trade representing all dealers from quota-holders to retail dealers should evolve a scheme for equitable distribution as also adequate procurement under Government supervision, if necessary, and with this end in view the Board of Textile Trade formulated a comprehensive scheme which was the subject matter of discussion when the Hon'ble Mr. H. S. Suhrawardy, Civil Supplies Minister, Bengal, received a deputation of the Board on the 30th October 1944.

The scheme envisages constitution of several panels for procurement, distribution, scrutiny, appeals, etc., as also committees in the mofussil, so that there may be an automatic control over distribution at controlled rates at all stages.

The following is the full text of the scheme:—

Constitution of Board of Textile Trade

The name of the Board shall be "Board of Textile Trade." The Board will consist of two representatives each of the recognized chambers of commerce and other recognized organizations having any interest in or concern with the textile trade. The Board shall have power to co-opt on it such persons as it may think fit and proper from time to time but the total number of such co-opted members shall not exceed one-tenth of the total number of elected members. The Board shall have power from time to time to invite all such person or persons for attending and taking part in the deliberations of its meeting.

Control of procurement, storage and distribution of piecegoods in Bengal should be vested in the Board known as the Board of Textile Trade. The Board shall be given full powers to enforce the provisions of the scheme under the Cotton Cloth and Yarn Control Order. Further, the Board shall be empowered with the powers to frame rules, collect returns and appoint persons and panels to exercise the powers of requisitioning goods, and to fix quota in case of difference and doubts and to exercise all powers and to do all acts that are necessary for the proper procurement and distribution of piecegoods in the province of Bengal.

Panels

For carrying out the different functions of the Board, there shall be formed from time to time such panel or panels as may be thought fit and proper by the Board. At present there shall be the following seven panels: Procurement Panel, Distribution Panel, Scrutiny Panel, Trial Panel, Appellate Panel, Publicity Panel and Finance Panel.

Each panel shall consist of seven members of whom two will be the Government officers, viz., the Provincial Textile Controller and the Textile Trade Adviser to the Government of Bengal and five will be the trade representatives to be elected by the Board.

In each important distributing centre of the Province of Bengal there will be formed mofussil committees under the control and supervision of the Board consisting of seven members out of which two will be the Government officials and five will be trade representatives to be elected by the traders of the area concerned.

Procurement Panel

It shall collect and compile all the necessary information and figures relating to the requirements of all the markets in the province and present supply through quota-holders, importers and other sources. All classes of dealers may import goods from surplus areas.

The goods allotted to the province of Bengal as a deficit zone, apart from the goods covered by the quotas and the imports by the importers as referred to above, received through the authorities, Central or Provincial, shall be procured by the Board and the Board shall distribute the same as it thinks fit and proper.

In case of any quota-holder or importer being no more in existence or being otherwise disqualified, the Board shall be entitled to procure the goods against his quotas and shall distribute the same as it thinks fit and proper.

Distribution Panel

Quotas amongst Dealers.—All the several classes of dealers, shall allot goods which have been received by them respectively against their respective quotas and imports to their respective dealers in proportion to the dealings that they had with them during the basic years on the basis of the amount of the turnover in value to the wholesalers at a fixed percentage over the ex-mill prices and to the commission agents and retailers at 10 per cent. and 4 per cent. over the ex-mill prices as the case may be. The goods which will be received by any wholesaler from his wholesale dealers on the basis of quota between dealer and dealer on the fixed percentage, shall not be subject to allotment by the dealer to any other wholesale dealer and these goods will be allotted by the said dealer only to the commission agents and retailers at 10 per cent. and 4 per cent. as the case may be on the basis of turnover during the basic period that they had with them. In case of any of the allotment holders from the quota-holders of "A" class (those who receive 50 bales or more per month) being no more in the trade the "A" class quota-holders concerned shall give to the Board the goods that would be left after giving to his existing allotment holders on the basis of the fixed rates as stated above and the Board shall distribute the same as it thinks fit and proper.

Retail to Retail.—The retailer may sell to other retailers and hawkers at the rate of 15 per cent. over the ex-mill prices and the mofussil retailers at the rate of 17 per cent. over the ex-mill prices.

Special Consumers.—Garment makers, dyers, bleachers and such other makers and hawkers having licences under the Control Order will be entitled to receive cloth from all classes of wholesale dealers (except commission agents) at the rate of 10 per cent. and 4 per cent. over the ex-mill prices, as the case may be in proportion to the dealings that they had with them during the basic years and on the basis of the amount of turnover in value.

Basic Period.—For distribution of quotas between dealers to dealers, the basic years 1940-41-42 will be applicable.

Inter-transactions.—Due adjustments of inter-transactions amongst dealers will be made before fixing the quotas of dealers to dealers.

Commission Agents.—Commission agents shall not be permitted to supply goods to any other person but to their own mofussil constituents who have had dealings with them during the basic years.

Quotas of Distributing Markets.—The Distribution Panel will fix the quotas for each market in the province and on the said basis, will also fix quotas between commission agents and their constituents after making necessary adjustments.

Remuneration of Commission Agents.—The commission agents shall charge their constituents the actual expenses and 1¼ per cent. commission as their remuneration.

Quotas for Calcutta and Industrial Area.—Separate quotas will be fixed for the retailers in Calcutta and Calcutta Industrial Area by the Distribution Panel.

Fixation of Quotas.—The Distribution Panel will fix quotas on the basis of the above principles between dealers to dealers.

Statistics.—The Distribution Panel will collect and compile all the necessary information and statistics for the above purposes.

Importers and Dealers in Foreign Piecegoods.—As a special case importers and dealers in foreign piecegoods who may not fall under the category of the aforesaid dealers shall be included under the class of wholesale dealers and allotment for them will be fixed by the Board from time to time out of the goods in the hands of the Board as it thinks fit and proper.

Brokers.—In addition to the brokerage being received on the goods being delivered from the mills under the quota system, from the quota-holders by the respective brokers, the brokers will also be entitled to get brokerage at the rate of ⅜ per cent. on the value of all packed bales sold and delivered by the dealers to the commission agents and retailers from the respective commission agents and retailers.

The Scrutiny Panel will scrutinize all current licences issued under the Bengal Cloth and Yarn Control Order and shall remove fictitious and superficial licence-holders. The Scrutiny Panel will also scrutinize the categories of all licence-holders in which the said licence-holder may do his business. Any dealer or person contravening the rules and by-laws of the Board shall be heard for necessary action by the Trial Panel. Any aggrieved dealer or person being dissatisfied with the decision of any panel, will be entitled to appeal to the Appellate Panel. Due publicity will be given to educate the dealers and consumers for making the scheme successful. It will be necessary to levy a cess to finance the administration of the Board and arrangements will have to be made for financing the goods to be received by the Board directly if any.

The Board shall prescribe forms of statements and returns to be filed by the several classes of dealers. The Board will be entitled to frame rules and regulations for the conduct of the Board and of all the several panels. The Board shall also frame rules and regulations for fixing the quotas between the dealers and dealers and/or delivery and payments amongst them.

Post-war Textile Machinery Purchases

Mr. T. Maloney's Suggestion

IN a letter addressed to the Editor of the *Manchester Guardian*, Mr. T. Maloney, M.C., A.M.C.T., formerly Secretary of the Millowners' Association, Bombay, writes :—

" Sir—In India, as in Lancashire, there has been no effective renewal or replacement of machinery in cotton mills during the five years of war, and during the whole of that time mills have all built up large funds from which renewals will be made. Small quantities of spinning and preparation machinery have been sent out to India for 'balancing' purposes and for absolutely essential war needs, but no machinery at all has gone to India for five years for replacement and renewal purposes, and, as Mr. B. B. Joshi recently pointed out, the bulk of the textile plant in India is something like forty years old. British-made textile machinery may be the best in the world, but even the finest machinery must be either obsolete or past its best after forty years of extremely hard wear.

" My definite view is that India will desire to replace the 10,000,000 spindles and 200,000 looms she now possesses within five to ten years after the cessation of hostilities. In addition she will wish to buy very considerable quantities of printing and finishing machinery. Lancashire will also be in the market for enormous quantities of new machinery in the immediate post-war years.

"It can safely be assumed that both India and Lancashire, for a variety of reasons upon which I need not enlarge here, will desire to buy their requirements of machinery in this country.

"I agree with Mr. Joshi and other authorities who have given thought to this problem that the combined requirements of Lancashire, India, and other countries such as the Dutch East Indies and China will very greatly exceed the supplies which British textile machinists will be in a position to manufacture within a reasonable time.

"In the circumstances it seems obvious to me that regulated purchase action (controlled and agreed on jointly by the Lancashire and Indian mill industries through the medium of their representative associations) in consultation with the Board of Trade, the Department of Industries of the Government of India and the cotton textile machinery manufacturers of Great Britain would be the only way of ensuring fair supplies and fair prices for all.

"The initiative for the institution of a system of regulated purchase could and should, in my view, be taken by the Board of Trade without delay. Failing action by the Board of Trade, I would suggest that steps be taken by the textile machinery industry of this country, acting as a unit, to ascertain at once from the Indian and Lancashire mill industries the quantities and types of machinery each will require in the immediate post-war period. Joint and considered action, if taken now, would do much to prevent an undesirable scramble for machinery by individual firms, resulting in unwarranted rises in prices which would detrimentally affect purchasers and suppliers alike and would, in the long run, cause England to lose the pre-eminent position she has occupied as a supplier of cotton textile machinery for so many years in so many markets."

The Manchester Joint Research Council

THE Manchester Joint Research Council held its first meeting in the Council Chamber of the Manchester University, Manchester, England, on 9th October 1944. On assuming office, the Chairman, Mr. A. H. S. Hinchliffee, J.P., made a brief statement.

"We must," he said, "make our existence and our work known in the right quarters. We must make full use of the Manchester Chamber of Commerce organization throughout the country, as well as the brotherhood which links the scientific world. We must establish a close liaison with the Department of Scientific and Industrial Research, and such other bodies as exist to further the objects we have in view. Our aim should be to do what we can to forge a link between the fundamental scientist and the industrial technician, and to stimulate enthusiasm for technical and qualitative advancement without which it is difficult to visualise how any nation with a Western standard of living can maintain its relative position in the world.

"If, as a result of getting to know each other, we can encourage the industrialist to seek out the scientist, and the scientist to come to earth occasionally and visit the factory, if we can cause the good to be less harsh to the clever and the clever less rude to the good, our efforts will be worth while and the totalitarian enthusiasts may find that once again they have miscalculated the potentialities of democracy."

"It is interesting to note that amongst the objectives of the Joint Council there is to be a concentration on ways and means of encouraging activities which will bring science and industry into closer relationship. Research will be equally encouraged and from time to time the Council will discuss questions and initiate special inquiries covering not only industrial and scientific matters, but also economic and sociological problems."

The Mills at Armitage Bridge

By J. W. DICKS (*Exclusive to the Indian Textile Journal*)

IN the industrial West Riding of Yorkshire, England, there yet remain surprisingly quiet and countrified spots which the mill and workshop have occupied but failed to conquer.

Such is Armitage Bridge, a little village lying in a dell some two or three miles south of the large industrial town of Huddersfield.

The mills are those of John Brooke and Sons, Ltd., and the Brookes are probably the most ancient family in the district. A Brooke was feudal lord of Huddersfield when there were fewer than 10 taxpayers on the manorial roll; at Kirklees Priory, nearby, John Brooke, also referred to as John de Huddersfield, was the last Prior before the dissolution of the monasteries by Henry VIII.

In August 1542, the family of Brookes acquired land and a fulling mill in Wooldale. Through 21 generations the business continued, passing direct from father to son to this day.

In about 1810 the building of Armitage Bridge Mills was begun, and the business then really went ahead, employing "upwards of a thousand souls." The site of the mill was chosen for the water-power. There were three water-mills, which generated 200 horse-power. This was tremendous in those days, and at the time the mills were certainly among the largest in Europe. The power was used for fulling the cloth. The first spinning mills at Armitage Bridge were not constructed for power, and housed primitive mules, or jennys as they were called, and these were pushed in and out by the spinner.

There was originally no weaving. This process was introduced about 1840. The yarn was spun, and sent out to the cottages of the hand-weavers on donkey-back, later to be returned as pieces ready for fulling and finishing.

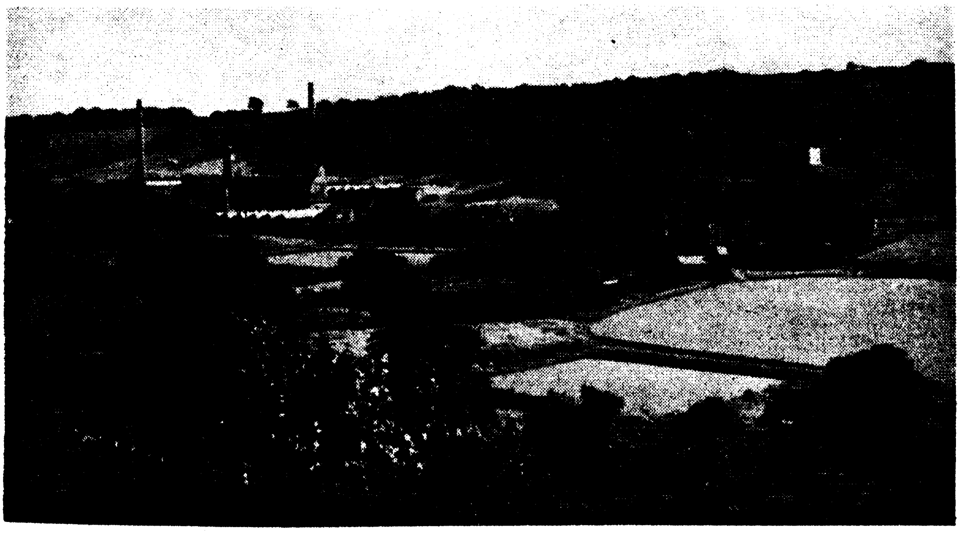
The worst features of the Industrial Revolution passed the Armitage Mills by. Then came World War I. The depression that followed it hit the firm of Brookes badly. The mills ran three days a week only, the buildings fell into disrepair, machinery was not replaced.

In the summer of 1938, Edward Brooke, son of Major Thomas Brooke, one of the two main shareholders, joined the firm, and two months later took over the management. By the autumn of 1938 the mill was on full time, and the spinning mills running night and day for the first time. By the turn of the year the company was making the first steady profits for over a decade.

The company started stocking up in wool, and ordering new machinery of the latest types of Swiss, Belgian and American as well as British manufacture. A progressive standardization of production was set on foot, and the relics of outworn trades and methods discarded. When war broke out in September 1939, the firm was already in top gear, and production since has outstripped all previous records.

New methods have meant introducing new cloths. The old-fashioned blacks and blues, meltons, beavers, doeskins and refines have given place to high quality piece dyes for ladies and children, velours, duvteens, angoras, alpacas, and camel hair. Just now the firm is entirely on Government contracts, but when the war is over it will concentrate with equal determination on winning back the quality export trade.

At Armitage Bridge, thermostat valves control the steam for heating and process, and the mills are fully electrified, power coming mainly from the grid, generated by the efficient Huddersfield Corporation Electricity Department. Over half the looms are driven by individual motor, and old shafting and belting are fast disappearing. In the old stone building where the water wheels once turned, clean white rooms house twin turbo-alternators, which run day and night under automatic control.



Commercial and Technical Organizations

Association of Electrical Undertakings, Central Provinces and Berar

Inaugural Meeting in Bombay.—The first meeting of the newly formed Association of Electrical Undertakings, C.P. and Berar, was held in the Taj Mahal Hotel in Bombay on 6th December 1944, under the presidentship of Mr. K. N. Arnold.

Speaking at a luncheon on the occasion of the inauguration of the Association, Mr. P. E. Patel, its Honorary Secretary, welcomed the councillors of the Association of Electrical Undertakings, Bombay Province. He said that "the idea of forming an association for Central Provinces and Berar had its inspiration from the successful working of the Bombay Association, credit for which goes in a large measure to its President, Mr. Paton, whose cheerful disposition and untiring efforts have brought about cordial relations between the Government and the electric industry.

"Some of us who are gathered here to-day ventured to form this new Association," he continued. "At first the prospects were not bright. Replies from two licensees of old standing were discouraging. However, we were able to secure the active co-operation of one of the best managed concerns in the province and the fruit of our endeavours is this gathering of prominent representatives of the Electrical Industry of the two provinces. With your good wishes and co-operation we will try to achieve the aims of the Association.

"One of the chief aims of the Association is to give to the Government and public bodies facilities for conferring with and ascertaining the views of the industry as regards matters directly or indirectly affecting the industry and to negotiate with them on behalf of the Association and of the industry as a whole on all questions likely to affect the Association. We wish to stand by our aim and offer to co-operate wholeheartedly with Government on all questions of electric supply industry whether local, electric grid or post-war planning, should they decide to take this Association into their confidence."

In conclusion, he expressed the hope that with the co-operation of those concerned the Association would be able to accomplish the task it had undertaken.

The following are the office-bearers of the Association:—President: Mr. K. N. Arnold; Vice-President: Mr. K. S. Guzdar; Honorary Secretary: Mr. P. E. Patel; Treasurer: Mr. C. J. Shah and Members: Messrs. E. M. Cassinath, J. B. Roongta, G. H. Sadarangani, B. K. Bana and E. J. Doongaji.

Association of Electrical Undertakings, Bombay Province

Annual Meeting.—At the fourth ordinary general meeting of the Association held in Bombay on the 22nd November, 1944, Mr. V. F. Noel Paton, President, reviewed the Association's affairs of the preceding year and referred to its growing strength.

Mr. Noel Paton stated that the Government of India as well as the Provincial Government seem disposed to proceed with considerations for electrical development without taking into account the interests who had done so much to develop electricity in the country and were conducting the industry now. He cited the instance of the Policy Committee of the Government of India which met in October, 1943, and which reached certain far-reaching conclusions without hearing the case of the electric supply industry, which was not represented as such on the Committee. He described the Committee as a "packed" one. The Government of Bombay had also been inclined to avoid consultation with the electric supply industry not only in regard to certain regulations which they had issued concerning accounts, but also on various other matters, including the current dispute between the Nadiad Electricity Co., Ltd., and the Nadiad Municipality, and the problem of rationing of bulbs.

Mr. Noel Paton referred to the efforts being made by the Federation of Electricity Undertakings of India to obtain a hearing in further deliberations of the Policy Committee and went on to say that this was a matter of the gravest importance which affected not only those concerned in the administration of supply companies, but many shareholders whose savings were invested in public utility electric supply companies.

He mentioned that somewhat better treatment had been obtained from the office of the Electrical Commissioner with the Government of India in that they seemed to circulate any proposals for comment and consideration before issuing orders.

Central Technical Power Board

He welcomed the formation of the Central Technical Power Board, and felt that something of this sort would be of unquestionable value to India. At the same time its value would be seriously impaired if the personnel of the Board were not *persona grata* with existing interests, and this could hardly be if the Government of India persisted in their present attitude of stifling criticism by the simple process of not giving the critics a hearing.

From this, he said, it should not be assumed that the industry as a whole was not prepared to accept very considerable increases in control. Such control was inevitable, and properly designed and administered could be nothing but advantageous. Those in authority were inclined to forget that the prosperity of the public was the touchstone of electrical development and that the industry's first interest was the increased prosperity of the people.

Amidst these clouds the only silver lining he saw was the speech delivered by Sir Ardeshir Dalal, Member for Planning and Development, Government of India, before the meeting of the Policy Committee for Industries recently held in

Bombay. If the policy adumbrated in this was a clue to Government's intentions, the situation was not without hope.

Future of Control

In keeping with the times it would be wrong not to welcome some form of control in the future, but he was of the opinion that the function of the State in this field should mainly be confined to the encouragement and co-ordination of the development in various provinces and some form of integration of theirs and private resources. In the great development he visualized in the post-war era the value of finance required would be immense and Government could ill afford to scare the investor. The investor must have confidence in the management of the undertakings if he was to continue to put in his money and so had the right to expect a fair return, fair treatment from the controlling authorities and the assurance that rules would not be changed constantly and without just cause.

Talking in the abstract about control and planning in the post-war world, Mr. Paton felt that there was no denial of the fact that beneath the effervescence of enthusiasm to bring about a happy new world by waving the magic wand of planning, it was still to be remembered that the greatest agency for the progress of mankind was the enlightened self-interest of the individual. The force of this contention had been recognized by the International Business Conference which recently met in the U.S.A.

The public had been kept advised of the so-called "Grid" which the Bombay Government were designing, but it might be many years before this attempt to develop the distribution of electricity could be regarded as a "Grid" in the proper sense of the word.

The councillors' report for the year ended 31st August 1944, which was adopted, stated that four firms were admitted to membership of the Association during the year, bringing the total number of members to 38. The following were elected councillors for 1944-45:—

Mr. N. C. Javeri, Mr. J. B. Maneckji, Mr. V. F. Noel Paton, Mr. P. E. Patel, Mr. N. N. Adajania, Mr. E. A. Nadirshah, Mr. K. S. Guzdar, Mr. F. J. Hecht, Mr. A. L. Guilford and Mr. S. J. W. Baldwin.

The Millowners' Association Bombay

Monetary Assistance for Rehabilitating the Cotton Textile Industry at the end of the War.—Following certain discussions which the Committee had with Sir John Sheehy and Mr. C. W. Ayers early in September, a representation was submitted to Government in which the following points were made:—

The expenditure to be incurred in re-converting the industry to the post-war footing should be allowed as an expenditure and adjusted in the last E.P.T. assessment, if such conversion took place within a specified reasonable period after the termination of the war or the removal of the excess profits tax whichever was later.

Mills had to defer until the end of the war certain repairs and renewals, which, though due, could not be undertaken as it would have involved curtailment of production resulting from stoppage of machinery. In this connection, it was suggested that where an industry had set aside a special sum for repairs and renewals, that should be allowed as deduction for the purposes of the E.P.T., even though it had not been utilized, on the understanding that if the amount was not utilized within a reasonable period after the termination of the war, then whatever had not been utilized could be regarded as income in the last year of the E.P.T. and assesssed as such.

The return of the industry from war-time production to peace-time production might involve the scrapping of buildings, plant and machinery which had been provided as part of the war effort. The law already provided relief in respect of any loss incurred, but it was pointed out that relief should not be confined to cases where the equipment was actually scrapped, but should also cover any loss of value in cases where equipment might continue in use.

Mills might hold at the end of the war stocks of various items which were carried at higher cost than would probably be justified by peace-time conditions. Stock figures and valuations were carefully scrutinized by the taxation officer to ensure that they were not unduly written off, and it was pointed out that, if the valuation taken for the purposes of assessment in the last year of the E.P.T. was not realized within a reasonable period thereafter, the assessee should be given an opportunity for reopening the last E.P.T. assessment with a view to set off the losses arising from the drop in valuation.

There would be cases in the last year of the E.P.T. when there might not be sufficient information at the time of the closing of accounts, and the assessee might possibly discover a loss after a year or two following the closure of the accounts. In *bona fide* cases, the assessee should be given an opportunity to reopen the E.P.T. assessment if he proved to the satisfaction of the authorities within a reasonable time after the assessment that when he closed the accounts he did not have sufficient information at his disposal to ascertain the exact loss.

Compensation for Involuntary Unemployment due to shortage of coal, raw materials, etc.—Towards the end of October, the attention of the Committee was drawn to a scheme formulated by the Government of India for the grant of compensation for involuntary unemployment due to shortage of coal, raw materials or changes in lines of production.

No legislative enactment was contemplated; Local Governments were apparently expected to use their powers to persuade employers to pay, sending appropriate cases to adjudication under the Defence of India Rules. The Committee felt that this procedure might perhaps lead to different conditions and rates of compensation in different provinces as there was nothing to prevent the adjudicators or conciliators concerned from proceeding on the assumption that the scales suggested by Government were only the minimum and that they were free to compromise at or award rates which might be substantially higher than those suggested by Government. It was, therefore, suggested that Government might issue an order fixing the rate and conditions of payment which could be statutorily enforced throughout British India and Indian States.

Arbitrators' and Umpires' Panels.—The Association has appointed the following gentlemen to serve on the Arbitrators' and Umpires' Panels for the triennium ending 31st March 1947:—

Arbitrators—*Millowners' Panel.*—Sir Sorab Saklatvala, M.L.A., Messrs. E. M. Solomon, B. S. Dabke, L. F. H. Goodwin, Ramniwas Ramnarain, G. D. Somani, Ramgopal Ganpatrai Ruia, Keshavji Morarji, Krishnaraj M. D. Thackersey, B. G. Davy, H. G. H. Everitt, H. F. Milne, Narandas Munmohandas Ramji, A. Pether and T. V. Baddeley.

Piecegoods Merchants' Panel.—Messrs. Harkisondas Premchand, Laxman Vaman Apte, Devjibhai Damodar, Premji Virji, Gordhandas Goculdas Morarjee, Dahyalal Mathuradas, Ratansi Champsey, Purshottam Mulji Kapadia, Padamsi Damoder Govindjee, Tansukhrai M. Karundia, Harnarayan Gopaldas, Jamnadas Mathradas, Gordhandas Vandravan, Mansuklal Premji and Maganlal Chakubhai.

Umpires.—Sir Sorab Saklatvala, M.L.A. Messrs. Krishnaraj M. D. Thackersey, Purshottam Mulji Kapadia, Ramniwas Ramnarain, Premji Virji, T. V. Baddeley, A. Pether, Devjibhai Damodar, Gordhandas Goculdas Morarjee and H. G. H. Everitt.

Representative on the Senate of the University of Bombay.—By virtue of the recent donation given by the Association to the Department of Chemical Technology of the University of Bombay, the Association would be entitled to nominate a Fellow on the Senate of the University of Bombay for a period of twenty years from the date of acceptance of the donation by the University in addition to the right which the Association already enjoyed in the matter of electing a representative under Section 13A(4) of the University Act.

Accordingly, the Registrar, Bombay University, requested the Association to nominate an additional representative to serve on the Senate, and the Committee appointed Mr. Neville N. Wadia as the Association's additional representative.

Cotton Textiles Fund Ordinance.—By an amendment to the Ordinance, the Collector of Customs was given power to exempt goods which, in his opinion, were exported for a purpose connected with the prosecution of the war. The Association suggested that the grant of such wide discretionary power to the customs authorities might be cancelled and that the duty might be levied on all goods exported, irrespective of the purpose for which they were exported.

Industrial Disputes Act, 1938, *Amendment.*—By certain amendments proposed, Government seek to empower the Government Labour Welfare Officer.

(*a*) to convene a meeting of the employees within the mill premises and

(*b*) to require the employer to affix a notice of the meetings at such conspicuous places in the premises as he might order and to further require that the notice shall be so worded and contain such particulars as the Labour Officer may direct.

In view of the fact that in working of the Bombay Industrial Disputes Act, 1938, the Government have received the unstinted cooperation of the millowners, the Association fails to see the need for such amendments and has, therefore, taken up the matter with Government.

Karachi Chamber of Commerce, Karachi

Textiles ex s.s. "Englistan."—Towards the end of August the Chamber's attention was drawn to the fact that the Government of Sind had not, even by that date, released from the Freezing Orders a quantity of cotton piecegoods imported by merchants from Bombay ex s.s. "Englistan," which arrived on the 11th June, 1944.

In addressing the Controller of Civil Supplies, Government of Sind, on the subject, the Chamber submitted its strongest protest against the inordinate and apparently unnecessary delay. Likewise the Chamber made a reference to the manner in which requisitioning from fresh arrivals had been carried out. It was found that this largely had meant that more easily saleable lines had found their way to the Government controlled shops, leaving on merchants' hands those lines of which stocks were more ample or were slower sellers. The Chamber considered that this action "unbalanced" merchants' trade and was most undesirable.

The Assistant Director of Civil Supplies explained at length the technical difficulties which caused the delays complained of. He further observed that Government had not frozen any of the goods that arrived in Karachi after the first week of June (besides the "English" goods of early June). With regard to the freezing orders of foreign imports entering Karachi after the 1st July, 1944, he drew the Chamber's attention to the Textile Commissioner's letter of the 27th May, 1944, which required that all foreign imports should be price-marked. In order to ensure that price-stamping was done it was necessary to issue a freezing order.

Sind Cotton Statistics Bill, 1944.—Referring to the Bill to facilitate the collection of statistics of stocks of Indian raw cotton in the province of Sind, the Committee offered their observations thereon to the Chamber's representative on the Sind Legislative Assembly, requesting him to emphasize these views when the Bill was brought up for discussion in the Assembly.

The Committee's views were as follows:—(1) It was not agreed there was any real necessity for the legislation. (2) The full penalties of Rs. 500 and Rs. 200 prescribed in section 7(c) would probably never be imposed, but without an adequate penalty clause the Act would remain a dead letter. The Chamber was therefore in favour of the penalties remaining as prescribed in clause 7(*c*). (3) The Chamber would favour an extension of the period allowed for submitting returns [clause 3(3)] from seven to fifteen days.

Transport of Raw Materials for Industries.—Towards the middle of August the Under Secretary to the Government of India in the Department of Industries and Civil Supplies drew the attention of the Chamber to the fact that several cases had come to the notice of Government whereby, taking advantage of the high standing priority of transport in respect of raw materials enjoyed by certain important industrial concerns, goods really not intended for such concerns had been consigned in their names with the obvious motive of obtaining transport. The Chamber was requested to inform such of its members as enjoyed high priority for their raw materials that they should not assist such irregularities by wrongfully endorsing railway receipts or by acquiescing in any action which, apart from constituting a misuse of a privilege, was bound to delay the movement of essential materials to themselves.

The members were duly apprised of the situation.

Marwari Chamber of Commerce, Calcutta

Complaints Regarding Abuses in Permit System.—Several anomalies and lacunas that obtain in the issue of permits against requisitioned piecegoods have been pointed out by the Committee of the Marwari Chamber of Commerce in the course of a communication addressed to the Provincial Textile Controller, Bengal. The Committee complain that permits are being issued without any principle and even blank permits are being issued ; besides inspectors of the Textile Controller's office often accompany the permit holders and make alterations in the permits. It has been further complained that instructions given to the district authorities often make it impossible to select *bona fide* agents and many agents having no ready money find it difficult to take prompt delivery of the goods. The Committee also regret that permits have been issued to persons holding no licence and in some cases to dealers having no sales tax licences and yet in other cases to persons for their individual use. The Committee have also pointed out that the direction given in the Press note that permits would lapse if not presented within five days from the date of issue is not being incorporated in the permits. The Committee have therefore urged a thorough inquiry into the state of affairs with a view to effective control and equitable distribution.

Bangalore Piecegoods Merchants' Association, Bangalore

Sixth Annual Meeting.—The following are extracts from the speech delivered by Mr. Ramnarayan Chellaram, B.A., President of the Association, at the sixth annual general meeting held at Bangalore, on the 14th November 1944:—

Cotton Cloth and Yarn Control Order

"It cannot be claimed that black markets in cotton cloth and yarn have completely disappeared from all markets. In the main manufacturing centres one has still to pay more or less fancy prices, especially for the finer varieties of both cloth and yarn. With all this there is no doubt that a large variety of goods are being sold within the prices and margins of profit fixed by the Government, both in the manufacturing as well as in the consuming centres.

"There are certain aspects of the present scheme of distribution which call for an unbiased examination. Certain areas have been allotted as many as eighteen yards per head per annum and others as few as ten yards per head. Neither the public nor the trade have been taken into confidence as to the data on which this arbitrary allotment of quotas per head of population in each area has been fixed. In the absence of such information the scheme is bound to produce, as indeed it has done, considerable amount of concern and discontent no less among the consumers than among the traders in the areas adversely affected. Another very glaring defect of the scheme is that it completely ignores and fails to protect, excepting in the case of Delhi to some extent, the existence of distributing centres which have been established for decades and centuries following natural and convenient trends of trade. The effect of the scheme will be to ruin certain very big markets in the country which have built up their trade after years of labour and perseverance and after investment of huge sums of money in the trade, besides putting countless traders and their employees in those markets to a considerable amount of hardship and loss of employment. It will also very seriously affect the consumers in places whose traders are obliged to give up their normal sources of supply and seek fresh sources wherefrom it will be more difficult for them to procure supplies, due among other reasons to distances, unfamiliarity and lack of purchases during the basic years. This is a very serious problem and as supplies become shorter in the affected established markets with the lapse of time, the problem will become more and more acute, resulting, one need not be surprised at it, in extensive black marketing in the areas concerned. It is bound to take a pretty long time for the trade to adjust itself to the consequences of the new scheme and the consumers and the smaller traders in many areas must look for a considerable amount of suffering and hardship, not to speak of the entire loss of trade in the case of many others.

Difficulties of Transport

"Transport continues to be a formidable problem. We have been assured, from time to time, that the Government of India are making all efforts to release an adequate number of wagons for carriage of consumer goods to the interior. But, as you all know, bales of piecegoods have often-times been held up for weeks and weeks together at the manufacturing stations accentuating the shortage in the consuming centres.

Defects in the Quota System

"There have been instances on record where dealers have received as their quota from particular mills quantities which have no relation to the meagre purchases they made from those mills in the basic years. Smaller merchants throughout the country whose direct trade in the aggregate with the mills did not form an inconsiderable portion of the respective mills' trade have been denied the privilege of directly purchasing from those mills. The cases of indentors of mills which are more or less on war work which has deprived them of their normal supplies, have not received at the hands of the authorities the consideration which they merited. The dealers who were purchasing goods in the basic years from mills whose production has now been taken over by the Textile Commissioner have been deprived of their legitimate right of purchasing those mill goods. Legal rights of some parties to their legitimate quotas from mills do not appear to have been properly respected.

Difficulties of Border Towns

"With the introduction of quota system both from the mills to the dealers and from the Textile Commissioner to the provinces and States and the new scheme of distribution of cloth we are tending to be more and more parochial. The result is that in not a few cases, places in one geographical unit, due to their proximity to a distributing market located in another geographical unit, are suffering. The merchants of these places are unable to obtain their requirements from their normal suppliers and the merchants in their own districts refuse to sell them any goods because they were not buying from them during the basic years, and in some cases even when they manage to get some supplies from them they find it difficult, due to their situation, to carry their purchases to their places excepting at prohibitive costs. Such cases deserve a more sympathetic consideration than unfortunately they have received so far from the authorities concerned.

Margins of Profit

"Experience has clearly demonstrated the utter inadequacy of the margin of 20 per cent. allowed to the entire distributing agency throughout the country including the cost of carriage of goods from the manufacturing to the distributing and from the distributing to the consuming centres. This inadequacy has become more pronounced on account of the progressively reduced prices of cloth. It has been estimated that it costs a wholesaler in a reasonably far place from the main distributing centres like Bombay about 4½ per cent. to get his goods, and this does not include expenses of his travel to and from Bombay and his stay there. Nor does it include the expenses which a dealer is sometimes obliged to incur and which are such as he cannot write in any books of account. After paying 4 per cent. to the quota holder and 4½ per cent. for his commission agents, brokers, godown rent, war risk insurance, cartage, interest and transport charges, etc., it leaves him a margin of 1½ per cent. out of which, before counting anything as his profit, he must bear the expenses in his home town such as cartage, godown rent, insurance charges, staff expenditure, etc. It has therefore been urged on the authorities that they should increase the margin of profit at least by 2½ per cent. to be distributed over the entire field of distribution excepting its retail end. It has also been urged that the first quota holders' margin should be reduced from 4 per cent. to 2½ per cent. It is very much to be hoped that the authorities will see their way to accept the reasonableness of this demand and increase the margin of profit from 20 to 22½ per cent.

"It is necessary for the Government of Mysore to consider the desirability of increasing the staff in the office of the Additional Textile Commissioner who is also the Controller of Civil Supplies in the State, having to deal with a number of controlled articles."

Reconversion of American Automobile Industry

A REALISTIC examination of the circumstances and figures of American production indicates that the end of the war with Germany will release a substantial portion of the demand on American industry for war production, Alfred P. Sloan, Junior, Chairman of General Motors Corporation, stated in recent addresses before the G. M. Clubs of Los Angeles and San Francisco.

"We now have reached the time," Mr. Sloan said, "when we undoubtedly have both an army and navy remarkably well equipped, not only from the standpoint of quantity but also of technical superiority. The time must come when some radical changes will take place in the demands on American industry for war production. My own belief is that when the war with Germany closes we have to move very rapidly towards reconversion."

"General Motors will start production with models of conventional design because it would be unconscionable for us to take the position that we could redesign our cars and keep hundreds of thousands of people out of employment, and keep our dealers waiting for cars. What we propose to do is to make such changes as are practical within the area of time that is permissible, keeping in mind also the importance of getting back into production and maintaining employment."

In speaking about General Motors' first real post-war car, Mr. Sloan said that its production would take about two years "after we get a complete release of all our facilities, after our engineers and technicians are released to us, after our Proving Ground and all the other things are turned back to us that are now being used by the Government."

"The real post-war car," Mr. Sloan said, "will not be radical or dramatic, but will be lighter in weight, more economical with a smaller motor to use higher octane gasolines and much more attractive both in exterior and interior appearance. The reduction of weight will come through more intensive use of material, and that is not a war development, particularly. We knew pre-war that it was possible for us to reduce the weight of the car through engineering developments that were then available to us, but the war intervened and of course it was impossible for us to capitalize on that improved engineering concept at that time."

Mr. Sloan explained that through the lessened weight and higher octane gasoline in higher compression motors, he believed that the overall increase in economy would be 20 to 25 per cent.

TRADE LETTERS

(From Our Special Correspondents)

Ahmedabad

CLOTH merchants are feeling apprehensive at the note of warning sounded by Sir Akbar Hydari of wiping them out of existence if black markets still persisted in spite of all the measures adopted by Government after two months. About 700 retail merchants have already lost their trade by the quota system adopted by Government and followed in their footsteps by the wholesale merchants. Black markets, according to Sir Hydari, have been virtually stopped by mills, but are continued by merchants who are evidently wholesalers getting quota direct from the mills. Government have fixed quotas for each province and arranged railway facilities accordingly. There is now no reason why cloth should not be distributed all over the country at controlled rates. Still if black markets in cloth are created, it is the policy of Government, declared by Sir Hydari, to undertake the distribution of cloth.

It is not known what machinery Government will devise for this purpose, but it is clear that after the working of cloth control for one year and a half Government is in a position to displace the entire existing trade channel which Government has tried hitherto to retain as far as possible. Government has permitted mills to sell 10 per cent. of their production in their own shops at the full margin of 20 per cent. reserved for merchants. Government will watch this experiment for two months and extend it if circumstances require it. Government is also trying the experiment of running approved cloth shops through selected merchants and some co-operative societies. This experiment which was initiated in Bombay, has been started in Ahmedabad. These two experiments will enable Government to take the next step after two months in the direction of checking the black markets.

The handling by Government of the food and cloth problems is revolutionizing our old economy. The rationing of foodgrains and cloth control are creating a new economy in the country which will have far-reaching effects on post-war economy. A new distribution machinery is coming into existence which will not stop with the distribution of foodgrains and cloth but will cover the entire field of consumer goods. Production, which has been stepped up to the highest pitch by war conditions, requires a new distribution machinery suited to these new conditions. It is gradually taking shape and will evolve into a mighty structure which will help the post-war industrial growth of the country if properly planned and devised. The post-war planning of industries by Government will be linked with the new distribution machinery.

Yarn Distribution

Along with the distribution of cloth, distribution of yarn is being undertaken by Government at controlled rates direct to the consumers without any middlemen. Consumers, who are mostly hand and power-loom weavers, are asked to submit their requirements which will be met from the stocks frozen from certain mills and merchants. Distribution of yarn will accelerate the production of cloth to some extent. If hand spinning is stimulated along with the distribution of yarn there will be an abundant supply of cloth in the country. Mahatma Gandhi has taken to constructive work which includes hand spinning and it is hoped that hand-spun yarn will be available in sufficient quantities to meet the requirements of the handloom weavers. India has a golden opportunity during the continuance of the war and for some time after to stabilize her industries including the great cloth manufacturing industry.

Textile Labour Association

The Textile Labour Association is marching ahead with its new programme for the social betterment of workers. It has started the training of the second batch of volunteers who will work in labour areas as social workers. The Co-operative Labour Bank has been registered and will start working shortly to draw the savings of workers which are being frittered away. 1,40,000 workers of Ahmedabad, who get the highest dearness allowance in the country, wield tremendous purchasing power over the rest of the population of the city which keeps up our cost of living index to a high level although it is declining in other cities where rationing and other controls are working. The only way to lower our cost of living index is to reduce the dearness allowance of workers or to canalise part of it in savings. The Textile Labour Association prepared a scheme of compulsory savings for workers which was not acceptable to the Millowners' Association. The Labour Association has thereupon prepared the scheme of a co-operative bank which, if made popular among workers, will put a salutary check on their purchasing power to the great relief of the rest of the population whose income has not increased in proportion to the increased cost of living.

Calcutta

Jute Workers' Demands for Wages

TWENTY-THREE unions of the jute workers, representing 40,000 members of the entire jute trade, have jointly submitted a representation to the Government of Bengal demanding immediate institution of an adjudicator under rule 81A of the Defence of India Rules to consider the vital demands of the jute workers concerning their wages, dearness allowance, service rules and similar matters. The principal points in the representation are demands for Rs. 2 as dearness allowance, Rs. 40 as minimum wage, security of service and bonus. In support of the representation the Bengal Trade Union Congress have decided to launch a campaign to mobilize resources all over the country.

Release of Frozen Cloth

In a communication to the Textile Commissioner the Committees of the Bengal National, Indian and Marwari Chambers of Commerce and the Marwari Association have requested him to direct the Provincial Controller to restore forthwith the surrendered and requisitioned cloth numbering more than 15,000 bales which have been frozen under the Emergency Cloth Distribution Scheme since the middle of September last. The Chambers have suggested that the requisitioned goods should be returned to the owners with instructions to distribute the same amongst their customers in the trade. They have also opposed the proposal of the Government of Bengal to control the entire distribution in future as they apprehend that it will dislocate normal trade channels. They have further emphasized that the principle of distribution should be laid down by the Textile Commissioner and not by the Provincial Governments.

Yarn Distribution to Weavers

The decision to place immediately about 2,000 bales of yarn at the disposal of the Director of Industries, Bengal, for distribution amongst the distressed weavers in the mofussil was taken at a conference of the representatives of the Bengal Government, the Provincial Textile Control Advisory Committee and of weavers. The Government would provide funds for the purchase of this stock. This yarn will be distributed generally at nominal prices and in certain cases free of costs.

Rationing of Yarn

The suggestion of a census of weavers of Bengal and rationing of yarn on that basis was hinted by the Minister in charge of Civil Supplies at a conference of yarn merchants, quota-holders and other interests involved and sub-divisional officers of all important weaving centres. The Minister explained the various difficulties that confronted the Government in regard to the acquisition and distribution of yarn. He said that 14,000 bales of yarn were required for Bengal normally and Madras had consented to supply 10,000 bales and Bombay 2,000 bales. Out of this allotment 1,500 bales would have to be supplied to Assam. Thus Bengal was facing a deficit of 3,500 bales. The Minister said that in view of the deficit in supply a census of the weavers would be necessary for estimating the total requirements of the weavers and yarn that would, therefore, have to be rationed.

Regulation of Deliveries and Sales of Cloth and Yarn

The Provincial Textile Controller has directed that all dealers in mill-made cloth in Bengal shall, with immediate effect, regulate their sales and deliveries of mill-made cloth and yarn to those dealers who were on the books on the years 1940, 1941 and 1942. The implication of this order is that quota-holders, importers and semi-wholesalers shall distribute their cloth and yarn to their customers in the same proportion as they purchased in the basic years. The above illustrates the broad principles of the Scheme of Distribution which is to be put into effect immediately by the cloth and yarn merchants under the directions of the Provincial Textile Controller. Detailed instructions have been circulated to the district authorities, different chambers of commerce and associations and all merchants have been directed to follow these instructions. Meanwhile cloth and yarn merchants must dispose of their existing stocks which have not been frozen or requisitioned only to those merchants to whom they sold in the basic years. The Provincial Textile Controller has further directed that all bills of lading should continue to be presented to the Provincial Textile Controller as now for endorsement. Each railway receipt or bill of lading should be accompanied by two separate statements giving particulars of invoices, that is, coarse and fine goods in the case of cloth and coarse and fine counts in the case of yarn. Finer goods will continue to be frozen and distributed through approved shops.

Bengal Not to Export Cloth to Assam

Dealers in cloth in Bengal have been reminded by the Government that they are not permitted to sell cloth outside Bengal without explicit instructions of the Provincial Textile Controller. Assam is now excluded from the Bengal zone and receives her quota direct from the Textile Commissioner. No despatch of any type of cloth with the exception of standard cloth is now permissible for export to Assam.

Government's Scheme of Cloth Supply to Retailers

It has been decided that, as far as possible, distribution to retail shops in Calcutta shall be made through the associations of retail dealers who have been advised to become members of one or the other associations, as early as possible, or organize themselves into associations. No association will be recognized by the Government unless its membership is 100 and it is prepared to give an undertaking to the Government in regard to the method of distribution of cloth. Each association will have to submit a return showing the full name and address of each of its members and also licence number, sales tax number and date of first registration, with signatures of the members certifying that they are attached to one of the associations and will accept the rules of distribution framed by the associations and approved by the Provincial Textile Controller. They must also accept the cloth allocated to them and the conditions under which allocations are made. No retail dealer shall be a member of more than one association for the purpose of distribution of cloth and if he signs the form of declaration of more than one organization he will hold himself liable to have his licence cancelled. Each association shall divide its members into two classes, that is, those dealers who were in trade in the years 1940-41-42 and the dealers who commenced their business after 31st December, 1942. Due to the existence of several retail dealers' associations all *bona fide* retail dealers' associations shall be recognized if they conform to the above rule. This scheme, declared the Provincial Textile Controller, is being adopted pending the framing of a final distribution scheme by the Bengal Government.

Government Scheme Criticized

The Committee of the Bengal Textile Quota Holders' Association have protested against the proposal of the Government to select some agents and retail shops for distribution of the fine varieties of cloth. They have observed that in view of the scheme being based on the principle of quota any distinction between the fine, medium and coarse cloth seems to be superfluous. The Committee see no justification for making any distinction among the various varieties of cloth all of which, according to them, should, as usual, be distributed through the existing trade channels as heretofore as the exclusion of fine goods is bound to ignore the rights of some and give undue preference to others.

Minister Explains Emergency Measures

In explaining the several emergency measures the Minister in charge of Civil Supplies said that the appeal of the Provincial Textile Controller produced 7,000 bales of cloth, a proportion of which was readily saleable and acceptable to the trade. Orders were passed forbidding deliveries of textile goods imported from outside Bengal without the authority of the Provincial Textile Controller and all consignments above five bales had been frozen and placed at the disposal of the Government. A consignment of 4,000 bales of cloth arriving by special train had also been frozen. The Minister added that a hundred well-known retailers were first selected, to each of whom five assorted bales were distributed. Four retail dealers' associations were each being given 200 assorted bales for distribution amongst their members. The *bona fides* of the retailers were to be carefully scrutinized because it had come to the notice of the Government that a number of quota-holders and wholesalers have opened up several retail shops in different names with the result that the older retailers had been deprived of supplies while the wholesalers reap the benefit of the entire trade margin of 20 per cent. Cloth was also being sent to the mofussil through traders recommended by the local authorities at the rate of 50 bales for each sub-division as a first step. The Minister informed them that much larger quantities were reserved for the mofussil which would be allotted as and when *bona fide* dealers from the mofussil were recommended by the District Magistrates and Sub-divisional Officers. These emergency measures had to be adopted as cloth was now being sent to Bengal in considerable quantities and Government must make sure that it did not run underground or was held up by the wholesalers.

Disposal of Requisitioned Textile Goods

The dealers who voluntarily surrendered a portion of their stocks to the Provincial Textile authorities have been permitted to sell all the other goods which have not been frozen or requisitioned in bale lots or in open bales. In addition, the following goods have also been released for sale: (i) all loose goods surrendered to the Provincial Textile Controller, (ii) blankets, (iii) cotton raised cloth known as malidas and flannelettes, (iv) hosiery goods, (v) handloom cloth, (vi) hand printed and hand dyed cloth, (vii) all varieties of artificial silk-fabrics with the exception of such fabrics as contain less than 50 per cent. artificial silk yarns. Those cloth merchants who did not voluntarily surrender any of their stocks have been warned that they are not covered by the above concession and that such dealers are to disclose full particulars of their stocks to the Provincial Textile authorities immediately, if not already done.

Cloth Problem of Bengal

Bengal was being allotted cloth on the basis of 10 yards per head per annum while the Punjab, Delhi and Bombay were being allotted 18 yards per head annually in spite of the fact that she was in the war zone, having more war industries and with more military personnel and contributing more to the war effort than any other province. This fact was revealed by the Minister in charge of Civil Supplies while addressing a meeting of the Provincial Textile Advisory Committee in which he emphasized that all his efforts to convince the Textile Commissioner for sympathetic consideration for Bengal failed and her quota was reduced to 10 yards. He further stated that the original allotment of 12 yards per head for the whole of India had been calculated on the assumption that every bale contained 1,500 yards whereas the average bale actually was made of 1,150 yards. The Minister said he would make a strong representation to the authorities in the matter. Condemning the unsocial activities of a section of the textile trade, particularly the wholesalers, he declared that that Government had no alternative but to select such parties for distribution of finer cloth over whom they would be able to exercise control. He announced Government's decision to control the sale through 150 shops to be selected by a tribunal set up for this purpose. He warned the textile trade that if black-marketing and profiteering continued Government would have no other alternative but to take control of stocks and distribute them through Government organizations. Referring to the request of the trade to allow normal trade channels to function, the Minister pointed out that normal trade channels had already been disturbed under the orders of the Central Government by the introduction of the quota system and for all practical purposes it was not possible for any Government to allow under the prevailing times and situation normal trade channels to function without any interference in Bengal. Keeping all these points in view, the Government had, on the advice of the Distribution Committee, brought into operation a new scheme which made it legally obligatory on all quota-holders and importers to supply goods to those of their dealers who were on their books for the period 1940-41-42 and the dealers, in their turn, would supply to the retailers who were on their books for the same period on the same lines and according to the same principles as had been laid down under the quota system of the Government. To set right the maladjustments which were bound to occur in certain cases where the link between one class of dealers and another could not be properly established and in those cases where certain sub-divisions received more than their quota and others received less than what was due to them a tribunal had been set up. A unanimous resolution passed in the meeting recommended that the Bengal Government must protest strongly against the action of the Central Government in allotting to Bengal 10 yards per head per annum while larger quantities were allotted to other provinces as this policy of discrimination among the provinces was absolutely inequitable in principle and unfair in practice.

Suggestions for Making Yarn Distribution Effective

In a statement on the present scheme of distribution of yarn which has come into operation from the 15th November, the Honorary Secretary to the Calcutta Yarn Merchants' Association has expressed the view that the scheme, based on quota-to-quota basis, seems sound in principle and is the only practical step the Government have so far taken to ensure suitable distribution. But it is apprehended that the scheme would not succeed if the freezing orders in respect of counts 20s and above continue. It is stated that practically 90 per cent. of the goods coming to Bengal are of counts 20s and above and if freezing in respect of these goods continues distribution according to the new scheme would be impracticable. It is suggested that if the quota from dealers to dealers is fixed on the basis of 1940-41-42 business as in the case of mills, black market will automatically cease to exist and, therefore, it has been urged on the Bengal Government that immediate release orders should be issued so that yarn may flow through the normal trade channels according to the proposed distribution scheme.

South India

Mysore's New Hydro-Electric Scheme

NOT for nothing has the State of Mysore been described as "The Model State." Its history in recent years shows an almost unbroken record of achievement in practically all spheres of activity, most notably, perhaps, in that concerned with the economic development of the State's natural resources.

The Jog Falls hydro-electric scheme, as it is called, which has been put in hand by the Mysore Government, will utilize the waters of the Sharavati River for generation of the necessary power. For those who are concerned with geographical accuracy it may here be noted, in parenthesis, that Gersoppa is the real name of the falls. They are situated on the Mysore-Bombay frontier, about 18 miles east of Gersoppa and 35 miles east of Honavar. But they are locally known as the Jog Falls, after the neighbouring village of Jog. They occur, as stated, on the Sharavati River which eventually finds its way through a deep, winding gorge to the Arabian Sea.

As a matter of further interest it may be mentioned that the waterfall, with a breadth above the falls of about 230 feet, hurls itself over a cliff 830 feet high, in four separate cascades, known as the "Horseshoe Fall," the "Roarer," the "Rocket," and "La Dame Blanche." The Gersoppa Falls eclipse every other in India, and have few rivals in the world for height and volume. In the former respect it is noteworthy that their drop is more than four times that of the Niagara Falls.

Owing to the varying flow of the river at different seasons of the year—a factor of great importance in India owing to the extremes of hot, dry weather and monsoon floods—sufficient storage capacity to supplement the dry season flow is a necessary part of the scheme.

A reservoir is, therefore, being constructed, at Hirebhasgar, about 13 miles up-stream from the falls, having a storage capacity sufficient to supply power to the generating plant for the maintenance of an output of 120,000 k.w. The reservoir dam will be provided with sluices to let down the required quantity of water for power purposes, and with gates and syphons to pass flood waters during the monsoon. The water from the reservoir will be recovered from the river by a barrage at Karagal, about 10 miles downstream from the dam.

The generating station is being constructed on the left bank of the river about a mile from the falls, from which the nearest point on the metre-gauge system of the Mysore State Railways is at Talguppa, about nine miles from the works. A road and a road bridge across the river have been built for the transport of materials to the works. The installation so far authorized includes four generating sets of 17,500 b.h.p. each, making a total of 70,000 b.h.p., and the requisite turbines, of the impulse type, are supplied by Messrs. Boving & Co., the water-power engineers. The alternators, as well as outdoor switch-gear and step-up transformers, are supplied by Messrs. The British Thomson-Houston Company.

Thus the Jog station, in the extreme north-west of the State, will be interconnected with the existing stations, namely, Sivasamudram and Shimsha. The Jog Scheme, when completed, will cost over four crores of rupees.

Ceylon Government and Madura Handlooms

The Secretary, the Northern India Handloom Cloth Merchants' Association, Ltd., Madura, has addressed the Government of India in the Commerce Department, on the plight of Madura handloom industry consequent on the recent Ceylon Government's Textile Control Order. He says that it is a matter of common knowledge that Madura handloom fabrics are in great demand in Ceylon, which is, as a matter of fact, the only island of export for Madura at present. Madura weavers are employing highly-skilled workers to weave intricate Jacquard designs by paying very high wages and thereby incurring heavy cost of production of these designs. Owing to war conditions, the cost of patterning of these designs has considerably gone up and the upkeep and repair of these Jacquard loom boxes have also become a very costly affair. Besides these, there is also the question of dyes, as Madura weavers, for the most part, are paying the maximum dyeing charges for dyeing Indanthrene to bleach rare colours for their special qualities. When all these practical things are taken into consideration, it will be found that the basis of costing of these special qualities should be properly revised and sufficiently increased to meet the actual conditions. Should the Ceylon Government rates of prices be enforced the handloom industry of Madura will be practically killed, and several thousands of workers will be thrown out of employment.

Ban on Export of Cloth from Pudukottah

The Pudukottah Durbar have promulgated the Pudukottah Cotton and Yarn Order, banning the sending of cloth or yarn by way of inland parcel post to places outside Pudukottah State. The postal authorities are empowered to open any parcel suspected to contain yarn or cloth and are forbidden to book such parcels. Goods sent in contravention of the above order, are liable to confiscation by the State.

Silk Control in Mysore

The subject of silk control was discussed at some length at the last session of the Mysore Representative Assembly and several members pleaded for the removal of all restrictions on the marketing of cocoons and the production and sale of silk. The system of buying silk at controlled rates and selling it by public auction at higher rates came in for much criticism. The Dewan explained that the Cocoon Control Order and the Silk Control Order were conceived in the best interests of the sericulturists. Government have no idea of making any profit in this business. The Control Orders aimed at ensuring an adequate and regular supply of silk to the filatures which were engaged on important war orders and at giving a reasonable price to the sericulturists. The surplus realized in auction sales was divided between the rearer, the reeler and a fund which has been formed for the development of the industry. In this matter it is important to bear in mind a few simple facts. At present there is shortage of silk but great civilian demand for it. If the controls are removed, the probability is that all the profit resulting from the gap between demand and supply would go to merchants and middlemen but both the producers and consumers would lose. If the Control Orders had affected the sericulturists adversely, the extent under mulberry cultivation would have undoubtedly shrunk. But the fact is that the mulberry cultivation has greatly expanded even after the Control Orders came into force, and it became necessary for Government to restrict further expansion in the interests of food crops. If the present system needs any modification, it is in the direction of protecting filatures against loss, on the one hand, and of controlling the prices of silk fabrics, on the other.

Cawnpore

Technological Institute Convocation

ADDRESSING the joint Convocation of the H. B. Technological Institute and the Imperial Institute of Sugar Technology, His Excellency Sir Maurice Hallett, Governor of U.P., stressed the importance of scientific and industrial research for improving the agricultural and industrial conditions of the country. "In India," he said "we have natural resources which we have not touched, we have abundant man-power, a huge population, a greater part of which depends on the scanty produce of a small and often badly cultivated agricultural holding." "There are flourishing industries in India," continued His Excellency, "and I think it will be admitted here that in an industrial city such as Cawnpore, the war has made many of these industries even more flourishing. We must see that these industries do not slump after the war, that they produce the consumer goods of which we stand so badly in need and that they are so organized as to raise the standard of living for the whole population not merely so as to increase the income of the few at the top and of those who pay a high rate of income-tax but so as to raise the income of all and to make all free from want in every sense." He also stressed the importance of industrial education. "We must have boys trained in science and industry so that they can play their useful role in the industrial regeneration of the country."

Mr. L. C. Jain, I.C.S., Director of Industries, in his address gave a brief review of the work done by the institutions. He claimed that the Harcourt Butler Technological Institute was the only one of its type in India that has succeeded in the manufacture of rubber substitutes from castor oil and mustard oil on a semi-commercial scale. He also revealed how these and other products were being tested commercially by the rubber factories.

Electrical Development

With a view to properly assessing the scope for developing hydro-electric schemes in the Province, the Government appointed an Expert Committee recently under the chairmanship of Mr. H. M. Mathews, Electrical Commissioner with the Government of India. The Government desired to make available electric energy all over the province at a reasonable cost. Sir William Ibbotson, Adviser to the Governor (Supplies), revealed that the Government have under consideration a five-year plan containing six important irrigation and hydro-electric schemes, the total capital cost of which was estimated at Rs. 24.63 crores. A new area of 4,599,800 acres are likely to be brought under canal irrigation. The total generating capacity of the present hydel-grid is 48,000 kw. and the likely peak capacity of the 5-year hydel schemes is estimated to be 296,250 kw. Six main schemes have been chalked out towards the attainment of the above objective. They are (1) a project for a 600-ft. high dam to provide water storage and power on the Nayar, a tributary of the Ganges, near Lansdowne in Garhwal; (2) a project for producing power from the Sarda Canal near Banbassa; (3) proposals for an increase in power production on the existing hydel system; (4) a project for water storage and power production on the Rihand tributary of the Sone River in the south-east of the province; (5) a joint project with the Punjab for water storage and power production on the Tons and Giri tributaries of the Jumna; (6) possibilities of the Betwa and Ken Rivers in the south-west of the province. It was also revealed that the Government had set apart a sum of Rs. 10 lakhs for exploratory work on these schemes and orders for exploratory machinery had been placed.

Total Rationing

Preparations for the inauguration of complete rationing in U.P. are almost complete. 1st February has been selected for its introduction. Town rationing officers of the 14 districts earmarked for rationing were called for a conference by Mr. Marsh Smith, Secretary to Government, Rationing, when all the details were discussed.

Development Board for Cawnpore

The Government of the U.P. have appointed a Committee with Sir Edward Souter as Chairman, Mr. N. B. Banerji, Secretary, Local Self-Government Department, U.P., as Secretary, Mr. H. S. Stephenson, District Magistrate, Cawnpore, Mr. Cassee, Water Works Expert, and Mr. Tunny Cliffe as Sewage and Drainage Expert, as members, for inquiring into the conditions of Cawnpore, and for suggesting such measures as are to be taken " to ensure that within a reasonable time the city of Cawnpore will be a fit and decent spot to live in. In particular the Committee is to advise as to what administrative machinery should be evolved for this purpose. The recently constituted Board is to have jurisdiction over the Improvement Trust, Municipal Board and Cantonment Board, with full powers to extend administrative control over all areas within 10 miles' limit of the municipal boundary.

Oil Technologists' Association

A new all-India institution called the Oil Technologists' Association has been formed in Cawnpore. Delivering the inaugural address to the first Convention, Sir Padampat Singhania, Governing Director of the J. K. Industries, emphasized that oil technology was going to play a predominant part, as it would be required, not only for human beings but for locomotives, aviation and shipping. Oil will indeed become indispensable in the industrial era—the coming age will be, what we can call the " Oil Age." Sir Padampat regretted that Cawnpore, though an important industrial centre in Northern India, should have no university of its own.

Textile Commissioner for U.P.

The cloth merchants of Cawnpore have formed what is called an " Anti-Cloth-Black-Marketing Committee," and this is having a very favourable reaction as is revealed now that black marketing in cloth has almost been reduced to about half. The committee is carrying on its work with great vigour. The cloth market is composed of half a dozen organizations rival to each other, but it is a very happy sign that in the drive against black marketing all other organizations have combined. The Anti-Cloth Black-Marketing Committee consists of about 25 persons with a separate Executive Committee of five. The Committee is peculiarly constituted and has no office-bearers like President, Vice-President, Secretary and others. But they have " sanctions " behind them and it appears that if anybody persisted in black marketing he might have to face a very unpleasant situation.

Mr. M. K. Vellodi, the Textile Commissioner, paid a four-day visit to Cawnpore and acquainted himself with the cloth market position in the province. He said in an interview that he has recommended to the Provincial Government the advisability of appointing a full time Textile Commissioner for the province who will deal exclusively with the cloth and yarn problems and with the various other control orders affecting the textile trade in the province. The office of the Commissioner will also be located in Cawnpore which is the largest manufacturing and distributing centre of textile goods in the U.P. He said that the object of the cloth and yarn control had been realized to a greater extent than was thought possible in the beginning and the ceiling prices of cloth and yarn had further been scaled down and standard cloth was reaching consumers at the controlled rates.

Indian Mill Finance

Working of Textile Companies

Morarjee Goculdas Spinning and Weaving Co., Ltd., Bombay

(Agents: Ganeshnarayan Piramal)

The profit of the company for the year ended 30th June 1944, without providing for the agents' commission and depreciation, amounts to Rs. 87,88,068-14-9. Deducting therefrom the commission due to the Agents on the year's profit of Rs. 8,78,806-14-3 and the amount taken to the depreciation of buildings, machinery and plant, electric lights, dead stock and motor vehicles, as per balance sheet and profit and loss account of Rs. 4,17,698-8-9, there remains the sum of Rs. 74,91,563-7-9 which together with the balance brought forward from last year's account of Rs. 1,73,138-6-6 makes a total of Rs. 76,64,701-14-3. Having paid out of this amount, an *ad interim* dividend at the rate of Rs. 15 per share for the half-year ended 31st December 1943 on 17,243 shares which absorbed Rs. 2,58,645 and provided for taxation for the year ended 30th June 1944 of Rs. 60,00,000, there is an available balance of Rs. 14,06,056-14-3 from which the directors recommend payment of dividend at the rate of Rs. 10 per share for the half-year ended 30th June 1944 and bonus at the rate of Rs. 10 per share on 17,245 shares for the year ended 30th June 1944, which will absorb Rs. 3,44,900; to carry to the reserve fund Rs. 10,00,000 and carry forward the balance to the next year's accounts Rs. 61,156-14-3.

During the year all the debentures of the company for Rs. 25 lakhs have been paid off excepting nine debentures, which the owners have not yet surrendered for payment.

During the year, the directors have sanctioned the purchase of Green's vertical tube economisers to replace the existing economisers, which have run out their life of useful service. The equipment has not yet arrived.

The mill buildings, plant, machinery and tools, electric light installation, sprinklers and stock and stock-in-process have been insured on 30th June 1944 for Rs. 2,14,55,525 against fire, riot and civil commotion and for Rs. 1,90,36,326 under the War Risks (Factories) Insurance and War Risks (Goods) Insurance Ordinance. The mill profits and standing charges have been insured for Rs. 30,00,000.

Sholapoor Spinning & Weaving Co., Ltd., Sholapur

(Agents: Morarka & Co., Bombay)

During the year ended 31st March, 1944, the profit earned by the company amounts to Rs. 68,96,476-8 including the sum of Rs. 4,82,269-4-2, being the balance of profit brought over from the last year's account.

After making provision for depreciation on buildings Rs. 3,22,380; plant and machinery including dyeing, bleaching and sprinklers Rs. 4,60,026; on dead stock Rs. 10,061; and on Sholapur City Electrification Scheme Rs. 32,633; and provision for taxation for 1943-44 Rs. 50,00,000, a balance of Rs. 10,71,376-8 is left from which the directors recommend a dividend for 12 months ended 31st March 1944 at Rs. 400 per whole share and Rs. 200 per half share free of income-tax Rs. 6,40,000, and a dividend at 3 per cent. on the redeemable cumulative first preference shares, Rs. 50 per share paid up (tax-free) Rs. 48,000. leaving the balance to be carried forward Rs. 3,83,376-8-0.

A, B and C Mills and contents including stock, etc., have been insured against fire, riot and civil commotion risks for Rs. 5,07,63,208. Profits and standing charges have been insured against fire, riot and civil commotion risks for Rs. 40,00,000. Insurance has also been taken under the War Risks (Factories) Insurance and War Risks (Goods) Insurance Ordinances for Rs. 2,45,33,000.

Mohini Mills, Ltd., Kushtia

(Agents : Chakravarti, Sons & Co.)

During the year ended 31st December 1943 the company has made a profit of Rs. 63,78,433-13-4 which with the amount of Rs. 23,971-6-4 brought forward from last year's account makes a total of Rs. 64,02,405-3-8. After deducting Rs. 4,27,660-10-2 as depreciation on the buildings and machinery, etc., there remains for appropriation an available balance of Rs. 59,74,744-9-6 which the directors propose to deal as under :—To declare a dividend at the rate of 25 per cent. on the paid-up capital (free of all taxes) Rs. 3,49,996-4 ; provision for excess profits tax, income-tax, super-tax, corporation tax, compulsory deposit, etc., Rs. 55,50,000; to carry forward to next year's account Rs. 74,748-5-6.

During the year under report irregular supply of coal made it necessary for the management to purchase firewood from the market at a very increased price.

The Mill No. 1 remained closed for three months for want of coal while maintaining all the expenses for the staff and operatives during the period.

During the year under report the 2nd issue of Debenture loan amounting to Rs. 8,50,000 has been fully redeemed and the liability to the Managing Agents has been reduced to Rs. 1,50,000.

The mill properties, buildings, machinery, stocks, etc. (Mill No. 1 and Mill No. 2) are now insured against fire and riot to the extent of Rs. 75,30,700 and for Rs. 43,08,024 under the Government of India for War Risk (Factories) Insurance Ordinance and Rs. 51,00,000 under the War Risk (Goods) Insurance Ordinance.

Raghuvanshi Mills, Ltd., Bombay

(Agents: Ravindra Maganlal & Co., Ltd.)

The profit and loss account of the company for the year ended 31st March 1944 shows a net profit of Rs. 28,67,604-7-1 after writing off a sum of Rs. 67,736-6 for depreciation for the current year, to which is added Rs. 47,897-1-2 being the balance from the last year's profit, making a total of Rs. 29,15,501-8-3. The directors recommend the appropriation of the amount as follows :—Reserve for taxation Rs. 15,00,000; reserve for the reconstruction of buildings, machinery and electrical equipments Rs. 12,80,000; reserve for bad and doubtful debts Rs. 10,000; to payment of a dividend of Rs. 12 per share free of income-tax Rs. 1,20,000; balance to be carried forward Rs. 5,501-8-3.

The directors regret to report the serious and disastrous fire that destroyed the main portion of the mill on 18th January 1944. In spite of the strenuous efforts of the Municipal Fire Brigade and others, the fire could not be brought under control till the whole of the spinning department was destroyed. The mill, therefore, worked only for 9 months 17½ days during the year and since the day of the fire, it has completely stopped working.

As the property was insured, claims were made with all the companies for loss due to fire as well as for consequential loss for which also the company has insured. After due survey, the loss due to fire on building, machinery and stock and stock-in-trade was settled.

On 4th July 1944, there was another sudden fire in the power house of the mill at about 5 a.m. when the mill was closed. The power house equipment was seriously damaged.

In order to make efforts to reconstruct the mill, the Managing Agents approached the authorities and with their help the great task of reconstruction is progressing quite satisfactorily

The company's property comprising the existing buildings, machinery, stores and stocks is insured against loss by fire (silent risk) and risks arising out of riots and civil commotion. Adequate insurance also has been provided for, under War Risks (Factories) Insurance and War Risks (Goods) Insurance and also Workmen's Compensation Insurance.

Barsi Spinning and Weaving Mills, Ltd., Barsi

(Agents: Desai Arwade Ltd., Bombay)

The result of the working of the company for the year ended 31st December 1943 shows a net profit of Rs. 4,45,256-6-4 after deducting Rs. 98,000 for depreciation of the mill buildings, machinery and furniture. This, with the addition of the balance of profit of Rs. 2,056-1-4 of the last year as carried forward from the last year's balance sheet brings the total credit balance to Rs. 4,47,312-7-8. Out of this amount the following appropriation has been made :—Provision for taxes Rs. 3,50,000; bonus to the staff Rs. 7,500 and charity Rs. 3,000.

This leaves a balance of Rs. 86,812-7-8, out of which the directors recommend the payment of 19th dividend at 12 per cent., i.e., Rs. 30 per share (free of income-tax). Out of the same Rs. 15 per share have already been paid as interim dividend and that leaves the final dividend to be distributed at Rs. 15 per share. This will absorb Rs. 69,030, and will leave a balance of Rs. 17,782-7-8 to be carried forward to the next year's account.

The mill machinery, buildings, stores and stock-in-trade are insured for Rs. 31,18,250 and for war risk insurance for Rs. 22,45,343, as required by law.

Aurungabad Mills, Ltd., Aurangabad

(Agents: Doraswamy Iyer & Co., Bombay)

The profit and loss account for the year ending 31st December 1943 shows a profit of Rs. 11,74,095-13 which together with Rs. 4,158-9-8 brought forward from the last year's account makes a total of Rs. 11,78,254-6-8. This amount is subject to provision being made for excess profits tax including deposit payable under the Hyderabad Excess Profits Tax Act and the Directors have made a lump sum provision of Rs. 9,50,000 in respect of this liability. Out of the balance left, namely, Rs. 2,28,254-6-8 the directors propose to make the following provisions:—To debenture redemption fund Rs. 35,000; to depreciation fund Rs. 16,000; to declare a dividend at the rate of Rs. 60 and a bonus at the rate of Rs. 65 per share on the old 646 shares of Rs. 1,000 each Rs. 80,750; to declare a dividend at the rate of Rs. 45 and a bonus at the rate of Rs. 48-12 per share on the remaining 554 shares of Rs. 1,000 each issued in April 1943 Rs. 51,937-8 and to carry forward to the next year's account Rs. 44,566-14-8.

A small fire occurred in the mills, on 28th May 1943 which resulted in the complete loss of the gin-house and 16 gins therein. The insurance company paid the claim which amounted to Rs. 10,306-9-0.

The company's properties have been insured against fire inclusive of all riot risks for the total sum of Rs. 38,04,900 and also against loss of profit and standing charges for the sums of Rs. 8,00,000 and Rs. 5,50,000 respectively covering indemnity for 24 months. The usual war risk insurances as per Government regulations have also been effected.

Raja Bahadur Motilal Poona Mills, Ltd., Poona

(Agents: Mukundlal Bansilal & Sons, Bombay)

The result of the working of the company for the year ended 31st December 1943 shows a gross profit of Rs. 21,68,592-1-3 to which is added the last year's balance of Rs. 1,48,890-8-11. Deducting therefrom the amounts allotted for depreciation of Rs. 2,50,000; Managing Agents' commission Rs. 1,91,859; provision for taxation Rs. 14,75,000 and interim dividend Rs. 1,12,840 there remains a sum of Rs. 2,87,783-10-2 which the directors propose to appropriate as under :—Final dividend free of income-tax on 28,210 shares at 3 per cent. Rs. 84,630 leaving a balance of Rs. 2,03,153-10-2 to be carried forward to meet the compulsory deposit under the Finance Act.

On account of heavy fire which broke out at the Mills on 7th May 1943, the working of the mills was affected considerably and about 120 looms were rendered unworkable. Reconstruction of weaving shed and putting the looms in working order could not be done early on account of various war-time restrictions and transport difficulties, etc. But the work has been taken in hand already and it is hoped that the same would be completed at an early date.

Buildings, machinery, stocks and stock-in-process and profits of the company, are fully insured.

NEWS OF THE MONTH

Indian

The Moon Mills Ltd.: Change of Address.—From 27th November 1944 the office of the Moon Mills Ltd. has been shifted to the General Assurance Building, 2nd Floor, Hornby Road, Bombay. Their telephone No. is 28078.

Tamarind Seed and Tapioca Starch for Sale.—Mr. K. A. Davies, B.A., B.L., general merchant and commission agent, Trichur, offers for sale large quantities of tamarind seed, tapioca starch, tapioca sago and tapioca flakes. Those interested in these lines may get into touch with him.

India and U.N.R.R.A.—It is learnt that the Government of India propose to contribute Rs. 6,00,00,000 towards the funds of U.N.R.R.A. It is understood that Sir Azizul Haque, the Commerce Member, discussed the matter recently at a conference of party leaders of the Assembly.

Bombay Working Class Cost of Living Index.—During October 1944 the working class cost of living index number for Bombay, with the average prices for the year ended June 1934, equal to 100, was 239. This was the same as in the preceding month. The index number for food articles advanced by one point to 271.

Industrial Disputes in Bombay Province.—During September 1944, there were 17 industrial disputes in Bombay Province—10 in Bombay, two at Ahmedabad and one each at Surat, Sholapur, Dholka and Chembur and Parle-Andheri, in Bombay Suburban District. The number of workpeople involved in these disputes was 15,990 and 30,367 working days were lost.

Jute Purchasing Panel in Calcutta.—The Government of India have decided to set up at once in Calcutta a Jute Purchasing Panel which will be charged with the duty of buying on behalf of the Central Government raw jute to an extent which will support the jute market, at a figure not below the guaranteed minimum prices notified in the Department of Commerce notification dated 5th April 1944.

Textile Calendar

NOVEMBER

28th, Tuesday :
All-India Manufacturers' Organization, Third Quarterly Meeting of Central Committee.

29th, Wednesday :
Maharashtra Chamber of Commerce, Bombay, Annual General Meeting.

30th, Thursday :
Textile Control Board meets in Bombay.

DECEMBER

8th & 9th, Friday & Saturday :
Indian Chemical Manufacturers' Association, Sixth Annual Meeting, Calcutta.

13th & 14th, Wednesday & Thursday :
Conference of Provincial Textile Controllers in Bombay, Mr. M. K. Vellodi presiding.

14th, Thursday :
Associated Chambers of Commerce Annual Meeting, Calcutta.

15th, Friday :
12th Ordinary General Meeting of the Karachi Cotton Association, Ltd., Karachi.

18th, Monday :
Employers' Federation of India, Annual General Meeting, Bombay.

21st, Thursday :
Textile Association (India) : Lecture by Mr. B. B. Joshi, L.T.M. (Hons.), Additional Controller, Raw Materials and Stores, on "the Report of the U.K. Textile Mission to America and its Implications," the Podar College of Commerce, Bombay.

FEBRUARY 1945

8th, Monday :
Budget Session of Indian Legislative Assembly meets in New Delhi.

27th & 28th :
Second All-India Textile Conference, Bombay.

MARCH

1st & 2nd, Thursday & Friday :
Second All-India Textile Conference, Bombay.

Occupational Institutes for Demobilized Soldiers.—A scheme to set up six occupational institutes in the United Provinces to place demobilized Army personnel and others in independent small-scale occupations and as skilled workers in factories is stated to be an important item in the five-year post-war development plan being examined by the U. P. Government. The plan will involve an expenditure of over Rs. 60 lakhs.

Workers Injured by Collapse of Weaving Shed.—Sixteen labourers of a weaving depot in Kodambakkam, Madras, were injured when a shed in which they were working collapsed at about noon on 29th November. Five of them, all women, have been admitted as inpatients into the Royapettah Hospital while the rest were treated as outpatients. First aid was rendered to the injured by the police and men of an A.R.P. rescue party.

Mill Manager and Labour Officer Assaulted by Workers.—It is reported that Mr. S. J. Bose, Manager of the Jam Mills No. 1, Bombay, and Mr. R. G. Gokhale, Labour Officer, Millowners' Association, Bombay, were seriously assaulted by rowdy millhands on the 12th instant and had to be removed to hospital. It appears that the trouble in the mill arose over a proposal to start night shifts and to effect certain changes in regard to recruitment of workers.

Rs. 50 Lakhs for Industrial Research : Travancore Dewan's Announcement.—Sir C. P. Ramaswami Aiyar, Dewan of Travancore, and Vice-Chancellor, Travancore University, delivering the inaugural address at the first meeting of the Travancore University Research Association in the Victoria Jubilee Town Hall, announced that the Travancore Government were setting apart a sum of Rs. 50 lakhs for purposes of research, which figure would be doubled if necessary.

Bonus for Bombay Mill-workers.—About 220,000 cotton mill-workers in Bombay City will get a bonus equal to one-sixth of their total earnings, exclusive of their dearness allowance, for 1944. The bonus, which will be on the same terms as those for the preceding year, will be paid in two instalments, one payable on 20th January 1945 and the other on 24th March. The payment of bonus will cost the industry an additional expense of about Rs. 125 lakhs, representing two months' bill for wages.

Simplex Mills, Bombay, Declare "Ad-Interim" Dividend.—The Board of Directors of the Simplex Mills Co., Ltd., Bombay, have declared an *ad interim* dividend for the half-year ended 30th September, 1944 at the rate of Rs. 4 per fully paid and consolidated Share of Rs. 50 each (free of income tax). The dividend will be made payable at the Chartered Bank of India, Australia and China, Bombay, on and after Monday, the 15th January, 1945 to those shareholders holding fully paid and consolidated shares of Rs. 50 each.

Lancashire Second-hand Textile Machinery: Purchase by Indian Mills.—It is reported in Manchester that representatives of Indian cotton mill interests are negotiating purchase of second-hand textile machinery in Lancashire. A few weeks ago, nearly 20,000 ring spindles were taken from a mill for shipment to India. The machinery is packed and waiting for Government permit for export. The same representatives are negotiating for ring spindles in a mill closed under the concentration production scheme, but there is some difficulty in arranging the price. These developments are causing some concern among Lancashire traders.

Revised Export Advisory Council.—A resolution of the Government of India published in the *Gazette of India* recently announced the revised composition of the Export Advisory Council which was originally set up by the Department of Commerce in 1940, says a Press Note. Raw cotton and textiles interests will hereafter be represented by members nominated by the Textile Control Board instead of by nominees of the Bombay and Ahmedabad Millowners' Associations and the East India Cotton Association. The number of seats to be filled by direct nomination by the Government of India has been increased to 12 to provide for the representation of interests not otherwise adequately represented on the Council.

Proposal to Form an Indian Institute of Art in Industry.—It is proposed to form next year an Indian Institute of Art in Industry which, it is hoped, will become the show-window of India's most attractive wares, said Mr. Henry Born, General Secretary of the Art in Industry Exhibition speaking on "Art and industry" at a meeting of the Rotary Club of Calcutta. Mr. Born added that the Institute would also have representatives abroad and would issue many publications concerned with world progress in all aspects of applied art, including interior decoration. The Institute would have a staff of experts for giving advanced training to students, and a small group of designers would be available to give advice to industry.

Indian Scientific Office in London.—A permanent Indian scientific office in London, which will cement and maintain the relations established during their present visit to Britain is planned by the party of Indian scientists who were recently in England as that country's guests.

It is understood that the organization may be a nucleus from which will grow a complete organization acting in liaison with India for the purpose of collaboration and mutual assistance in British-Indian trade and scientific problems. The organization, in the first instance, is likely to consist of a director and a small executive staff. It would be one of the duties of the office to co-operate with official and other quarters in England in arrangements for graduate students in scientific, medical and other professions when they go to England for training.

Health Insurance Scheme Being Expedited.—Consideration of the health insurance scheme for industrial workers, prepared by Dr. B. P. Adarkar, is now being expedited by the Government of India. Views of provincial Governments and employers' and employees' associations are being invited, and these will be discussed at a tripartite meeting of the next Standing Labour Committee. Consequent on this discussion, a draft legislation will be prepared and circulated for comments.

The Government of India, it is further learnt, have approached the International Labour Office, asking them to send out an expert on social insurance. The expert is expected to arrive in India after a preliminary examination of Prof. Adarkar's scheme is made, and will stay on to participate in the discussions at the tripartite meeting.

Import of Woollen Goods and Serge From U. K.—Mr. C. C. Desai, Controller-General of Civil Supplies, Government of India, told merchants in Lucknow that fresh supplies of radio sets, fountain pens, stationery, watches and silk goods, the supply of which is inadequate, would arrive soon.

Mr. Desai said that the position regarding woollen cloth, bicycles and photographic goods was rather critical. Owing to shortage of those goods, the Government distributed them to various provinces on the basis of population according to the last census.

The Government had expected to release 25 per cent. of the woollen goods manufactured in India for civilian use but could not do so in the current cold weather. He hoped that a large quantity of Indian woollen goods would be available early next year. A "tremendous" amount of serge would be received in this country from the United Kingdom in 1945.

Raymond Woollen Mills Ltd. Sold.—The Raymond Woollen Mills, Ltd., Thana, one of the few well-equipped units of the Indian woollen industry, has changed hands. Messrs. E. D. Sassoon & Co., Ltd., Bombay who controlled the mill for the past 19 years, have transferred the managing agency to the J. K. Industries of Cawnpore for a sum of about Rs. 70 lakhs. The deal has been completed between Sir Victor Sassoon, Bart., on behalf of E. D. Sassoon & Co., Ltd., and Mr. Kailaspat Singhania, representing the J. K. Group and it takes effect from 1st December 1944.

The mill, which was originally known as the Wadia Woollen Mills, Ltd., was acquired by E. D. Sassoon & Co., Ltd. in 1925 and renovated. It is situated at Thana near Bombay and is equipped with 17,300 woollen spindles (2,880 mule, 10,400 ring and 4,020 doubling), 268 looms and also bleaching, dyeing and finishing plant and is entirely on war orders for defence services since the present war started.

British Interest in Indian Industrialization.—Whatever plan there was for the industrialization of India should be put into operation before the end of the war, declared Sir Miles Thomas, the motor manufacturer, in his second broadcast from London on industrial development. To implement this plan, he suggested the setting up of a joint industrial board consisting of representatives of the Government of India and those running factories at present as well as those who would be running them in peace-time.

In Sir Miles's opinion, the picture of India is most encouraging, possessing plenty of labour, much of it with an inbred mechanical sympathy, a good supply of raw materials, the possibility of developing low-priced hydro-electric power on a widespread scale, and a market big enough to take advantage of the most modern methods.

He suggested that some engineering administrators from Britain or elsewhere go to India to do broad-scale planning and organization.

Textiles in the Central Assembly.—Answering questions in the Central Legislative Assembly at New Delhi on 15th November the Commerce Member, Sir Azizul Haque, said that of the total production of Indian mills the proportion of standard cloth was 14.7 per cent. in 1943-44 and 8 per cent. in 1944-45. Sir Azizul Haque refused to share the apprehensions of Sir Zia-ud-Din Ahmed on the outlook for the handloom weavers.

The Commerce Member revealed that, while the handloom weavers were obtaining yarn at greatly reduced controlled prices, the Government had imposed no control on the price of their products.

Sir Azizul Haque also stated that the output of India's cloth was 6,300 million yards this year and he hoped next year would show an additional output of some 200 million yards. About 1,500 million yards of this constituted handloom cloth, while not more than 900 million yards were produced for the Defence Services.

Mr. T. T. Krishnamachari inquired suavely whether textile smuggling took place in any Indian State. The Commerce Member replied that he was not in a position to answer the question.

Mr. Krishnamachari also felt that with only two representatives among a total of 25 the consumers were under-represented on Textile Control Board.

Development of Electric Supply: Government to Set up Central Board.—The Government of India have decided to constitute a Central Technical Power Board which will act as a central planning organization and will advise the Central, Provincial and State Governments as regards encouraging, planning and pressing forward the widespread development of public electricity supply throughout the country, says a Press Note.

A resolution published in the *Gazette of India Extraordinary* says that " the Board will be a strong technical organization designed to collect ideas, conduct surveys and prepare and outline schemes for electrical development in consultation with Provincial and State Governments."

The basic function of the Board will be to collect material relating to power resources and study and plan schemes for power utilization so as to bring about improvement in the national economy, particularly in those zones where the scope for the development of electricity supply seems to be promising but where no active planning appears to be in hand. Thus, in consultation with the Provincial or State Governments, it will undertake investigations, conduct surveys, prepare " technical schemes " and supply an appreciation of the effect of the scheme on the general economy of the region. The results of the surveys, planning and estimates will form a " project report."

Foreign

World Trade Union Conference.—The World Trade Union Conference will be held from 6th to 16th February 1945. A preparatory committee, comprising representatives of the British, Soviet and American trades unions, met the other day in London.

Setting up Industrial Design Centres in England.—Opening an exhibition of textile designs in Manchester recently arranged by the Cotton Board, Sir Thomas Barlow, Director-General of Civilian Clothing, announced that it was proposed by the Government that a council should be appointed for the purpose of encouraging art in industry. One of the Council's aims would be to improve the design of everyday articles, and the proposals

ALL-INDIA TEXTILE CONFERENCE

SECOND SESSION 1945

Organised by THE TEXTILE ASSOCIATION (India), Bombay

27th & 28th FEBRUARY and 1st & 2nd MARCH 1945
at the V. J. T. Institute Grounds, Matunga, BOMBAY

EXHIBITION: COMMERCIAL and TECHNICAL

CHARGES: For Members of the Reception Committee Rs. 15/- each. For Delegates (Reserved accommodation) Rs. 8/- each ; For Delegates Rs. 3/- each ; Students of Technical Institutions Re. 1/- each ; Lady delegates Rs. 3/-.

Tickets available from the Office of the Textile Association (India), " Ganesh Bhuvan" Suparibaug Road, Parel, Bombay 12.

The Conference is open to all interested in the textile industry and will offer opportunities for delegates from all over India to meet one another and discuss problems affecting everyone.

included the setting up of industrial design centres by different industries. The Board of Education would be encouraged to provide industrial art training with scholarships for students at home and abroad.

An Extension of Price Control of Cotton Piecegoods in Australia.—Maximum wholesale and retail prices for 48 lines of cotton piecegoods, imported from the United Kingdom, have been gazetted in Australia. This is a further instalment of a plan to gazette uniform maximum prices of all piecegoods in common use and is an extension of the range of cotton piecegoods which are now subject to specific maximum prices.

Some hundreds of lines of Indian piecegoods were similarly gazetted last May and were of the same type as utility cotton piecegoods manufactured to official specifications for domestic use in the United Kingdom.

Belgian Cotton Mills Start Production.—It appears that Belgian textile mills will be able to start production for relief purposes fairly soon. Limited quantities of cotton and wool have been allocated to Belgium by U.N.R.R.A., and the Belgian Government believes that in the reasonably near future it may be able to resume commercial imports of textile raw materials on a limited scale. The latest reports from official Belgian sources confirm earlier suggestions that the country's textile mills have not been very badly damaged and that in spite of the forced transfer of workers to Germany, the Belgian textile labour supply position is not unduly serious. The supply of textile raw materials accordingly seems to be the main preliminary to the resumption of production.

Clothing and Textile Advisory Council in Australia.—The Federal Clothing and Textile Advisory Council has been constituted to advise the several Government agencies regarding the importation and distribution of textiles for Australia. The Council was constituted by the Associated Chambers of Commerce and Chambers of Manufacturers in all States. It assists and advises the various Government Departments by having matters of interest to the trade generally channelled through the Council. By this means individual members of the chambers concerned and representatives of the trade generally are able to make a united approach to Government officers.

In practice it has been found that recommendations and complaints can be co-ordinated and extraneous matters eliminated by the Council before they are brought to Governmental notice.

The Council is consulted by the Government agencies for trade opinions as to quality and price of textiles when considered necessary.

Egyptian Cotton Position.—Egypt's cotton season, which opened a couple of months ago, is marked by reluctance on the part of the usual buyers. This is attributed to three major factors. They are (1) the large stock of 9,000,000 *kantars* (approximately 100 pounds per *kantar*) carried over in August; (2) a larger estimated crop of between 4,500,000 and 5,000,000 *kantars* as compared with 3,500,000 last year and (3) closer restrictions than ever on export to consumer countries.

In fact, India remains the only real importer, and, even so, Indian buyers are free to buy on the open market only after the recently created Cotton Co-ordinating Commission has effected its cotton purchases for the United Kingdom as well as part of India's requirements and possibly cotton the United Nations may wish to send into liberated Europe.

As far as is known, the Co-ordinating Commission has been on the market only twice to buy some small quantities of Karnak and Giza varieties at bargain prices.

There is as yet nothing definite on American purchases. The question has been discussed with the U. S. Economic mission at present visiting Egypt, but no decision can be forthcoming until it has submitted its report to the United States Government.

Plan to Restart Spinning Mills Closed in 1941 in England.—The first meeting of the Committee established under the chairmanship of Sir Raymond Streat, Chairman of the Cotton Board in England to consider and report upon the problems of deconcentration in the spinning section of the cotton industry was held recently in the offices of the Cotton Board. In addition to the Chairman all the members of the Committee were present, these being: Messrs. H. S. Butterworth, J. R. Fitton, J. Lindey, A. N. Redford, T. L. Taylor, and G. H. Whitehead. The meeting was devoted to a survey of the various aspects of the problem with which the Committee will have to deal and to deciding upon the general procedure to be followed. Frequent further meetings will be held in the near future, but it is not intended to issue statements for publication until the Committee's final report is ready, when the first step will be to make its recommendations known to the industry. About 180 mills containing 15,000,000 spindles, or one-third of the industry, were stopped in 1941, and it is estimated that about 40,000 operatives will be required to restart these mills.

Moves are taking place behind the scenes for amalgamations of some spinning companies after the war. It is possible that some of the closed mills may form a nucleus of two or three combines though before anything definite is done shareholders of these companies will have to be consulted. There are rumours of one or two leaders of the trade being the prime movers in future combines.

Fifty Years Ago

(From the *Indian Textile Journal*, December 1894)

Shareholders' Association Wanted

"Until shareholders take a more active interest in the management of their investments, they will continue to be victimized by unscrupulous managements. Has it never occurred to them to form a small society for the protection of their interests? A very moderate subscription would enable them to get good advice and to organize their investigations, taking one mill at a time. There is no other body whose business it is to interfere with the disorders in the cotton industry and the mere existence of the Shareholders' Association, apart from its legitimate work, would be a wholesome terror to those who are said to have at present got such a hold upon the cotton trade."

Taking Stock

THE advent of the new year gives us, as usual, an opportunity to take stock of the situation as it affects the raw cotton and cotton textile industries. The supply of Indian cotton during the season 1943-44 has been estimated at 8,325,000 bales, it being made up of 2,875,000 bales carried over from the previous season and 5,450,000 bales of current production. Indian mills absorbed 4,125,000 bales, the usual extras for hand-spinning, etc., accounted for 350,000 bales, and nearly 300,000 bales were exported, leaving a balance of 3,550,000 bales. Of this balance, 275,000 bales are reported to be with the Government of India, about 1,600,000 bales represent mill stocks and 1,675,000 bales stocks lying undistributed with the trade. In the current season, assuming that Government efforts at curtailing cotton production continue to bear fruit and that they result in an acreage reduction of 10—15 per cent. —actually the first forecast estimates reveal a reduction of 24 per cent.—a crop of 4,500,000 bales may be expected, and together with the carry-over the total supply may amount to 8,050,000 bales. In view of the possibilities of increased textile production, Indian mills are expected to consume about 125,000 bales more than in the last season. The launching of a subsidized export programme by the U.S.A. for American cotton is being viewed in the gravest light and Indian exports in the current season may not exceed 600,000 bales. Taking the usual figure of 350,000 bales for extra factory consumption, the distribution of Indian cotton in the current season is placed at about 5,200,000 bales, leaving a carry-over of 2,850,000 bales at the end of the season.

As to cotton manufactures, their production was considerably accelerated last year. Roughly, the total supply available to the internal market before the war was 6,000 million yards. The mills and the handlooms produced nearly 6,800 million yards last year, but exports accounted for nearly 600 million yards and Defence requirements for nearly 900 million yards, both having been absent in the pre-war years. The stoppage of imports and substantial rise in exports and Defence demands have together combined to render even the increased output of 6,800 million yards inadequate to clothe the civilian population. The Commerce Member of the Government of India recently expressed the hope that it might be possible to step up production by another 200 million yards if the coal situation became easier. We have before now drawn our readers' attention to the precarious coal situation. The stoppage of certain mills during the year was avoided only by the switching over by Government of 30,000 tons, held by Bombay mills as a stand-by against any contingency arising out of a breakdown in supplies of fuel oil, for use by mills in and around Bombay; as if to remind us that the trouble is not over we now hear that mills in Ahmedabad, Sholapur, Indore and elsewhere are being closed down for want of coal. Indian mills require about 180,000 tons annually, but they have to carry on with a supply of 150,000 tons. The problem of coal raisings and transport to mill centres has been seriously engaging the attention of the Government of India. They have appointed a Coal Control Board and a Coal Commissioner, but there is a general feeling that the Board has not been meeting often enough and a vague misgiving as to whether all is well with the Coal Commissioner's assignment of priorities. Although more could perhaps be done to attract mining labour to the fields, there would appear to be no immediate remedy for shortage unless Government arrange to import coal from South Africa, as was being done before the war.

Official control of the textile industry has been attended with varying degrees of success in the spheres of production (which we have dealt with already), prices and distribution. Prices have gone down very considerably from the peak levels of 1943 and are to-day less than 250 per cent.

of the pre-control rates, this being held justifiable on account of the increased costs of production. A further reduction of 5 per cent. in the prices of cloth manufactured with warp counts 50s and under and of 6¼ per cent. in the ceiling prices of specified yarns has been announced to take effect from 1st February 1945. Against a background of decreasing margins the cotton mills in India have been puttingforth their best effortsto co-operate with Government, and it has been officially recognized that the cost of production figures submitted by them are by no means exaggerated; we are informed that no mill is making a profit of 20 per cent., as alleged, and that several are making no more than 7½ per cent. If that is so, it is hard to understand the complaint of the dealers that the present margins leave little to the trade and their request that an addition of about 2½ per cent. to the present prices might make cloth business profitable once again and put an end to black markets. But the authorities have turned down this request as being ridiculous in the context of the prevailing rates, which are higher than the control rates, not by 2½ or 5 per cent., but by as much as 50 or 60 per cent.

Distribution, however, has always been the weakest spot in the control scheme. For several months after the introduction of control a certain section of the industry continued to distribute its production through channels created during war-time in order to defeat the operation of the excess profits tax, and the dealers who had to buy through these channels found that business was not possible except on payment of black market prices. The mills were directed, therefore, to sell their products only to dealers who were in the trade in the years 1940-41-42. Following on this, the Government of India took over two of the Bombay mills and controlled, through the medium of a number of approved shops, the distribution of the products turned out by 12 mills in the provinces of Bombay and Madras. Other drastic measures were also taken, including the cancellation of the licences of several offending dealers. But it would appear that the effect of this shock has been wearing off and black market activities have again been prominent. A zonal scheme of distribution on *per capita* basis through dealers authorized by permits to despatch goods from manufacturing to consuming centres and a system of notifying provincial authorities particulars regarding consignments so despatched were evolved as a temporary measure, but black markets continued to flourish. An official warning was therefore given ; if black markets persisted after 31st January 1945 despite everything that Government could do, they would not hesitate to " wipe out " the offending sections of the trade, and make their own arrangements, whether through an extension of the approved shop system, or through co-operative societies, or through other means, for the effective distribution of cotton piecegoods in adequate volume and at reasonable prices. Accordingly, the Cotton Cloth and Yarn (Control) Order, 1943, was recently amended giving the Textile Commissioner very wide powers to direct distribution along specified channels. An order was subsequently issued under these new powers, directing quota-holders in Bombay City and suburbs not to sell or deliver any cloth or yarn purchased directly from a manufacturer or to open any such bale except on the Textile Commissioner's orders. A serious source of leakage into the black market was taken, therefore, to have been blocked, the disposal of available supplies, so far at any rate as Bombay was concerned, no longer being vested in the distributing trade. Dealers, on the other hand, who are unable to deliver cloth or yarn when so directed automatically betray themselves as black market men. Moreover, they cannot non-co-operate with Government by refusing to take delivery from the mills, for, if they do so, their quotas will be cancelled for the future. To crown all, at the latest meeting of the Textile Control Board, its Chairman announced that an entirely new scheme of central distribution of cloth has been agreed upon between the representatives of Government and the industry; providing as it does for central direction and co-ordinated provincial action it is expected to show better results than before. These measures appear to be quite comprehensive, but it is too early yet to make any comment on their effectiveness.

Platt Report and Lancashire Machinery

Reactions to the Report of the Cotton Textile Mission to the U.S.A.

BY T. MALONEY, M.C., A.M.C.T.

(Specially Contributed)

By now quite a number of cotton men in India must have seen and read the White Paper, popularly known as the "Platt Report," setting out the facts ascertained and tentative conclusions reached as a result of the Lancashire Cotton Mission's recent visit to the United States of America. The document has caused more than a little stir in cotton textile circles and the report and correspondence arising from it have had very wide publicity in the British Press. It must by now be almost a "best-seller" and it is in fact a most valuable report, no matter how loudly bodies or individuals may endeavour to explain away portions of it which are unpalatable to them. It has many lessons for Lancashire, but perhaps just as many for India and other important cotton textile producing countries, and the facts it contains will repay careful study by all senior responsible officers in cotton mills.*

The Report has also equally valuable lessons for the leaders of the Trade Union movement, Government officials whose work brings them into close contact with the industry, and the distributors of cotton goods. The following pages contain an analysis of the findings and recommendations of the Report and a vindication of British textile machinery drawn up by Mr. T. Maloney, M.C., A.M.C.T., after a personal visit to the more important of the British textile machinery plants. Having been connected with the cotton mill industry in India for over twenty years in the capacity of Secretary of the Millowners' Association, Bombay, Mr. Maloney writes with a special authority and inside knowledge of the subject.

IF I were asked to give the reason why the Report has caused so much discussion and heat I would say that it was due mainly to a little over-emphasis, but, after all the Lancashire man usually calls a spade a spade and many of the critics of the Report's conclusions apparently overlook the very limited character of the Mission's terms of reference.

Terms of Reference

All that the Mission was asked to do was to investigate and report on the methods used in the cotton industry in the U.S.A. and to advise on any changes in method which could usefully be made in England to increase production without a further call on man-power. At the very opening of the Report it is made clear that costs of production were not taken into consideration and that the Mission confined its investigation to production per man-hour and, in reading it, the foregoing statement should always be borne in mind. It is quite true that in places the members of the Mission appear to have been rather carried away by their enthusiasm; but that is perhaps understandable when one considers the magnitude of some of the differences in man-hour output which they found at the various stages and in certain processes of manufacture. In fairness to the Mission it should perhaps be said that the factors accounting for differences in output standards between the United Kingdom and the United States were touched upon; it was never stated in the Report that a slavish imitation of American methods would be possible or advisable in Lancashire, and it was never said that what has been achieved in the realm of output per man-hour in America could be reached in Lancashire within a reasonable space of time. As with Lancashire, so with India, the essential special characteristics of a country's particular trade, the system of organization of the industry, the type of markets it seeks to supply, the type, volume and remuneration of the labour it has to employ, the selling organization through which operations are conducted, financial resources, prices of various types of machinery, incidence of taxation, feasibility of shift-working, access to markets, attitude of labour to rationalization, and many other almost equally important factors, must all be taken into consideration and will have important influence on the type of machinery to be used and its layout.

---

*Please see the *Indian Textile Journal*, December 1944, page 148.

Most of these influences on the possibility or advisability of a large-scale change over to standardized products and a complete rationalization with the object of increasing output per operative to the highest possible are touched on briefly in the Report itself, but a casual reading of it has in some cases had the effect of unwarranted conclusions being drawn by both mill men and the Press.

Misleading Conclusions Drawn from the Report

The *Daily Mail* of 4th December 1944, referring to a speech by the Rt. Hon'ble Mr. Herbert Morrison, reports him as saying: "The Report of the 'Platt Mission' which examined the American industry and compared it with the British is a dreadful warning. The American industry is fully equipped with the best up-to-date machinery; the British has altered little in 30 or 40 years." The *Manchester Guardian*, in a slightly longer reference to the Home Secretary's speech, quotes him as saying: "We have an evil legacy in the shape of several great basic industries whose organization and outlook go back to an earlier period and are quite inadequate for the needs of the day . . . the Report of the Platt Mission . . . is a dreadful warning . . . . The British industry has altered little in structure during the last 30 or 40 years and in equipment lags a long way behind the American . . . The causes of the difference lie not only in the installation and use of machinery but in the way the industry is split up into separate sections all the way from the spinning to the marketing of cloth." In the first place it is quite wrong to conclude—if Mr. Morrison so intended—that the whole of the blame for the present poor position of the Lancashire industry can be laid wholly at the doors of the employers, and the sectional organization of the industry. Labour, working through its trade unions has generally resisted with great fierceness attempts to introduce innovations and rationalization or has demanded wage concessions which have ruled them out as economic propositions. It has up to now been to a great extent a matter of r.a.p. whether a particular innovation is worth while when the final product has to find a market in competition with that of another country in an overseas market. With due respect to the Home Secretary I maintain that the "Platt Report" never intended to convey that output per man-hour could be brought up to "maximum" levels in England—the optimum levels in England would in any case differ from those in U.S.A.—without an entirely new orientation in the attitude of labour to innovations, standardization, rationalization, shift-working and other important factors which contribute to the economic value and well-being of a large-scale industry. Another impression which has gained some credence in the mind of the man in the street and perhaps in the minds of some mill authorities in India, to judge from a letter I received a few days ago, is that the Report had stressed the superiority of American machinery over British. The Report certainly does point out that, taken as a whole, the average mill in the United States has more modern machinery than a Lancashire mill, and that nearly all mills have high drafting, and use bigger packages, and more automatic machinery, but it would be a grave error to conclude from this that American-made cotton textile machinery is superior to what is available for purchase in England.

To satisfy myself on this point I have recently visited some of the largest textile machinery plants in England and as a result am convinced that, excellent as are the American machines and innovations dealt with in the "Platt Report," equally excellent machines and innovations have been and are being manufactured in England to-day.

In view of the fact that the existing textile machinery in India is very largely of British manufacture and that a change-over to American or other machinery, except after the fullest possible investigation, would be likely to create considerable difficulties, I will deal briefly with some of the American improvements mentioned in the Report and indicate the British equivalents available.

Blowing Room Machinery

The Report refers to the intensive use of blending hopper bale openers followed by large-scale hoppers for blending purposes. There is nothing very new in this practice. Blending hopper bale openers have been manufactured in England for many years and single process is now standard practice with English machinery makers. Where it is not installed it is because the customer prefers the two-process system. The actual sequence of machines making up the unit depends upon the type of cotton treated.

A seven-cleaning point unit would probably be advisable for dirty Indian cottons: a six-cleaning point for better Indian and low American cottons: a five-cleaning point unit for good American cottons: a four-cleaning point unit for Egyptian cottons and a three-cleaning point unit for the best qualities of Egyptian and Sea Island cottons.

Almost every machine in a single process lapping unit has been improved in some way during the last few years and dust extractors and pneumatic arrangements employed to-day are far in advance of anything previously used for the extraction of light dust from cotton.

Twin Combers.—These machines have been made in England for a number of years but it is doubtful whether there is any advantage in the use of the twin comber over the single comber except in the matter of floor space occupied.

Lap Forming.—Machines of exactly the same type as those referred to in the "Platt Report" are manufactured in England to-day and will probably be used more extensively in conjunction with lap drawing frames in British mills in future for the production of standard qualities of yarn.

Lap Drawing Frames.—Machines similar to those used in the U.S.A. are also made by English textile machinery makers in England. The advantages claimed for the controlled lap drawing system are that each lap is identical in weight and length, exactly filling one can of 12-14 lbs. capacity free from pieces and thick and thin places. The regularity of the card slivers is thus preserved and higher efficiency in the drawing process is obtained owing to longer running and freedom from stoppages. Power consumption, labour employed and floor space occupied are also less than with the older systems of drawing.

High Drafting in Card Rooms.—The high draft speed frame has been made in England for a number of years and is recognized as one of the most important developments in spinning technique. The machines made convert finished drawing slivers into rovings for the ring frame in one operation.

High Draft Ring Frames.—High drafting systems on ring frames have been standard practice amongst British textile machinery makers for about twenty years.

Roller or apron drafting systems can be supplied to suit a customer's convenience but I need not describe them in detail, since Indian mills have been purchasing both for many years and I think it would be true to say that the wider use of high drafting ring frames in England is a certainty after the war and that financial stringency is the main reason for the present prevalence of low draft machines in Lancashire.

Universality of Ring Spinning in U.S.A.—Whether Lancashire will continue to produce its finest and special quality yarns on mules in preference to ring frames is somewhat doubtful, but I think it may be assumed that for low and medium counts the ring frame will rapidly displace the mule. It is, at any rate, true to say that the adoption of ring spinning in England has in no way been handicapped by a lack of the best possible type of machines. Roller bearing spindles with tape driving, the latest type of anti-ballooning arrangements, rising and falling lappets, longer lifts, off end-driving machine cut gear wheels and centralized headstock lubrication, will be features of the post-war machines.

Individual Electric Driving.—Overhead shafting, the absence of which was favourably commented upon in the "Platt Report," is certainly still a feature of Lancashire mills, but it must be remembered that the cotton mill industry in Lancashire is located in one of the world's richest coalfields and that this resulted in the highly efficient development of the steam drive. For a long time there was no alternative to this method of driving, but the position to-day is different. Electro-technology can now provide an equally efficient method of driving cotton mill machinery and Lancashire, in common with America and other countries, can appreciate the advantages which individual electric drive gives. Here again the adoption of a particular type of drive is largely a matter of rupees, annas and pies.

Large Packages.—Machinery manufacturers in England can and do make provision for the production of large packages at every machine in a cotton spinning plant.

Referring to an article published in the *Journal* of the Textile Institute in January, 1943, I found that British machinists are fully cognizant of the economies in costs and increase in efficiency which larger packages provide and the factors which have militated against their very general adoption in English mills in the past, and it is stated in that article—" 12" diameter cans are now adopted to a great extent at carding engines, combers and draw frames. Ring diameters, lifts and spindle speeds have increased and modern mills would have the following:—

Counts.			*Ring dia.* Ins.	*Lift.* Ins.	*Speed.*	*Depending on*
Up to 10s	..	..	2½	9	6,000—6,500	Turns per inch
10s—16s	..	..	2¼	9 or 8	7,000—7,500	
16s—24s	..	..	2	8	8,000—9,000	
24s—32s	..	..	1¾	8 or 7	9,000—9,500	Circumstances.
32s—60s	..	..	1⅝	7 or 6	Up to 10,500	
60s—100s	..	..	1½	6 or 5	10,500—8,000	

Weaving and Preparatory Machinery

Barber Colman Spoolers.—These very excellent machines are dependent for their satisfactory use on the availability of large package ring bobbins of the " roving build " type. Unless, therefore, a mill intended to equip its ring spinning department with warp frames which build roving type bobbins, the adoption of Barber Colman Spoolers would seem to be impracticable.

Abbot Winder.—The amount of labour employed on this machine also largely depends on the size of the ring warp package supplied to it. It is an excellent machine and is being manufactured in England by Thos. Holt Limited, Rochdale, under licence.

High Speed Warping.—No comments appear necessary. The English equivalent of the American machine is already in use and popular in a number of Indian mills.

Drawing in and Knotting Machines.—Machines similar to those in use in America would probably be an expensive luxury in England unless and until very much greater standardization is achieved in the weaving section of the industry.

Slasher Control.—The Hibbert Patent Air Sizing and Drying Machine, made in England, definitely gives slasher control and higher production and is comparable with machines made in the United States.

Automatic Looms.—Northrop automatic looms, similar to those in use in the U.S.A., have been made in England for at least forty years by the British Northrop Loom Company.

I have not attempted to deal with every mechanical device and " novelty " mentioned in the Report because space does not permit it, but it would certainly be true to say that Britain can and does supply, when considered advisable, machinery capable of producing the larger " packages " mentioned so frequently in the Report.

What I wish to stress is that it is essential to distinguish between the statement in the Report that American mills as they exist to-day are " *mechanically* " more efficient than Lancashire mills and the unwarranted assumption that American textile machinery is superior to that which can be bought from Britain but which, for financial and other equally pertinent reasons, could not and has not been installed in Lancashire mills generally during the last ten or fifteen years.

Conclusions and Short-term Recommendations of the Report

The recommendations and conclusions set out in the Report are not reproduced in full in this article since they have appeared in a previous issue of the *Indian Textile Journal* and, in my view, it would be advisable to study them in their full context and with the comments the members of the Mission have considered it desirable to make upon them,

but the following observations seem pertinent. The Report indicates—(1) American mills employ very much less labour than Lancashire mills to achieve a specified output. The difference appears to be greatest in weaving preparation departments, next greatest in weaving and least in spinning. Standardization and bulk production has greatly assisted in bringing about this result and this has been facilitated by the integration of spinning, weaving and finishing in the same concerns. The concentration of distribution of finished products in the hands of a few large firms has also been advantageous.

A fillip must also have been given to standardization and the use of high speed and automatic machinery by multiple-shift working, scientific management and the very high remuneration which has to be paid to skilled operatives in America. These factors have tended to make it more economical to mechanize as much as possible in order to give the greatest possible output per worker per hour.

(2) For a given count of yarn it is usual to use cotton superior to those used in Lancashire for the same equivalent count. Twist factors used in spinning are also higher than in Lancashire in order to achieve optimum strength yarns. While these higher twist factors would almost invariably have the effect of reducing machine output per hour in the spinning department, it does not reduce output per worker, since fewer breakages occur and workers can and do tend more spindles than in Lancashire or India. In processes subsequent to spinning and particularly in weaving, the higher twist factor used in American yarns has an entirely beneficial effect on output in the strictly quantitative sense.

(3) Work loads are allocated in a scientific manner, e.g., the spindles given to a worker are largely dictated by the breakages he is called on to repair in a given period. This seems to indicate that the Bedaux and similar systems of Time and Motion Study have been and are being applied with good results.

(4) Larger packages are being used at almost all spinning and cardroom machines than is usual in England. It is of course obvious that within limits larger packages are a potent factor in reducing the frequency of handling and that they reduce the labour required per unit of production, but it should be noted that they are facilitated by bulk and standardized production and that there are limiting factors to their use, e.g., floor space requirements per machine, higher machine costs and possibly lower running speeds.

(5) Ring spinning and high drafting are the almost invariable rules in American mills.

(6) Spinning frames in the U.S.A. are usually interchangeable. This is possible as the direction of twist in warp and weft yarns used in America is the same. It is a practice the advantage of which seems open to question.

(7) High speed spooling at controlled tension has largely superseded other systems of winding. The use of Barber Colman Spoolers, Abbot Winders and similar machines is facilitated with standardized bulk production, which is a feature of American mills.

(8) High speed warping is general in American mills.

(9) Automatic looms of the Draper and Crompton and Knowles type have practically replaced Lancashire type looms.

(10) American mills usually spin, weave and finish in the same plant. This arrangement has facilitated standardization and the use of high speed winding and warping, automatic looms and shift-working. The British system of horizontal organization and the wide range of products spun and woven in individual concerns has limited the development of standardization and the use of automatic machinery.

(11) A particular feature of American practice is the use of large warpers and weavers beams and control devices in slasher sizing.

(12) The scope for introducing new practices in the utilization of labour in American mills has been greater than in England owing to the absence of long-standing practices and conventions and the acceptance by labour of scientific methods in matters of assignment of duties. This point has been dealt with earlier but it is perhaps necessary to stress that in India as in England rapid and peaceful progress in rationalization, using the term in its widest sense, will only be achieved by a reorientation of labour and labour leaders'

attitude to scientifically based innovations in the matter of work allocation.

The Mission found no evidence of operatives being overworked in American mills although the numbers of spindles or machines supervised by an operative were almost invariably greater than in Lancashire and, of course, much greater than in India.

(13) The system of work allocation and the greater use of complicated modern machines and automatic looms has resulted in the use of a greater proportion of supervisory and ancillary workers than in England.

(14) Lighting arrangements and machinery spacing appear to be superior to what is usual in England in existing concerns. Fluorescent lighting is usual and modern buildings have permitted very ample spacing between machines which facilitate the use of runways and reduce the physical effort and amount of labour necessary for moving material from one process to another.

(15) Individual driving and driving from underground shafting are noticeable features in American mills.

Short-term Recommendations

What the Mission term their short-term recommendations follow naturally from their observations. They may be summarized as under—

(1) The greater use of high drafting in card and spinning rooms.

(2) The use of larger cans in card-rooms.

(3) Closer internal working arrangements between spinners and manufacturers.

(4) The use of slasher control systems.

(5) The greater use of automatic draw and knitting machines.

(6) Increases, where practicable, in the number of looms per weaver by the greater use of larger yarn packages, warp stop motions, etc.

(7) Greater use of "ancillary" labour in weaving sheds.

(8) More adequate loom spacing.

(9) Improvements in lighting and the greater use of runways for the internal conveyance of material.

The other short-term recommendations made are not of very great importance, but I was somewhat surprised to find no short-term recommendations concerning the introduction of high speed winding and warping.

Long-term Recommendations

The nature of the long-term recommendations comes rather as an anticlimax to the Report itself but they do serve to show what a small section of the problems before Lancashire was comprehensively covered by the Mission's activities and that the achievement by Lancashire of American p.m.h. figures, even if it is possible or economically advisable either wholly or in part, is going to be a strenuous and perhaps lengthy process and one which will involve the closest possible co-operation between all sections of the trade, between employers' and workers' organizations and will require effective assistance from Government.

(1) A change in the system of distribution which would permit closer co-operation with producers and, as far as practicable, bulk production conditions.

(2) "Modernization" of the Lancashire industry on the basis of securing the highest possible production per man-hour.

(3) Preliminary investigations should be made—

- (*a*) to ascertain by means of a comprehensive survey the suitability of existing plant for modernization;
- (*b*) to determine what measure of improvement is possible in existing equipment;
- (*c*) to ascertain as a result of investigations (*a*) and (*b*) the industry's requirements of new equipment;
- (*d*) to ascertain the extent to which mechanical transporter systems can be used in mills;
- (*e*) to determine the most suitable planning of machinery with particular reference to machine and labour efficiency and such matters as spacing and driving.

The Mission also recommended that new methods of mill staffing should be tried out and that their effects on machine and operations efficiency should be measured and simple wage rating methods should be formulated.

(4) To accomplish the work involved, it was recommended that a small number of selected mills should be made available for the investigations and that a panel of

(*Continued on page* 229)

Platt Report and Indian Cotton Mills
Its Significance to the Industry

The publication of the Platt Report on the relative production per man-hour in England and America has created a great stir in Indian textile technical circles as it did in England. The Textile Association (India), therefore, convened, under the presidentship of Mr. Nandulal Mehta, B.A , LL.B., a couple of meetings at which Mr. B. B. Joshi, L.T.M. (Hons.), Additional Controller, Raw Materials and Stores, Cotton Textiles, Government of India, Bombay, spoke on the progress of spinning, preparatory, weaving and labour management in the U.K. and U.S.A. as revealed by the Platt Delegation. Mr. Joshi stresses the educative value of the Platt Report and brings out clearly the various considerations which militate against the wholesale adoption of American methods and machinery in India. The importance, therefore, of working existing machinery to optimum capacity in order to maintain production at the optimum level cannot be exaggerated. In this view the tips given by Mr. Joshi to Indian millowners and their technical staff about improvements that are immediately practicable and about the placement of orders for new machinery and parts will be widely appreciated. Mr. Joshi also suggests two sub-committees to be appointed by the Textile Association, one to study the conditions of cotton mills which would supply detailed information to the questionnaire to be issued by the sub-committee aud the other to suggest what labour adjustments should be made in order to increase labour productivity.

IN the course of his lecture Mr. Joshi expressed the hope that the technical information contained in the report regarding the working and organization of American mills would be very useful to the Indian technicians. A peculiar feature of the American industry was that the whole structure of American cloth production was based on specialization of various processes for treating cotton right from blow-room to the spinning point and treating yarn right from winding to weaving for the production cf cloth. Complete standardization in sales in order to meet the manufacturing requirements was another factor which has brought about the success of the American mills in increasing the productive capacity of the operative to the maximum.

The reorganization of the American industry during 1900-37 was effected with the one object of making the automatic loom a success. In order that the automatic loom should produce the maximum cloth and that the maximum number of looms should be attended by an operative, cotton mills in America destroyed the old plant, carrying out the necessary changes in spinning as well as in winding and sizing.

Specialization, standardization and automatic looms do not exist in India and there is no hope of early introduction of these methods in the Indian cotton mills; so we have to see what can be done to increase the yarn and cloth production with what we have to-day.

Indian Mill Staff Can Hold Its Own

Mr. Joshi further pointed out that the technical staff employed in Indian cotton mills is quite capable of giving the same results as in America provided they had the facilities, plant and equipment as in U.S.A. mills. The same applied to the operative. Mr. Joshi was sure that the skill and patience exhibited by the technical staff and the textile operative is perhaps in no way inferior to that of the American technical staff and the operative. The cotton industry in India is adaptable to any sort of change which has to be put into effective operation by the staff and the operative whereas in American mills this state of affairs does not exist. Whenever changes in counts of yarn on the same machinery right from 6s to 80s and short lengths in weaving have to be effected it demands greater skill and attention on the part of the technical staff and the operative who have to carry out the job with economy and efficiency and less wastage.

Features of America's Spinning Plant

Mr. Joshi commented on the most important features of the U.S.A. spinning plant, such as the use of blending hoppers in the opening room, single process opening, use of twin combers and of lap winders, use of high-drafting systems at the speed frames, and complete elimination of bobbin creels from the card room in some cases, use of high drafts in ring spinning, and overhead travelling cleaners. Mr. Joshi explained in detail the differences that existed in U.S.A. and U.K. between the mixing system, the opening treatment, moisture control, carding, combing, drawing, speed-frames, ring-spinning, varying sizes of packages twist in yarn, the relationship existing between coun tand staple, yarn breakages, cleaning arrangements employed in spinning mills and type of spindles used between the American and U.K. mills.

Most of the working conditions existing in the above departments were more or less known to the technical staff in India and there seemed nothing new, but he considered that it has its educative value and technical men in the textile trade should not forget that any piece of technical knowledge obtained by a study of this report would certainly assist in improving the standard of work which they are carrying on in India to-day.

Immediate Improvements Suggested

Mr. Joshi emphasized the need for immediate improvements in cotton mills for increasing spinning production and laid stress on changing the existing low-draft ring-frames into high-drafts in spinning and flyer frames where possible, on the introduction of 12″ card cans instead of 9″ ones, on the possibility of increasing the size of packages at every machine. As supplies are to come from the United Kingdom, he pointed out that one has to apply one's mind very carefully before orders are placed, keeping in view the improvements which can be carried out immediately after the materials ordered are obtained from the United Kingdom. The U.K. manufacturers of machinery, perhaps, may not be able to supply the full needs of India during some years to come and, therefore, one has to think of conversion materials as the immediate need to increase production. Any haphazard orders placed for a machine or two would not produce beneficial results.

Shortage of Skilled Labour

Mr. Joshi was of opinion that there was no shortage of man-power in India as it existed in U.K., but he felt that there was shortage of trained and skilled labour. He was of opinion that this difficulty could be overcome by spread of general and textile education on a wider scale and necessary means may be forthcoming for this purpose from the funds which would be accumulated with the Government of India on account of the Cotton Textile Fund Ordinance of 1944 under which a 3 per cent. export duty has been levied on cloth.

India's Bottleneck

It was pointed out that Britain's bottleneck is labour and India's bottleneck is the required plant and equipment and certain conversion materials for increasing production, U.K. being the only supplier. The textile engineering works in the U.K. would be busy with re-equipping cotton mills in U.K. according to the suggestions and recommendations made by the United Kingdom Mission which Mr. Joshi was sure would be adopted by the U.K. Ministry of Production. Thus India's need for plant and equipment may be treated as secondary. Therefore technical men employed in cotton mills should be very careful in advising millowners as to what should be exactly ordered keeping in view that India needs more yarn to-day. Mr. Joshi rightly pointed out that it was no use building castles in the air and thinking of reorganizing India's industry on the basis of U.S.A. The existing conditions do not provide for such schemes to be put into operation. It is true that there is some scope in future to think on the lines of U.S.A. but it might take a very long time before any scheme could materialize. In the end it was suggested that a committee should be set up by the Textile Association to study the conditions of cotton mills. This Committee should draft a questionnaire which should be circulated to all the mills in India. Perhaps all the mills may not co-operate in submitting the returns but a fair idea could be obtained from the replies received on which the Committee can base their calculations with regard to the need of the spinning industry for India so that increase in production may be brought about in future. Mr. Joshi explained that from what he knew textile machinists in U.K. were competent enough to supply the latest types of textile machinery with the latest improvements and modifications which are second to none even when compared with U.S.A., but the problem was that this supply will not come in the near future. He also pointed out that the cotton industry in India remained in its stagnant condition during the past 40 years on account of depression. It was true that the control of the mill industry is now passing on to the stock exchange financiers and it will be difficult to judge as to what would be the state of affairs of the cotton industry in the near future.

Preparation

The practice of preparing warp in U.S.A. appears to be largely through the use of high speed (Barber-Colman) automatic spooler and high speed warper. The United Kingdom mills are still using the upright spindle winder and beam warper as is the case with Indian mills. The U.K. Textile Mission has thus compared the production per man-hour in warp preparation of the U.S.A. and U.K. mills, keeping in view the wide difference in plant. British p.m.h. over the range of counts taken is less than the American by 79.5 to 85 per cent. in winding and by 78.5 to 88.7 per cent. in warping. British labour requirements range from 4.9 to 6.7 times the American in winding and from 4.7 to 8.9 times the American in beaming.

In weaving, several cloths having similar manufacturing particulars have been compared, keeping in mind that American practice is based on the automatic loom whereas British practice is based on the four-loom system for coarse cloth and six-loom system for medium and fine cloth, with hand drawing and twisting.

On the basis of total output and total labour force British weaving mill production per man-hour is less than American by 57.1 per cent. for coarse yarn cloth, by 66.9 per cent. for medium yarn cloth and 56.3 per cent. for fine yarn cloth. The British labour requirements exceed the American for these three cloth types by 133 per cent., 203 per cent. and 129 per cent. respectively,

Britain employs 86 to 89 per cent. labour on machines, 9 to 12 per cent. ancillary and 2 to 3 per cent. supervisory labour, whereas America employs 43 to 48 per cent. machine labour, 44 to 51 per cent. ancillary and 7 to 11 per cent. supervisory labour.

It is clear, however, that while the cloth production per loom is more or less the same in the U.S.A. and U.K., there is a very big difference in production of cloth per operative on account of a larger number of automatic looms attended by the operative in America. Cloth production per operative on 48 hour-basis for American coarse, medium and fine weaving mills is 1,766 yds., 2,568 yds. and 1,491 yds. whereas this is only 757 yds., 847 yds. and 652 yds., respectively, for similar British cotton mills.

Work-Load Assessments Tests

In American mills regular observations are made to determine the number of loom stoppages per hour. If the stoppages are found to be higher than the basic figure steps are taken to ascertain the cause. Number of looms attended by the weaver depends upon the number of loom-stoppages. By checking loom stoppages regularly loom efficiency and production, defective work and fixing, and work-load assessment are always under observation.

For the successful working of a work-load assessment system a co-operative labour force is essential. Such a labour force exists in American cotton industry and provides unlimited scope for the users of the most modern machines and scientific methods in the industry. The number of looms supervised by a weaver are changed as circumstances require and as scientific investigations prove desirable. For example, a low-reed cloth will permit of more looms per weaver than a high reed cloth, all other things being equal. The fundamental consideration is the amount of work a weaver can perform in a given time. In the case of a weaver this work consists mainly of repairing broken ends and weft and starting looms.

The Automatic Loom

The automatic looms in use are manufactured by Crompton and Knowles and Draper Company, the former being bobbin-changing and the latter shuttle-changing type. Recently many improvements have been made in loom design, such as pressure lubrication and anti-friction bearings. The newly designed looms are running successfully 20 per cent. faster than old models.

American mills use high speed machines in folding departments. Rolls of cloth about 250 yds. long are conveyed to the cloth warehouse where ends are stitched and cloth is then passed through shearing machines having rolling attachments, then to the inspecting machines fitted with fluorescent lighting for recording faults. For a cloth output of approximately 100,000 yds. per 48-hour shift the cloth department would be equipped with 3 shearing machines, one rolling machine, 7 inspection machines, 7 folding machines, 8 grading tables, 4 long grading tables, 1 cloth stamping machine, 2 cloth baling presses and 1 platform scale.

In the opinion of Mr. Joshi there seemed no necessity to comment on the plant, equipment and organization of British cotton mills as these have undergone little change during the past 50 years and the working is more or less on the lines of Indian cotton mills.

Management and Labour in American Mills

The management and labour of American mills is worthy of study and if possible their ideas should be introduced in Indian cotton mills. The handicap of Indian cotton mills from the point of view of improvement is still (i) a fair amount of old staff existing in departments which is not amenable to any change in the century-old methods followed by them and (ii) want of flexibility in adjusting labour to look after more machines when such opportunities arise on account of strong trade unions.

The peculiar features of American mill management are:

(*a*) The American mills employ young technically trained officers between the age of 30 and 40. These young men find their way into such positions by offering their services during college vacations. Mills are generally keen on securing the services of a student during summer months. (*b*) No procedure or practice is regarded as permanent and improvements are always taken in hand. Experiments are frequently made to establish the most economic balance between machine and labour efficiency. (*c*) The importance of research is fully appreciated in American cotton mills.

Labour

Labour employment on machines is based largely on scientific work-load assessment by detailed analysis and measurement of the time spent on the various duties comprising the operative's job, as the assessment is made on the number of producing units which an operative of average skill can supervise without hardship.

The percentage of idle time is regarded as rest time. If the rest-time percentage regarded as necessary is 10 and if a weaver is not in a position to obtain this, then the weaver is considered to be overloaded and the number of looms under his or her charge is reduced until the standard rest time is reached. The value of the rest-time percentage varies with the type of work and may range from 10 to 20 per cent. the higher allowance being made for the heavier jobs, such as ring doffing.

Work-load assessments also form the basis of the wage rates for many of the machine operatives and for a given amount of production by an operative of average ability, a standard wage rate is established. If an operative produces more than an average then a bonus rate is added to the standard.

There is no fixed rate of wages in American industry and individual mills have their own wage rates fixed in agreement with workers' representatives. Of course, there is a fixed minimum hourly rate fixed by legislation.

The peculiar feature of the American mills is the high degree of flexibility in the utilization of labour. No difficulties arise to prevent either employer or employee from trying different methods of staffing or apportioning of machines per operative, which might result in more efficient and economic production. For example, if by increasing the twist factor in spinning from 4.3 to 4.75 the yarn breakages are reduced by, say, 20 per cent., then the work of the operative is correspondingly reduced and she can be given a greater number of spindles to supervise for the same expenditure of effort. It is praiseworthy that an understanding exists between the management and operatives that when major changes take place in machinery and equipment, in methods of work, or in types of yarn or cloth, changes in work-loads and assignments would be necessary.

A mobile labour force is employed by American mills for assisting operatives when machine stoppages such as doffing are involved. This force includes learners under the supervision of an experienced operative or instructor.

Labour specialization or gradation is practised in American mills. It is this practice which accounts for much higher percentage of ancillary labour which is economical on account of very high wage-rates.

For training labour vocational schools are in use where workmen attend after the shift work. At many schools no fees are charged or, when fees are charged, they are paid by the mill. American mills employ more men workers as the larger number of units supervised by machine operatives demands this.

Labour shortage is generally greatest during the third shift. Production in the third shift is also the lowest and probably uneconomic.

The average age of the American operative is considerably lower than that in Britain. This is of great importance so far as automatic weaving is concerned as agility and quickness of movement are considered essential for high efficiency.

Living Conditions

The conditions under which the operatives live in the mill villages or towns are much better than those in Britain. The mills in the Southern States are located in clean and attractive rural surroundings and constitute the only industrial organization in the village providing a livelihood for the greater part of the population and social, educational and other services of the community. Workers' houses generally consist of 3 to 5 rooms; they are often owned and kept in good repairs by the mill. These are lent to operatives at modest rents. Clean mill buildings having small gardens with an attractive country background present a contrast to the cheerless mill chawls in Bombay. The layout of these villages is planned by landscape architects and engineers and includes fine wide pavements, modern street lighting, well designed drainage and sewage systems, schools, churches, and community houses, shops, etc. The American manufacturer appreciates the importance of the operative's contentment and happiness outside the mill. Sir Victor Sassoon remarked, in his presidential address last year at the first All-India Textile Conference, that industries in big cities like Bombay had created slum areas for the workmen where they could not be looked after. He pointed out that in future factories should be planned in villages where workers could live with contentment and happiness.

None of the facilities indicated above for American mills exist in Britain, or, if they are existing, their percentage is very small.

The Platt Mission, in its recommendations to increase labour productivity in the U.K., states that (1) a higher degree of standardization or specialization is needed in Britain; (2) the general standard of technical equipment needs raising; (3) working conditions in British mills need considerable improvement; (4) greater co-operation between spinners and manufacturers of cloth must be established; (5) the managerial staff need more scientific training, and (6) economy must be practised in utilizing labour.

The changes contemplated by the Platt Mission as a result of their short-term recommendations are:—

Introduction of high draft in spinning and card rooms, use of 12″ card cans and big dia. flanges in warping and sizing and adjustment of labour so that more machines may be attended by each operative.

So far as Indian cotton mills are concerned, standardization or specialization within certain limits on a mass scale is possible. Indian cotton mills have manufactured and supplied large quantities of textile material required for Defence services during the war according to the standard specifications of the War Department. Thus there should be no difficulty in adhering to standardized production even for civilian markets once such standards are laid down.

Mr. Joshi at the end stated that other recommendations are worth adopting for general improvement in Indian cotton mills. With regard to labour adjustment some thought on co-operative lines is necessary. If a technical committee of mill managers is constituted to suggest what labour adjustments should be made in order to increase labour productivity of Indian cotton mills and these suggestions are jointly discussed with executives of the labour unions, some beneficial results would be produced, of course with Government backing, which is essential. If a proper line of action is not drawn up it would lead to confusion arising out of strikes, etc., on account of labour organizations misunderstanding the position. As an organization of the technical men in the textile industry, the Textile Association should have its voice heard on the question of labour adjustments, which would result in benefit to the industry. A sub-committee of the Association may, therefore, be constituted to examine this problem.

Platt Report and Lancashire Machinery

(*Concluded from page* 225)

technical experts should be appointed to conduct them, including progressive men from the spinning, weaving and finishing sections of the industry.

It may be presumed that the industry, in co-operation with Government and Labour representatives, will give very close attention to the recommendations made in connection with "Long-term" planning, but it is still far too early to state whether anything revolutionary will be achieved. All that can be said is that Lancashire is fully awake to the need for developing and maintaining a considerable home and export trade in cotton textiles after the war and that one of the prerequisites to success is a large-scale modernization of its mill plants, but it is also realized in many quarters that the highest possible output per man-hour does not necessarily mean lowest possible production costs and that a wholesale and slavish imitation of American practice would by no means guarantee an adequate and continuous market overseas.

ALL-INDIA TEXTILE CONFERENCE
SECOND SESSION 1945
Organised by THE TEXTILE ASSOCIATION (India), Bombay
27th and 28th FEBRUARY and 1st MARCH 1945
at the V. J. T. Institute Grounds, Matunga, BOMBAY

All-India Organization For Cotton Mills?

Another View of Rationalization

(*Specially Contributed*)

RATIONALIZATION has been much talked of since the movement began in 1921, when post-war boom was followed by a severe depression. Very many definitions have been given of the word "rationalization" by different authorities, the aim of all being to benefit the producers, labourers and consumers alike. In short, it consists in replacing traditional, antiquated and unsystematic methods of production and distribution by scientific and reasoned ones. It takes account of all factors affecting production, wages, efficiency, distribution and stabilization—a very wide term indeed. It is not merely financial reorganization, installation of up-to-date machinery resulting in displacement of workers, institution of scientific management or a combination of all producing units to eliminate competition, secure large-scale economies or increase production at lower cost. Such a change is *pseudo-rationalization* and not genuine rationalization. Much of the prejudice and opposition is due to the piecemeal and unscientific application of rationalization. Rationalization is meaningless if, with the introduction of up-to-date machinery, means are not devised by a process of reasoning and research to absorb the increased output and the released labour force.

Rationalization has a narrow as well as a wide meaning; in its narrow sense it can refer to one industry and in its wide meaning "to collective activities of the large economic and social groups." The latter is a problem of planning. In this brief article rationalization has been used in its narrow sense and as applicable to the biggest industry of India—the cotton textile industry.

The cotton textile industry occupies the most important status in Indian economy. There are at present about 400 mills with over 1,00,30,000 spindles, 2,00,000 looms consuming 48,00,000 bales of cotton, giving employment to more than 5,00,000 workers. In 1941-42 Indian mills produced 4,494 million yards of cloth and during the period 1st September 1939 to 30th November 1942—India exported 1,925,429,046 yards of cloth including 34,176,553 yards to the United Kingdom and 3,379,926 yards to the U.S.A. The problem before us is to maintain our industry in this flourishing state even after the war, and for this rationalization is necessary.

All-India Organization an Idealized Solution

Suggestions have, however, been made about the flotation of an "all-India Organization capable of enforcing its decisions." It is considered "*perfectly possible*" to float a joint stock company like the Associated Cement Companies Ltd., to manage all the Indian cotton mills, the new company to take over the assets and liabilities of all the existing concerns paying for stocks in cash and block capital in ordinary shares. If the industrialists do not voluntarily float such a concern the Government of India should take the initiative by passing an Act "authorizing the compulsory acquisition" of all mills. Let such a company be floated first and the "real technical difficulties about the valuation of assets and about the relative efficiency of different producing units among others will arise after the company has been floated. But it is possible to solve such difficulties with the help of *known methods.*" It is certainly easy to idealize solutions than to suggest really practicable measures. Associated Cement Companies is no instance on the point. The constituent companies of the A.C.C. do not probably exceed ten. It was floated when protection had been denied to the cement industry and it was doomed if the competing units did not combine. The number of cotton mills in India is about 400 and it is less than reasonable to expect that these 400 mills can combine under one organization, merging their separate entities. Even the Sugar Syndicate could not attract the membership of all the sugar mills, in spite of the crises of 1936-37, when first class sugar crystals were selling at Rs. 6-1-6 per md. in the Cawnpore market. Luckily for the Syndicate the popular Governments in the U.P. and Bihar passed the Sugar Control Act in 1938 and made it compulsory for every mill in the U.P. and Bihar to become a member of the Syndicate. In 1940, the members fell out and the Government withdrew its recognition. But in the interests of the industry it was restored after some time with the Sugar Control Board at the helm. Since then, the Sugar Syndicate has been almost a defunct body, the real power being vested in the Sugar Control Board and since 1942 in the Sugar Controller.

During the depression (in 1930) when the cotton industry was severely hit by foreign competition and other handicaps, a scheme to amalgamate 34 cotton mills in Bombay was launched by Sir Ness Wadia. It had been recommended by the 1927 Tariff Board and had the support and approval of the Governor of Bombay. Yet the scheme utterly failed owing to "technical and other difficulties." The valuation of assets and liabilities is a difficult job and there are no "*known methods*" which can be applied, e.g., there are two mills, one having a capital of Rs. 10 lakhs and the other, Rs. 20 lakhs. The former is giving a yield of 10 per cent. and the latter, say, that of 5 per cent. The former will claim capitalization of its profits and the latter will put its case as one where optimum production had not yet been reached and its return in future should be much more. This is a simple case; greater difficulties will arise where there are funded debts, mortgage liabilities, inadequate assets, etc. There is a great danger of the new concern being overcapitalized. The block capital invested in the cotton industry at present is more than Rs. 100 crores. What should be the probable amount of the capital of the new concern, which should purchase all the existing ones and pay for their assets and goodwill? How powerful should such a company be? This will be a great monopolistic organization and will be in a position to completely regulate supplies and charge any prices. Either the whole thing must be socialized or else if such a trust is left free, the consumer shall be at its mercy and will be in danger of exploitation.

Putting the Cart before the Horse

The proposal of floating the corporation before arriving at an agreement amongst the member-mills is like putting the cart before the horse. Without proper appraisal of the constituent companies, it is not possible to determine the amount and form of capital (owned and borrowed) that will be needed by the corporation. Therefore, the corporation should follow and not precede the agreement amongst the member companies. The fact that the conditions of production "differ radically from place to place makes it extremely difficult to arrive at agreed decisions" and to bring about one organization which would command the resources of all the mills in spite of the differences in their costs.

As regards Government control during the war and Government initiative in floating such a concern, it is a hard fact that Government control can be effective and successful only with the co-operation of the industrialists. The present control is justified by abnormal times and the industrialists know that it is not for the outright purchase where they will lose their identity. It is for a short duration. The millowners are under a subjective situation. It is now possible for them to obtain transport facilities, adequate and timely supplies of chemicals, coal, mill stores, raw materials, etc. The cost of production is fixed and adequate profits in addition to depreciation and replacements have been guaranteed. The Government, too, is in a position to provide all these facilities in these times when there is no foreign competition and uncertainty. In a post-war depression, the Government can neither be expected to shoulder this responsibility nor does it possess the requisite qualifications unless the system of Government itself is thoroughly changed. Moreover, the mills would not like to submit to Government control when they can get supplies of their requirements in competitive markets. Apart from it, in a world where the forces of the State are being prepared to fight trusts, cartels and other forms of combination which have thoroughly abused their monopolistic positions and privileges, as is clear from the anti-trust Laws of U.S.A. and the recent efforts of the London *Economist* to mould British opinion on the same pattern, the State in India would be putting the clock back if it tried to set up such trusts and thus sow the seeds of Fascism.

As regards organizing ability and managerial skill it is rather difficult to agree with the observations made in the article published in the July issue of the *Journal.* The factor we are most lacking in for the rapid industrialization of the country is organizing capacity and managerial skill. There is dearth of industrial leadership in the country at present. Even in highly experienced and seasoned industrial countries, the dearth of organizing ability has been the limiting factor in the expansion of industrial units. Apart from it, even if it could be accomplished, it will place hurdles in the way of the training of new industrial leaders and organizers which would be unfortunate for a country in our position.

In brief, the suggestion is unworkable and a retrograde one. Already we observe that Indian capitalism is shaping itself on the lines of British and American industrial organization. Big business houses like Birlas, Dalmias, Goenkas, etc., are creating combinations of a different character. Every one wants to have manufacturing concerns, insurance companies, banks, newspapers and trading companies to manage. What is needed is a proper regulation of these units in the interests of society as a whole; otherwise the problem will become too big to control after a while. We admit that for export purposes a centralized selling agency may be established that should study the tastes of foreign consumers, appoint agents, study markets and pass on the necessary information to the mills interested in the export business; but to propose a venture managing 400 mills with one and a quarter crores of spindles and two million looms is beyond our imagination.

Holidays with Pay in New Zealand *

UNDER the Annual Holidays Act, 1944, a system of annual holidays with pay for all workers became operative in New Zealand on 1st August. The Act provides that every worker, at the end of each year of employment with any employer, is to become entitled to a holiday of two weeks on ordinary pay. The holiday is to be allowed within six months after the worker has become entitled to it ; but, if the employer and worker so agree, it may be taken in two periods of one week each, and the whole or part of the holiday may be allowed in advance, before the worker has become entitled to it. Persons whose employment terminates before they have been allowed the holiday to which they are entitled are to receive the pay due for the holiday.

In cases in which employment is terminated after less than one year's service or less than one year after the last annual paid holiday in the same employment, the employer is required to pay the worker, in addition to all other sums due, an amount equal to one-twenty-fifth of his ordinary pay for the period of employment. When a period of employment is less than three months, the payment is made in stamps equivalent in value to one twenty-fifth of the ordinary pay due for the period of employment, or, where this period is less than three weeks, to one twenty-fifth of the ordinary pay due for the time actually worked during the period. These stamps are to be affixed by the employer to a special " workers' holiday card," and cannot be cashed until after the expiration of a year from the earliest period of employment in respect of which uncancelled stamps are affixed to the card.

The Act is not to prevent the operation of any more favourable holiday arrangements to which a worker may be entitled under any other Act or under any award, agreement or contract of service.

Employers are required to keep a record, to be called the " holiday-book," showing, in the case of each employed person, the name, dates of beginning and of terminating service, dates of holidays allowed, amount of holiday pay and other relevant particulars. The " holiday-book " is to be open to inspection by Inspectors of Factories. Infractions of the Act are punishable by fine, and, in cases of default, Inspectors of Factories may institute civil proceedings on behalf of any worker for the recovery of moneys due.

---

Lubrication-Oil Stains in Textile Goods

By Dr. G. ULLMANN, *Manchester*

(*Specially Contributed*)

THE question of lubrication-oil stains has occupied the textile industry continually for many years without having been fully answered. The problem must be considered from two points of view : on the one hand, with a view to the utmost prevention of the formation of lubrication-oil stains, and on the other hand, with a view to the easy and sure removability of those formed during processings.

Severest control and order, also mechanical equipment of suitable kinds, will assist in the prevention of lubrication-oil stains. This applies to all kinds of machines used in spinning, weaving, etc., and it is no less important in the finishing plants, where goods during manufacture and subsequent processes must be protected against such stains.

A most important matter is the arrangement of the bearings. They must not be directly above the machines, so that in this way splashes may not fall easily on to the goods. Drip-pans will avoid trouble, and they must be carefully emptied and cleaned at suitable intervals.

This, of course, is a matter to be worked out separately for each individual plant, in spinning mills as well as weaving mills, etc. In an interesting article on page 100 of the November 1937 issue of the American journal *Cotton*, under the title "Oil-stains on Yarns are Unnecessary," the parts of spinning machines where trouble mostly appears are discussed in detail. In weaving, above all, it is necessary to keep clean all parts which are permanently oiled, and are situated near the goods.

In the December 1937, issue 12 of the *Monatsschrift fuer Textil-Industrle*, Leipzig, there are, on page 309, many detailed references in reply to a question dealing with the prevention of lubrication-oil stains, for which reason this publication is especially mentioned.

The keeping clean of all parts of the Jacquard looms also needs special attention, in order to prevent dirt therefrom getting on to the much more expensive fabrics, because they are woven in so firmly that the removal of the stains becomes more difficult than ever.

Thus, a great deal can be done to prevent lubrication-oil stains, and preventive measures are certainly the best and cheapest way. One can, almost at the first inspection of a factory, judge the manner of a plant's management by the number of piecegoods cleaners employed there relative to the number of looms. It is not always known to the manager how much time the worker occupied in this department spends on the removing of grease spots and how much time he spends on the other work he has to do, such as nopping, cutting off the ends of the threads, marking for the eventual repairing of defects of all kinds, etc. The result is often surprising if, for trial, first on several pieces, only the lubricating-oil spots are treated and then, in a second operation, all other cleaning work is done showing the relative times taken. If one also takes into consideration the cost of chemicals for cleaning and the eventual decrease of value of the cloth, which often cannot be entirely avoided even with the utmost care, as in most cases the stains cannot be removed to a point of invisibility, the calculative importance of increased precautionary measures must begin to be appreciated.

But the discussion of these mechanical and control measures are not the chief purpose of this paper. It deals chiefly with the advisable composition of lubricating oils and with the methods of cleaning stains therefrom.

The composition of the oil and its correct selection influence essentially the formation of oil stains, because, if the oil-film adheres sufficiently closely to the bearings, there is less risk of the oil of the bearings being spattered on to the goods. If the temperature of the work-rooms, which often changes, is also taken into consideration, the selection of the most suitable type is not too difficult. Extensive study has been made to blend a type of oil which can be more easily removed during finishing operations. Of course, the lubricating effect must not be influenced by blending the oils with such components which assist in the removal of oil spots.

One of the oldest methods of preparing such types of oils is mixing them with easily saponifiable vegetable oils, especially rape oil, which is transformed into ordinary soap during cleaning by treatment with weak alkalis, such as carbonate of sodium, etc., and thereby emulsifies the mineral oil spots and removes them from the fibre.

It has been found that in order to obtain a really satisfactory result, the rape oil quantities must be increased to 75 per cent. of the oil, so that the final product contains only 25 per cent. of mineral oil. The minimum mentioned in the publications of the *Bulletin de la Societe Industrielle de Mulhouse*, discussing these matters, is a mixture containing 40 per cent. mineral oil with 60 per cent. rape oil.

Furthermore, attempts have been made to add to the oil, instead of rape oil, organic substances, mostly salts of organic sulphonic acids, naphthenic acids, etc., and considerable progress in this direction has been achieved by adding to the lubricating oil 15 per cent.—20 per cent. of such substances so that the mineral oil quantity, which is the only component of importance for lubrication, is much higher. Nevertheless, such blendings generally have not proved as completely satisfactory.

Of essential importance for the removability of the oil stains is the composition of the lubricating oil itself. Lubricating oils are invariably mixtures of various hydrocarbons and other ingredients, the exact composition depending on the crude oil from which the oil has been prepared. They vary, for instance, in their content of extremely obnoxious asphalt-like impurities, paraffin waxes and so on, though it is possible, to some extent, to remove these compounds from the oils.

Particularly inconvenient are the paraffins, where one must distinguish the so-called hard paraffins which have a higher melting point, from the soft paraffins which melt at a lower temperature. The former make the removal of the oil stains very difficult.

The yellowish-brown colour of the oil stains is no indication as to their removability, for in spite of the paraffins being uncoloured, their removal from the fibre is generally much more difficult than that of the real mineral oil stains. The same applies to heavy vaseline oils.

Here must be considered whether the real necessity is entirely to remove an oil spot from the fibre, or only to make it invisible. The former is inevitable in all those cases in which goods soiled with oil stains are subsequently subjected to a finishing process, such as bleaching, dyeing, printing, etc., because even if the colour of the spot disappears, the stain is not likely to be entirely removed, and in the finishing of such material there appears the known irregular effect, which depreciates it.

But in the case of goods which are not eventually bleached, dyed or printed, e.g., fancy woven goods, where only the visibility of the stains must be got rid of, it is sufficient if only their colour is removed, even if certain residues remain on the fibre. In such cases the so-called "white oils" are useful. These, which are considerably dearer, are light-yellowish to almost white, as, e.g., the oils normally used for sewing machines. Such light or white oils are mostly produced by bleaching the mineral oils with concentrated sulphuric acid.

Trials were made treating oils by similar processes to those used, for instance, in heavy bleaching them, etc. The results were not without a favourable effect, but were not as yet entirely successful. Nevertheless, these are experiments which should be continued.

But a considerable improvement of the oils can be obtained before using for lubricating by filtering them thoroughly through sand, coal, wood-wool, cotton and especially clays, either in the user's plant or in the refineries. Certain oil suppliers themselves recommend this working method, but in general the textile mills do not take this action. The effect is a good one and every plant is well advised to try out the possibilities.

Returning to the question of paraffins: it is the task of the refineries to remove them, especially the hard paraffins, from the oils. This is mostly effected by diluting with some low boiling solvents and cooling the oils down to a very low temperature at which the paraffins are solidified, thus "freezing them out" and they are then removed from the oils by filtration. In this respect, the origin of the oils is also very important, as certain oils, for instance Russian, are relatively poor in paraffin, and therefore more suitable for textile uses.

Hitherto, the composition of the oils and its influence on removability have been discussed. But this is not the only factor which influences the removability of the oil stains, as the stains also contain impurities, which do not come from the oil, but from the processings, for instance, from the bearings, from dust, and sometimes very disagreeable impurities from graphite and lastly also from metal fragments which have been rubbed off, such as iron, copper, etc., which are very troublesome in bleaching and dyeing because of their catalytic effects. But there are improvements in progress in this respect, by manufacturing the bearing, and perhaps also the shaft material, from new artificial material which is not metallic, or by protecting these parts with such material. Also the use of new types of stoneware for bearings is being studied, for instance, types of alloys of stoneware and silica, which are remarkably good conductors of heat.

A necessity, sometimes not sufficiently recognized, is that the oil has to be taken often out of the bearings, filtered and then returned, after the bearings have been carefully cleaned. Also "pure oils" make spots while "ageing" on the tissues. There takes place on the goods an oxidation or resinification process, which also causes a darkening of the oil stains, and in this way renders their removal more difficult, especially as in storing they infiltrate more deeply into the fibre.

Singeing, to which nearly all textile goods are subjected before finishing, and steaming, often employed with woollen and rayon goods, cause an unfavourable alteration or enlargement by a deeper infiltration of the stains into the goods, all of which makes the removal more difficult.

For this reason, it is impossible when testing varieties of oil or mixtures, on fresh stains, to foretell how easily they will wash out. Such fresh stains are nearly always comparatively easy to remove. Therefore these tests must also be carried out after a longer storage of the stained goods at a somewhat higher temperature, or after singeing, steaming, etc. Further, it would be good to mix a little of the dirty residue, separated during the filtering of used oil taken from the bearings, with the oil which has to be tested.

The artificial fibres more easily become stained because of their high absorbency, and the stains more quickly penetrate to the interior of the thread. In addition, the removal of the stains from such fabrics has to be effected with much more care than from fabrics of natural fibres, because they must not be rubbed. Then again, compared with naturals, the artificial fibres are much more sensitive to many of the chemicals used for spot cleaning, so that many of the solvents used for natural fibre materials have to be avoided.

In removing the stains, one must distinguish between two cases, viz., the first, in which with fancy woven or ready finished goods a wet treatment cannot be taken into consideration, so that only a local cleaning can be undertaken, and the second case in which the goods are subsequently subjected to a wet treatment. The latter is the case, for instance, with bleaching, dyeing and printing.

Sometimes with delicate goods coming from the machines, the two methods are combined; that is to say, the woven or knitted goods are at first treated with a local cleaning process, before being processed by the wet treatment. A wet treatment before singeing would theoretically be quite favourable, but this is mostly economically impossible.

For the removal of oil stains locally there have been in use for some years many solvents for fat and oils of all kinds, the enumeration of which can be omitted here. But the really good solvents are not at all cheap, and the treatment itself is not always very simple.

Great care must be taken that an enlargement of the oil stains through local treatment, the so-called formation of "halo," is avoided. This necessitates the avoidance as far as possible of a rubbing of the oil stains and their removal, to a great extent, only by dabbing them on a suitable support till the eventual residual solvent is entirely removed by washing with soap, sulfonated oils, alkalis, *solvents for fat, etc., in various combinations.*

A process regarded as very good for avoiding " halos " is the preparation of a paste of a solvent, etc., with suitable substances, such as magnesia usta, powdered gypsum, etc. The paste is applied to the stain, and not rubbed, but pressed on it. It absorbs the oil and, after drying, the powder is brushed away.

This working method is based on the idea, which is absolutely right, of removing first of all the oil on the goods and the accompanying impurities. It is then easier to get rid of the dirt on the goods by a subsequent local wash, as described above.

It was successfully proposed by the author that the paste be made with other substances instead of magnesia, substances, which owing to their morphological formation, have a greater absorbing capacity, that is to say, which soak up by capillarity the solvent and the extracted oil contained therein, as such substances, especially tannins, proved very good, preferably the so-called bleached, almost light yellow kind, and further, since even bleached tannin has a certain colour, powdered sugar.

A prominent specialist continued these studies, and the best results were obtained from a paste made of a solvent mixed with a highly active finest dispersed clay, for instance, with a French material known under the trade-name of " Sisol " but other similar suitable products are also available.

The importance of the whole problem is clearly to be seen from the fact that the " American Society of Textile Chemists and Colorists " has studied it together with the " National Union of the American Finishers of Textile Stuff," and in February 1937 there was established a committee which published a report about the usefulness of various cleaning materials.

A detailed report about this was published in the journal, *The Dyer and Textile Printer*, in the issue of April 9th 1937, page 399. Some general properties (specifications) were quoted for the fat solvents which can be applied without trouble to goods which are subsequently to be bleached, and prescriptions for their employment have been published too.

These agents must not contain any free *alkalis other than ammonia*. They are to *be applied to the stains with a sponge only, without any rubbing. The stains will then be removed entirely by the regular* bleaching operation. If oxalic acid is also used, as is often necessary to remove iron spots, the fabrics must be thoroughly washed afterwards. There must be more caution with the use of fat solvents on artificial silk, when the composition is not known, and it must be pointed out that acetate silk is especially sensitive to some products, for instance, acetone and free alkali.

There is published in the report a list of solvents for fat which can be used without trouble in connection with the bleaching of fabrics from cotton and man-made fibres. Amongst them are oleic acid, Turkey Red oil, soap from olive oil, castor oil, tallow and rosin oil, and, for removing rust, i.e., iron, fluorides and oxalic acid, which must immediately be carefully washed out. Further recommended as effective solvents of fat are tetraline, hexaline, chloroform, carbon tetrachloride, naphtha, all these separately, or in mixture with soap or sulfonated oils or similar products.

A recipe for a suitable stain-washing agent is quoted here :—

White castor oil soap ..	10½ kilos
Chloroform	½ kilo
Ammonia of 26° Bé ..	3 kilos

However, although the use of chloroform, which is a solvent for fat, is in fact very successful, it is not very much favoured because of its narcotic effect.

One must be warned in the treatment of artificial fibres or goods containing artificial fibres against amyl acetate, unsaponificable oils or waxes, emulsions of linseed oil, or other not easily saponificable oils, or mixtures containing such products. No other acids or alkalis were recommended but oxalic acid and ammonia. A recommendation coming from such a prominent body merits full consideration.

Of course, the list of suitable solvents for fat is not complete as appertaining to it are also methylhexaline, benzine, ether, trichlor-ethylene and other volatile substances, for instance, also certain special products like Emulphores, Lissapol, Silvatol (Graphite stains !), Laventines, Tetrapol, Perpentol, etc., are admissible. However, they are not always acceptable in respect of costs. There are also many different kinds of sulfonated fatty alcohols which have very good properties.

The second above-mentioned method of removing oil stains consists of a complete wet treatment of the goods, as is always the case with bleaching, etc., and the pre-cleaning of fabrics by washing, soaping, etc.

As additions to bucking liquors for fabrics of vegetable or artificial fibres a fair number of products have been recommended for many years, amongst them several of the abovementioned, but these processes have not been used generally or have been considerably limited. Nor does literature show itself optimistic in this respect. See, for instance, information on pages 100 and 275 of Dr. W. Kind's standard work, *Bleaching of the Vegetable Fibres*, in which there are very valuable observations about the whole question of oil stains and many references to patents, processes, publications, etc. If one takes insufficient quantities of the fat solvents mentioned, the result is not satisfactory. If one uses sufficient quantities, the process is often too expensive. However, good bucking generally produces satisfactory results, but one must intensify and prolong the operation, and eventually buck twice if the goods contain many oil stains.

The best method of removing oil stains is by treatment with light petroleum, an operation which, however, is not very agreeable, but which nevertheless has become popular for certain articles, as, for instance, fine wool and rayon fabrics. Only it is difficult to remove the petroleum from the goods, which, however, can be done, though it is expensive, by a subsequent wash with some solvents.

In several plants the stains are only thoroughly dabbed with petroleum, or the goods are drawn through petroleum, and remain in this state several hours, so that the petroleum completely penetrates the fibres and thus promotes the loosening of the oil stains, enabling them to be removed at the subsequent wash with the products mentioned, or eventually by lukewarm washing with soap only. If the goods are dabbed with petroleum, great care must be taken that all rubbing is avoided, as this would cause scouring stains on the fabric.

The chief trouble with the use of petroleum, and also with certain other effective solvents, is that it is extremely difficult to emulsify it in aqueous solutions, as these solvents separate very quickly and are then completely lost for the cleaning process.

Thus, the problem is to avoid the decomposition of the emulsions of solvents and oils in aqueous solutions. This has been secured in a very clever way by mixing various cleaning agents in such a manner that the solution has a *specific gravity of approximately* 1. It is obvious that such an agent does not decompose in a watery medium. On this principle, one can combine all kinds of preparations at one's disposal and will do so always with regard to the prices of the products in question. This working method is especially favourable for the washing of the aforementioned light woollen and rayon fabrics, silk, half silk, etc., which must not be treated harshly. Such a mixture is, for instance, made of Trichlor Ethylene, Hexalin, Tetralin, and a fraction between petroleum and benzine, as used by many chemical cleaners, especially in America and in England, too, under the name "Stoddard Solvent Naphtha."

These mixtures are stirred up in solutions of a highly sulphonated oil, and the final mixture emulsifies perfectly in water and in this state somewhat resembles skim-milk. The emulsions can even be added to the bleaching liquors, and the goods can be pretreated on the jigger or the vat before dyeing, putting them even in dyeing baths.

The effect of this working method is that by retaining the specific gravity of approximately 1, a decomposition of the emulsion and especially a separation of the petroleum fraction which has almost the best cleaning effect is avoided. The emulsion keeps several days so that spent baths can also be used. Then again, these chemicals are easily washed out, especially in a weak soap bath to which advantageously may be added small quantities of highly sulphonated oils, etc., or sulphonated fatty alcohols, or sulphonated products derived from mineral oils.

From all these comments, it may be gathered that actually one is not yet able to make final proposals for the removal of lubricating oil stains, even if they are reduced to a minimum. Neither can one do without lubricating oils from which the stains are easily washed out, nor of methods that enable people to remove these stains in an easy and sure way. Nevertheless, there are already advances which have been made in this direction and from which the trade can profit with success, some of which, already having proved good in practice, have been described.

Finally, reference may be made to the extensive literature devoted to this question in technical journals, technical books, lectures, etc., of the textile industry. Several publications have already been referred to above. Here we quote especially the many and extremely useful publications which appeared in numerous volumes of the *Bulletin de la Sociètè Industrielle de Mulhouse*. This leading society, which is in close touch with practice, has especially kept under observation the question of the troubles of oil stains and their moderation.

A proof of this, and also of the great difficulty of the problem itself, is to be seen in the fact that the above Society has published a prize subject as far back as 1894 (No. 34 Bleaching), which concerns only a part of the whole problem. The prize question had the following text :—

"Practical methods for removing mineral-oil stains in cotton fabrics, caused in weaving. The process must be generally practicable and must not influence considerably the price of the bleaching operation.

By the methods of bleaching hitherto in use, mineral-oil spots cannot entirely be removed, and they appear in the dyeing and bleaching operations. A cleaning operation by hand will not be judged as a solution of the prize question."

It is significant that, at least by 1938, thus after more than 40 years, the Society was still not in a position to grant the prize. Further, there appeared in the reports a fair number of publications, elaborated in detail by first class experts, the perusal of which may be recommended to all those wishing to occupy themselves intensively with this question. In 1913, there appeared, for instance in the said *Bulletin*, pages 512-608, a very extensive report, introduced by a short review of the famous experts, Mr. Albert Scheurer and Edmond Wallach, entitled *Recherches sur les Taches d'Huile Minerale* and by reports of Mr. de Chambrier and final remarks of the above authors, with extremely instructive information. And the great series of reports was concluded by the statement that so far a solution of the problem has not been found ! !

In the April 1928 issue of the same *Bulletin* are extensive reports on the subject by Messrs. Mennecke and Picard, and a very detailed one, worth reading in every respect, by the renowned chemist-colorist, Mr. Victor Silbermann, of Messrs. Scheurer, Lauth & Cie., Thann (Ht. Rhin), which is also recommended for full consideration.

The researches of Mr. Albert Scheurer are of previous years, and one part of the standard publications of this prominent expert deals with the behaviour of oil spots during bucking of vegetable fibres.

Finally, reference should also be made to the studies published some time ago on the theory of the lubricating effect, using Rontgen research methods, which gave altogether staggering results.

Some very interesting researches have been undertaken by a French author, M. Jean J. Trillat, which were carried out in the Institute of the Nobel prize winner, Duke de Broglie, Paris, and about which details can be read in the journal *Metallwirtschaft*, Berlin, viz., in Numbers 4 of 27th January 1928, and 50 of 12th December 1930. According to all this information, the lubricating agent arranges itself, on rotation in the bearings, lamella-like between the metal parts, comparable to a pack of cards, and this in such a manner that the single lamellas are connected with each other systematically and gravitate towards the outside, that is the metal part. The presence of "active molecules" increases this effect and is accompanied besides by adhesion—or adsorption—phenomena, by which it gives special properties to the oil film formed in this way, which cause its greasiness, and for its part, creates the lubricating effect and the adhesion of the lubricating oils to the metal.

If there are contained in the lubricating agent so-called "active molecules," as, for instance, vegetable oil or fatty acid, also saturated alcohols and substances with methyl groups, etc., these more active groups are drawn at the piling of the lubricating film in the lamellas to the outermost layers of the lubricating film, and claw, so to speak, to the metal of the bearings, by which the intensity of the adhesion, meaning the toughness of the lubricating film, is increased, or, especially important for our case, the danger of spattering from the lubricating oil from the bearings is considerably reduced. If the "active molecules" are acid salts, the protection of the bearings against their corrosive activity becomes still more important.

One can gather from this what influence additions to mineral oil have on the suitability of a lubricant, and for this reason also reference was previously made to the fact that one cannot designate as dispensable without any more ado those ingredients of oils which cannot be considered chemically pure mineral oils. The problem can therefore not be at all regarded as solved, and is worth further study to find out which types of oil meet with the wishes of the textile industry as well as the requirements of the lubricating technique. Here, too, is great scope for research, the results of which could be utilized by the practice of the lubricant production, as well as by the textile industry. But in the meantime, one must remain satisfied with empiricisms, and try fully to utilize the knowledge which already exists about injuriousness and usefulness of oil compositions.

The Survey gives the technical situation of pre-war times and the writer hopes to add a supplement as early as possible to bring it up to date.

Correspondence

Why Not Mobile Unit of Experts ?

IN the course of a letter addressed to us on the subject of post-war planning and development, Mr. K. K. Madan, hosiery technologist, J. K. Hosiery Factory, Cawnpore, writes as follows :—

"The right type of technicians should be selected who would assist the various directors to build heavy industries in our homeland.

A mobile unit of experts should be set up under the planning scheme to advise the experts and proprietors of the already running concerns and manufactories as to the ways of improving the quality as well as the quantity of their products. These touring experts should be really intelligent persons who should be able to pick up knowledge while touring. If in one mill, factory or workshop they see a good point they should note it down to advise the person who is totally ignorant about it. This would relieve the employer in India who always likes to change his experts to get another idea from another factory. The appointments and dismissals of keymen should ordinarily be in the hands of the Government or a body of non-officials set up by the Government for the purpose. To control the experts is to control the industry itself. The interest of the working man should not be ignored and all facilities should be given for research work. The big industrialists should be encouraged to open big laboratories for the purpose and such establishments should be subsidized by the Government.

The labelling of prices on the goods should continue even after the war as this method has already been proved very beneficial and effective and has relieved the casual buyer to a great extent. The competition between the mill and cottage industries should at once be terminated at all costs by strong legislation and every effort should be made to raise the standard of living of our countrymen by giving compulsory education till the age of 15. Stipends for higher education at home and abroad should be liberal and all the young men, having intelligence above the average, should be able to take advantage of it. Last but not least, the methods of agriculture should be improved to a considerable extent. All this would help the cause of industrial emancipation of our country."

Treatment of Silk-worm Eggs

Some Practical Suggestions

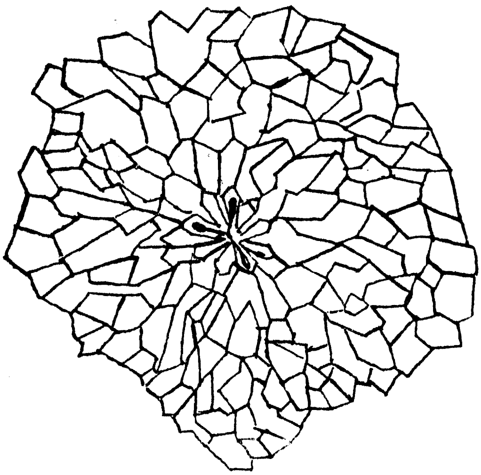
By V. M. APPADHORAI MUDALIAR

*Retired Assistant Superintendent of Sericulture (Mysore Service)
and ex-Manager, Kollegal Silk Filatures (Madras Government)*

(Specially Contributed)

ANYONE will be under the impression that the surface of the fresh silk-worm egg is quite smooth, but it is not so; under a suitable magnification, the surface of the shell will be found to have innumerable deep lines in the form of polygons; these polygons are actually found to be embedded in deep furrows surrounded by a network of V-shaped canals crossing one over the other. At the junction of each of these crossings the shell has very minute perforations, through these perforations the embryo takes in fresh air and gives out carbon dioxide till the embryo fully develops and comes out of the egg as an ant-worm.

Plate A



PORTION OF SILK WORM EGG SHELL WITH MICROPILE IN THE CENTRE

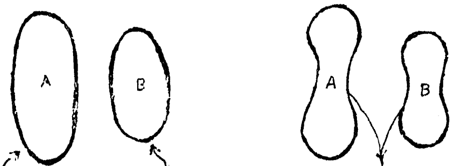
The shape of the egg remains intact without any change for a few days after the eggs are laid; within about a week the depression on the sides of the eggs will be noticed, the depression becomes deeper just prior to hatching, and all round the depression is the bulged out portion which is the fully developed embryo ready to hatch.

The position of the apertures made by the worm while hatching depends on the race of silk-worms. As a matter of fact, in the univoltine race of silk-worms, the ant-worm will make an aperture only on the side of the micropyle polar, either on the right or on the left side, whereas in the multivoltine races, the aperture made will be right in the centre of the micropyle polar.

The reason for this phenomenon is quite obvious. In univoltine races, the fully developed embryo will not be occupying the entire space available in the egg; there will be some space left in between the cephalic portion of the embryo and the micropyle polar; particularly on the 17th day of incubation the empty space could be seen clear and the embryo will be seen in the shape of the letter U. On the other hand, the fully developed embryo in multivoltines just a day prior to hatching will be found occupying the entire space in the egg, the cephalic portion will not only be quite close to the micropyle polar, but it will also be right in the centre of the polar.

Due to these peculiar positions the cephalic portion of the univoltines will be facing on any one side of the sub-polar; as such the ant-worm invades the shell and makes its aperture only in the sub-polar side. In the case of multivoltines, the ant-worm will invade only in the centre of the polar, hence the variations

Plate B



LONGITUDINAL SECTION OF SILK WORM EGG LAID FRESH (x 30)

CROSS SECTION OF SILK WORM EGG LAID FRESH (x 30)

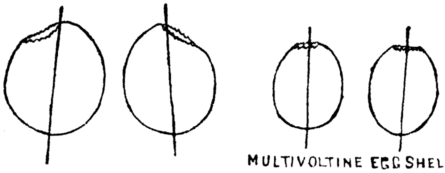
L & C. SECTIONS 6TH DAY AFTER LAYING THE EGG (x 30) in the position of the apertures in these two races.

It is immaterial whether the race is univoltine or multivoltine; they commence preparing their apertures by gnawing the shell and at the same time also consume the minute particles of the shell scraped just an hour or two prior to hatching. The minute shell particles consumed by the ant-worm serves as nourishment and gives the required vigour to scrape the shell at a stretch.

After hatching, the ant-worm will first evacuate the shelly particles consumed in the form of excreta in very minute particles. It is only after this evacuation that the ant-worm will start feeding on mulberry leaves. The aperture all round will not have a smooth surface, but in a saw-like denticles.

After the aperture is made, the ant-worm will first thrust its cephalic part of the body and by regulated movements of the body it comes out of the egg with ease.

Plate C



UNIVOLTINE EGG SHELL AFTER HATCHING WITH SUBPOLAR APERTURE (x30)

MULTIVOLTINE EGG SHELL AFTER HATCHING CENTRAL POLAR APERTURE (x30)

But in rare and exceptional cases rearers by chance might have observed that instead of the cephalic portion coming out first, the tail end of the body shows its appearance. This would happen only when the embryo or the ant-worm is weak. The weak ant-worm will not stand the strain of preparing the aperture at a stretch, but needs rest on and off; during the resting periods the embryo will keep on changing its position each time the embryo rests. This constant change of position causes the tail end of the body to come near the aperture. So the tail end finds a way out first; the ant-worm in utter confusion starts pushing the body in backward motion and succeeds in pushing out easily up to the thoracic portion. The actual struggle starts when the cephalic portion nears the aperture. Due to its being thicker than the rest of the body, the ant-worm cannot thrust this part of the body easily. Somehow the ant-worm tries with all sorts of contortions without any success, and succumbs in this struggle. If by chance, say, one in a thousand were to come out alive, it will be found fully exhausted and will not survive long.

The above facts make it clear that the health of the worms during the course of rearing mostly depends on the care and attention paid both by the graineur and the rearer and the treatment given to eggs from the time of laying to hatching. Many graineurs and rearers in India do not in the least realize that they are dealing with live eggs and they should take due care in handling them delicately. It is quite common for rearers, when they go to grainages to obtain their supply of eggs, to roll up the egg sheets containing millions of live eggs. The rolls right away go under the arm-pit and even in scorching sun; there cannot be a worse treatment given to eggs than this.

The eggs from the time they are laid and up to the time of hatching need very delicate handling both by graineurs and rearers, such as access to free ventilation, loose spreading of egg sheets, maintaining as far as practicable uniform temperature in the grainage hall, particularly in summer, loose packing while despatching the eggs by post and to avoid piling up examined sheets till they are checked for rejections, etc., are some of the points to which the graineurs should pay proper attention. After all, in grainages microscopic examination of mother moths is only a part of the technique; the points stated above are also as important as microscopic examination of moths.

In fact, grainages are the very foundation, on which the development of the silk industry depends. If the fundamental principles are not observed by the graineurs there is absolutely no scope for the industry in India to prosper. It is of the utmost importance for both the graineurs and rearers in doing their best for the industry to thrive and to be in a position to withstand keen and cut-throat competition from Japan and China after the war. It is never too late to do their bit with a view to obtain 100 per cent. success in their sphere of work.

Calico Printing in India and Its Future

By N. K. PATEL

(Specially Contributed)

THE ancient Indians were pioneers in the art of calico-printing and their block prints had a great reputation in Europe. With the recent technological advances in the West, this leadership was abruptly lost and, in the first quarter of this century, India became a dumping ground for imports of cheap machine-printed fabrics.

The Indian machine-printing industry, starting shakily at first, made rapid strides after the prosperity following the world depression of 1929-33. Imports of textile printing machinery rose steeply, particularly during the three years preceding this war, and to-day there are over three dozen printing machines of foreign make in India, besides several of a rather crude type, made locally under the war impetus. Most of the imported machines are four-colour, and an odd few are six-colour. Normally most of the plants work two shifts, and according to rough estimates they print, on an average, approximately 200 million yards annually. This is the same as before the rise of the local industry in 1936, since when the imports had fallen to about 150 million yards.

This rapid progress was mainly due to the introduction, meanwhile, of easily applicable fast dyestuffs, specially adaptable to printing, such as the Rapids, Indigosols, Naphthols, and improved Vat dyes (in a more suitable state of physical sub-division or fineness to facilitate easy fixation). These dyestuffs did not require the same exacting skill and elaborate technique as that called forth in the application of older dyes, and gave scope for easy and rapid production, besides being more versatile in their use in obtaining varied colour effects. This upward trend would have no doubt continued, had it not been arrested by the abnormal conditions brought about by the war.

Indian mill production, though boasting of a good yardage, approximating that of previous imports, has, however, shown little signs of departure from the easily turned out straight prints in the direct style, on cheap voiles, chintz, etc. Single-colour prints, though gradually yielding to two and three colours, still comprise a large proportion of the total output, while the proportion of four colours continues to be negligible. The competition between the various mills is not in different specialized styles, but tends to get crowded into this limited field. They have not yet thought of striking any new or original line and, with very few exceptions, they have not even attempted to enter the market of imported varieties. A printing machine is capable of a huge output in these straight prints and, if such unprogressive trend continues, with further inevitable multiplication of machines after the war, a stage may easily be reached when the fittest only can survive. The likelihood of foreigners dumping in India the same type of prints as that locally produced is also another possible menace, which should not be lightly ignored. In fact, just before the war, Japan had already begun to make such attempts.

The type of prints produced by the Indian mills did not replace the imports, and had to create a new market for itself. No doubt, its indirect impact reduced the imports of specialized foreign styles to about $\frac{3}{4}$—$\frac{2}{3}$ of the original. This was mainly at the expense of the U.K., who at the same time suffered a further and more serious blow from severe Japanese competition. The latter, making rapid inroads in the Indian print trade, quickly wrested the export leadership from the British who had been enjoying a virtual monopoly. Latterly the Japanese exports also suffered some decline, as the Indian production mounted steeply, just before the outbreak of the war.

Almost all the specialized imported styles have, as a rule, a deep ground shade, either dyed or blotch-printed, on which stand out characteristic designs in more or less stereotyped white and multi-coloured motifs, which are peculiar to each particular style. This is in old oriental taste and, in many cases, the exporters have merely copied the old Indian hand-printed traditions and exploited them with modern machines and dyes. The ground shades are generally in Alizarine red, chocolate, and deep purple; Para-red, Alphanaphthylamine claret, and Metanitraniline orange on Beta-naphthol ; Indigo ; Aniline or Logwood black ; or the cheap and bright but loose basic dyestuffs according to the style. Alizarine is now being increasingly replaced with azoic combinations and each style has its own regional markets in India.

(A) Basic Styles

(i) White tannic discharges, or the "Acid-tannics," subsequently dyed up in bright grounds of basic pink, blue, turquoise, green and violet. To complete the assortment, ground shades of aniline (or direct) black, para (or Benzo) red, and alpha (or direct) claret are also included in the range. The designs are usually in white spots, checks, or stripes.

(ii) "Printed drills" in "Vat-tannics." The design is in four colours, in white, and vat yellow, green, blue, salmon, or overprinted black. The bright ground shades are dyed in basic blue, violet, pink, and turquoise, with para-red and meta-orange to complete the range. This is a difficult and tricky style, requiring expert technique and supervision.

(iii) Basic blotches. The grounds are as in (i) above, but blotch printed instead of dyed. The design is in white, and two other colours from the ground assortment. The four-colour effect is similar to (ii), but the process is simpler, and the use of costly vat discharges is avoided. A particular grape design is quite popular in this style, known in the trade as the "Grape quality." (ii) and (iii) may have vivid single borders (Gagra-pat) for skirts, and these are also produced on cheap rayon.

The basic styles were latterly almost entirely cornered by the Japanese. These have a wide sale, due to their cheapness, attractive finish, and bright though loose colourings.

(B) Aniline Black

These styles were also similarly cornered by the Japanese.

(i) Single coloured white designs on black ground.

(ii) Multi-coloured design on black ground, in white, and the bright basic pink, yellow, green, etc., in four colours. In both the above styles, the white is usually in a fine stipple, producing a characteristic effect on the black ground, named as "silver grey" or "steel grey."

(i) And, to a smaller extent, (ii) have been produced in India principally by the J. K. Mills of Cawnpore.

(iii) White ground prints. The design is a direct print of Aniline (or Logwood) black alongside red if required, in the two-colour assortment. The white is sometimes covered up with a bright yellow ground in a portion of the assortment.

(C) Alizarine Styles

These are now being increasingly imitated in the azoic combinations, to shorten the process.

(i) Chocolate jeans and shirtings, mainly from the U.K., but with increasing competition from Japan. The grounds are blotched in appropriate mordants, and subsequently dyed up in Alizarine to give chocolate, red, or deep-purple (almost a reddish black), leaving a design in white. For two-coloured designs, pegs in one of the remaining shades other than the ground, are printed within the white. A portion of the chocolate assortment has a bright yellow to cover up the white effects. The British Calico Printers' Association are known for their excellence of work in this style, under their trade mark "G.D.S." Latterly this style has been increasingly imitated in Azoic chocolate and red, and Logwood or Aniline black. The cloth is usually in splits. The Bombay Dyeing and Manufacturing Co. (and some other mills in fewer designs) produce this style in India, and there are signs that it will be increasingly taken up locally, in direct competition with the imports.

(ii) Chocolate (red and purple) *saris* in single colour ("Gavan"). These are on the same lines and colouring as above, but on altogether different designs and cloth, with side and cross borders. There is little competition from the Japanese, who have not gone in for cross-border sari-printing machines to any serious extent as yet. The same are also available in alpha-claret and para-red.

(iii) (*a*) Turkey Red gagras, jaconets, scarfs, etc. The ground is a deep shade of Turkey (Alizarine) Red, with allover uniformly spaced pink spots, and illuminated in vivid designs of pigment yellow, green and white. The characteristic designs are mostly geometric rather than floral. The style is produced without borders, or with single side border, or additional cross border also if required. The British firms, F. Steiner and the United Turkey Red Co. (The U.T.R.) are known for their high standard of excellence in this style. Latterly, it is being increasingly imitated in Azoic Red. In India, it is being solely produced by the Bombay Dyeing and Manufacturing Co. without the cross border. A variation in this style has pink in large floral designs instead of in spots, and sometimes a black colouring in the border in place of red.

This style is also extensively imported in the cheaper para-red, but with the omission of pink.

(*b*) " Acid red and pink " scarfs, handkerchiefs, etc. The ground is Turkey (or Azoic) Red, with large floral and pastoral designs in white (" Acid ") and pink, with or without borders.

(D) Para-red Style

(i) The gagras, jaconets, etc., have been noted above. There is a large variety of prints besides these, differing in designs and cloths, in the same colourings with additional blue and black to choose from. While the yellow and green in Turkey Red styles are usually pigments, these in Azoic and Para-red may be pigments or basic.

(ii) Para-Red *saris*. Some are on the lines of chocolate *saris* mentioned previously, but are dyed in para-red or alpha-claret, the design in white being a printed discharge or resist. Other para *saris* have small peg designs of yellow (with additional green at times) in the filling, and spectacular side and cross-borders in yellow, green, blue, black and white. The so-called " Peacock *saris* " have small peacocks in the side borders, and a single big gorgeous peacock in the cross-border.

(iii) A prominent blotch-printed style in para-red and meta-orange is on the lines of chocolate jeans, on poorer cloth, and different type of designs, with pegs of Logwood black within the white. The J. K. Mills of Cawnpore, and latterly the Ahmedabad New Textile Mills, produce this in India. Para-red and Logwood black alongside if required, are also printed in small designs on white ground, subsequently covered up with a bright yellow, in a portion of the assortment. (See B iii.)

(E) Indigo and Turkey-Red Blouse-prints

The ground is a medium depth of Indigo or Alizarine Red in blotch, and the design is in white, and dead-fitted objects in a much darker shade of the same ground colour. These are also imitated in azoic and chrome colours in a more varied assortment of shades.

(F) Japanese Chintz

These in single and multi-coloured designs, similar to the work of Indian mills, but mostly in looser basic or chrome dyestuffs began to make their appearance just before the war. Vat and basic discharges on medium tints of direct grounds, in modern pleasing designs on rayon were also being imported from Japan. Fancy prints on silks, and superior cotton fabrics were so few in the total yardage, that they may be neglected.

Should the Indian industry turn to these old-established styles to expand its scope, or strike new lines in colourings, designs, and styles ? The consumers' taste, though somewhat traditional, is bound to follow the changing times, being educated and moulded by what creative and enterprising manufacturers and merchants can offer for sale. With the growing appreciation of modern dyestuffs in respect of fastness, the demand for imported styles, most of which are wholly or partly in loose colours and in outmoded designs, will be questionable. Red, chocolate, deep-purple, blue and black have been among the favourite ground shades, only because these were the only deep prints available at one time with the vegetable dyes, alizarine, indigo, and logwood. Moreover, some of the cheap imported styles such as the basic, aniline and para are highly competitive, and the Indian industry will do well to strike new lines as well, and explore the vast possibilities of modern dyes and designs. To give one outstanding example, the bright and fast variamine blue whose unique versatility allows it to be direct-printed, discharged or resisted in various colours with equal ease, has been extensively exploited in the West, but totally neglected in India, where it offers a virgin field to be exploited in the right sort of designs. Among other styles which can be profitably introduced here may be mentioned, multi-coloured vat discharges on Azoic, and resists under medium Indigosol grounds ; glistening metallic prints on dark dyed grounds, etc. In recent times the scope of application of the fast azoic and vat dyes has been considerably widened by such preparations of them as the Rapids and Indigosols. Applied and developed under different conditions from the parent dyes, they enable more varied print effects to be produced than was hitherto possible.

Printed Saris

Another vast field is printed *saris* in modern pleasing designs and colourings, with spectacular side and cross-borders, so beloved of Indian ladies, but obtainable only in crude local block prints. This would, however, require special *sari* printing machines, with the so-called "dancing rollers" and skilled specialist *sari* printers to run them. Apart from the costly machines, the *sari* printers' bugbear is the large investment in print rollers, because the filling, side borders, and cross-borders require separate sets of rollers for each colour in the same design. However, in view of the high return, the whole question is entirely one of enterprise and imagination. It is odd that while such machines were invented abroad to satisfy Indian markets, the few machines that have been installed in India are wasted on the production of ordinary cheap prints.

Among other fields may be mentioned: printed shirtings, coatings, handkerchiefs (special machines), furnishing fabrics, etc., in appropriate designs and colourings. The scope of multi-coloured prints now being produced here, can also be substantially widened if more attention is paid to novelty and imagination in designing, balance in colouring, range of shades, the appropriate tinting of white ground prints, etc. One cannot too strongly stress the role that artists and designers can play, alongside technicians, industrialists, and merchants in the future growth of the industry.

For proper growth of calico printing in India, a local industry for engraving and repairing of copper printing rollers is absolutely essential in each manufacturing centre. Bigger printing establishments may advantageously set up their own engraving plants, if they can keep them well occupied with their own work, supplemented with outside jobs when necessary.

Dyes (and chemicals) are a substantial item in the cost of printing, in which the cost of labour is of minor significance unlike textile manufacturing. Therefore, one cannot overlook the need of a national dyestuff industry in due course, producing at least the staple dyes most used in India for dyeing and printing, if we have to meet possible foreign competition on more level terms. One must have noted how Japan benefited by its own dyestuff and chemical industry, made a sensational progress in calico printing, and became a menace to the U.K., the pioneers of machine printing and of practically all export styles. Eventually the manufacture of printing machinery and auxiliaries of satisfactory quality in India can complete the picture.

The Future of the Industry

The Indian textile industry has so developed that the cloth is manufactured and printed in the same mills. Calico printing is a specialized industry, and in the West it is separately carried out by specialist printers. They either purchase their own requirements of cloth from weavers or warehouses, print and sell on their own account ; or, as "commission printers," they print the cloth for a merchant (called a "converter") on his account on payment of agreed printing charges. In either case, the printers carry out their specialized trade of printing only, and not of manufacturing the required cloth. In India, while commission printing has grown during the war mostly in small factories with locally fabricated plant, the spinning and weaving mills who have put up a few printing machines, view it as a side line providing a regular outlet for some of their looms, or a device to dispose of cheap cloths at better profit after printing. Each structure of industry has its own advantages and disadvantages, and it is for the industry to decide what is best for its growth. A compact manufacturing and printing establishment, weaving solely and specially for the express purpose of printing, would seem to be a good compromise.

In a land of colour and pageantry such as India, with its rising population, and possibilities of rising standards of life as envisaged by economic planners, the calico printing industry, among others, has bright prospects. Some parts of India, such as the southern peninsula, have not by force of tradition, yet taken to printed apparel, preferring dyed woven material instead. They are waiting to be made print-minded, and there are good prospects of export to the near Pacific, African and Middle East markets.

The Australian Textile Industry in Wartime

BY ALEX J. BENNETT

(Specially Contributed)

FOLLOWING upon our recent article in this *Journal* under the above heading, we would like to strongly emphasize that during the present war the industrial conditions and circumstances are exactly reverse to the conditions obtaining during the 1914-18 war.

Although during 1914-18 woollen and clothing were amongst our most important secondary industries, they were not self-contained. Practically all woollen yarn for socks, cardigan jackets, and underclothing had to be imported for there was only one firm in Australia equipped with machinery capable of all stages of manufacture. The clothing trade also had to import all accessories. Expansion of industry then was handicapped by the impossibility of obtaining necessary machinery from abroad—as an instance, a firm at Geelong awaiting plant had three consecutive consignments of power looms sent to the bottom of the ocean by enemy action. The civil population in the last war experienced continuous and serious shortages of essential commodities and so the Commonwealth was quite unable to make any important contributions to Empire war efforts.

Present Position

To-day the picture is entirely changed, and despite the man-power shortage Australia is able not only to equip and clothe her own immediate and neighbouring fighting and civilian services but also to export textiles to other parts of the Empire. Under present war-time stress Australia has gone into production of almost every conceivable type of textile fabric, including cotton, linen, silk, carpet, felt, and composite materials not previously manufactured within the Commonwealth.

Although Australia is generally considered to be a primary producing country, her factories now employ 600,000 hands and from their annual output valued at £500 millions supply about 85 per cent. of the manufactured products consumed by the population of the Commonwealth, and except in a few instances all have been developed for production of normal peace-time requirements.

Speaking primarily of textiles, the advance has been most marked by the erection of immense self-contained woollen and worsted, silk, and cotton piecegoods factories, whilst those existing plants have been in most cases considerably enlarged: bringing up the production of these goods manufactured to three times greater than in pre-war years.

Latest Statistics

Here are the latest statistics regarding the textile industry:—The number of textile and textile goods factories in the Commonwealth total 705. The value of output of these factories total £44,782,623. The value of production of these factories is no less than £17,936,299. Because wool is her chief raw material (just as cotton is India's chief fibre of industry) Australia must fundamentally remain a woollen and worsted manufacturing country—however, there has been considerable development in cotton piecegoods manufacture.

. Since the outbreak of war and the sudden cessation of Japanese imports of cotton goods, large cotton mills have been erected in Sydney, Melbourne, and Adelaide,—over the past two or three years. Spindles have increased from 73,000 to nearly 200,000 and most of these are operating double shift.

One company operating in Melbourne and Sydney has increased its capital from £116,000 to £660,000: another company with mills in three States has a paid-up capital of £726,000—four other companies have paid-up capital of £520,000. A new company in South Australia for manufacture of sheetings, pillow cloths, twills and dyed piece cloths has a capital of £600,000—it will directly *replace those commodities which formerly* came from Japan.

Irrigation plants have been installed by the Queensland Government to grow more cotton which at present is totally inadequate for local consumption. In 1940 50,000 bales of 500 lbs. of fibre were used, but the present requirements are about double that figure.

Rayon and Synthetic Fibres

Efforts to establish the rayon industry in Australia have not received much encouragement, and permission on behalf of promoters of this industry to import necessary machinery from America was recently refused by the Customs Department.

The synthetic fibre industry would hardly be countenanced by the Commonwealth Government, as the wool industry particularly at the moment is strongly up in arms against what it considers its most potential competitor. The Australian Wool Board is now pressing for legislation to label contents of all apparel displayed for sale. There is at the moment in Australia a general public outcry that the present single-wefted fabrics, or standard cloths, are so inferior that the good name of Australian cloths is being jeopardized in the public eye, also that synthetic fibred cloths are making headway as a result. Following an inquiry by the Tariff Board, manufacturers are to be allowed to make a certain percentage of better class fabrics. It is also resolved that repatriated service men are to receive better quality suits than have been issued hitherto. In face of the better war position on all fronts the tendency here is to revert to more normal business conditions in this regard.

The flax growing industry has been greatly stimulated by Government since all former supplies were cut off, the linen and cordage industries have also made great strides. The silk weaving industry, chiefly for parachute silk fabric, has been successfully established in Melbourne. There are, of course, an endless variety of textile sidelines such as glove manufacture, webbing, braids, elastics and laces now being manufactured *for the first time in Australia—all brought to* fruition as a result of war-time needs.

It is indeed a characteristic of the Australian, born of pioneering forefathers, to enter into new spheres of industry with the same courage and determination which has marked her fighting forces in the jungle and in the desert.

Projected New Mill

We could give no better instance of this to our fellow textilists of India and elsewhere than to describe the founding and establishing of the Returned Soldiers Mill at Geelong—it is a similar story which could be told in regard to almost every other textile mill in the Commonwealth.

The story of the founding of this mill will be told in our next article.

Note.—As we are about to post this article, word has come through from Canberra of the Government's decision to establish at Newcastle a textile manufacturing concern on a major scale. The Federal Government has agreed to lease to Tapitex Pty. Ltd., a portion of a large munition factory for conversion to a textile factory. Mr. Curtin, the Australian Prime Minister, said that the textile products to be made here were formerly imported from abroad—much of them from Japan—and the enterprise meant actually the establishment of a new industry in Australia which, when fully developed, should employ some 2,500 hands. Ultimately the capital involved would amount to £1,500,000." As the manufacture of rayon and artificial silk will form an important part of the output from this mill it would appear that the opposition to synthetic-fibred fabric manufacture in Australia (as referred to above) has been overcome. It must be remembered that there are vast resources of soft pine woods available here as raw material for the synthetic textile industry and henceforth Australia may manufacture her own artificial silks and fabrics for the first time under the impetus of war.

Eighty Fellowships in Science

I.C.I.'s Gift to Nine Universities

THE directors of Imperial Chemical Industries have offered to provide at nine universities in Great Britain 80 Fellowships to be held by senior workers in certain sciences. The scheme is announced to operate for an initial period of seven years. The Fellowships will be of the average value of £600 per annum, though the universities will have power to determine the emolument for each particular appointment. The Directors of I.C.I. have described on broad lines the subjects in which the Fellowships are to be held and the administration of the scheme rests wholly with the universities, which will select and appoint the Fellows, subject only to such conditions as to duties and tenure as the universities themselves impose.

The purpose of the Directors in instituting this scheme is to strengthen the general provision in the British universities for scientific teaching and research. The Directors believe that academic and industrial research are interdependent and complementary and that substantial advances in industry cannot be looked for without corresponding advances in academic science.

In their view it is important that the immediate objective should be the strengthening of university scientific departments in whatever way each university thinks to be best. No conditions whatever are attached by the Directors to the tenure of these Fellowships. The Fellows will be members of the university staffs and will be concerned only with the duties laid upon them by the universities. Their primary work will lie in research. But they must also take some part in university teaching. It is intended not to relieve the universities from the cost of maintaining any part of their normal work but to enable them to add to what they already do.

The nine universities to which this offer has been made comprise the larger metropolitan universities and those which have a close geographical relation to the main centres of the company's production. Twelve Fellowships each have been offered to the Universities of Oxford, Cambridge, and London, eight each to the Universities of Glasgow, Edinburgh, Manchester, Birmingham, and Liverpool, and four to the University of Durham.

The Directors believe that a rational policy of this character, together with a wise selection of men both as regards capabilities and tenure of office will lead to the emergence of a body of men capable of taking high academic or industrial positions, thereby advancing academic and industrial research.

Lord McGowan, in a letter to chancellors of universities, says: " Nearly three generations of experience of the administration and conduct of research have convinced us that academic and industrial research are interdependent and complementary and that it is useless to expect substantial advances in industry without corresponding advances in academic science . . . It is reasonable to assume that if our scheme works well others may feel disposed to make similar subventions. Parenthetically, we have taken it for granted that appointments will be made without any discrimination as regards race or nationality."

—Manchester Guardian.

Mango Nut Powder for Sizing Yarn

MR. S. G. CHOWDHARY, B.Sc. (Ind. Chem.), acting Manager, Moon Mills Ltd., Bombay, writes:—

At this critical juncture when there is acute shortage of foodstuff all over the country, the availability of starches for sizing purposes has become a serious problem. Introduction of tamarind seed powder has been a great help in meeting the situation for some time past. But, according to the latest information, even this substance will not be available for the purpose to the required extent, because it is now being used as food material.

May I suggest through the columns of your esteemed periodical that researches should be made at the various technological institutes to see if the powder of mango nut could be used for sizing cotton and jute yarn in place of starches. As a student of chemistry, I feel it can successfully be used for the purpose.

Hospital For Mill-workers

Dr. Alagappa Chettiar's Gift

THE foundation-stone laying ceremony of the mill hospital attached to the Cochin Textiles, Pudukad, was performed by Sir George Boag, Dewan of Cochin State, on 27th October 1944. Dr. Rm. Alagappa Chettiar is constructing this hospital for the benefit of the labourers of the Cochin Textiles and it is located in the spacious grounds in front of the mills and will have 12 beds. It is expected to be ready for use early in the new year.

Dr. Alagappa Chettiar read the messages received wishing the function all success, including one from H. H. the Maharaja of Cochin.

The Hon'ble Mr. T. K. Nayar appreciated the noble ideals of Dr. Alagappa Chettiar of distributing wealth to the poor and hoped his example would be emulated by others in Cochin State.

Dr. Alagappa Chettiar then announced that H. H. the Maharaja of Cochin had permitted the association of his name with the institution, which would be named the "H. H. Maharaja Ravi Varma Cochin Textiles Hospital." Sir George then unveiled a portrait of the Maharaja.

Addressing the gathering, Sir George Boag said that Dr. Alagappa Chettiar had already given many tokens of his munificent generosity in the State. They were at the present moment beginning to put into operation a technological course in the Maharaja's College at Ernakulam, which was due to his generosity. Dr. Chettiar, in his relations with his labourers, was setting an example which all employers of labour within the State and throughout the country would do well to follow. Business after all was not merely a money-making affair. It was a human relationship. An ideal employer of labour, both a small as well as a large employer, did not regard men, women and children who worked for him as so many parts of the machinery of his factory. He regarded them as human beings with human feelings and human needs. The necessity of adequate medical assistance at hand in mills like the Cochin Textiles, especially at the present time, when men, women and children did not always enjoy perfect health, had been fully realized by Dr. Chettiar and it should be much appreciated that he had launched on this scheme of providing this very useful amenity for them.

Group photograph taken on the occasion. Sir George Boag is seen garlanded in the middle with Dr. Alagappa Chettiar on his right and the Bishop of Trichur on his left.

Bombay Industrial Court at Work

Digest of Important Decisions in 1944

BY PRABHUDAS B. PATWARI, B.A., LL.B.

(*Specially Contributed*)

1. *Employee Defined.*—There is a distinction between the expressions "employees of the textile mills" and "persons employed in connection with the textile industry." The former obviously means persons actually employed in the cotton textile industry while in the latter the connection between the textile industry and those persons is not necessarily so close. (App. No. 108 of 1943.)

2. *S.* 28: *Sch.* II (i): *Closure of a whole shift without Notice. Famous Calico Mill case.*—In a third shift functioning for some months in the years 1941 to 1943 but which was purely a temporary affair, a notice of one month for its discontinuance under Standing Order No. 9 is not necessary and, therefore, a closure of the third shift did not involve any reduction of a permanent or semi-permanent character in the number of employees. An operative by finishing two months' probationary period, or even a longer term, does not become entitled automatically to the status of a permanent operative. (App. No. 163/1943.)

3. *Strike.*—It is true that some out of many workers might not be in favour of a strike but the question has to be determined not with reference to what their view of the strike was but with reference of their actual conduct; otherwise every one of the workers could come and say that he himself was against the strike but that he refrained from coming to work because other persons were striking work. (App. No. 148/43.)

4. Where the whole mill had to be closed on account of stoppage of work by the employees it was contended that there was no concerted action and, therefore, there was no illegal strike. The Court held that it is impossible to believe that each one of the workers would stop working one after the other without concerted action on their part. Admittedly the stoppage of work was meant as a protest and that there could not have been almost simultaneous stoppage of work unless the workers resolved through their leader that they must stop work. (App. No. 228/43.)

5. *S.* 73 (2): *S.* 77 (2): *Contracting out.*—If the employees enter into a specific agreement with the mills, contrary to the Award, the Court can take no notice of it as contracting out of a settlement or an Award is not allowed under section 77 (2). The section refers only to a contracting out of a registered agreement. Award cannot be changed or modified even by the mutual consent of the parties thereto. (App. No. 121/1943.)

6. *Sch. II* (9): "*Ex-gratia*" *Payment not Wages.*—The word "wages" imports the idea of legal liability on the part of the employer to pay a definite and well settled consideration arising from a legal relationship of employer and employee. But *ex-gratia* payment to a few of the workers in addition to the specified rates of wages having no relationship whatsoever either with the amount of work done or efficiency or good attendance and which may be withheld at the option of the employer cannot be regarded as wages. (App. No. 158/43.)

7. *Sukhdai and Extra Bonus.*—The staff of the mill company is not entitled to these things as a matter of right. It depends entirely on the discretion and goodwill of the management. (App. No. 162/1943.)

8. "*Force Majeure.*"—The words *force majeure* are not defined in the B.I.D. Act and must be given its ordinary dictionary meaning which is "irresistible compulsion." The word does not necessarily refer to an act of God but to all circumstances which are beyond the control of the party which claims the protection of *force majeure* clause. "The term is used with reference to all circumstances independent of the will of man and which it is not in his power to control; war, inundations, epidemics, strikes, embargo and even a breakdown of machinery through accident were deemed *force majeure* (1920) 2 K.B. 714." In App. No. (16/44) it was held that shortage of chemicals due to war conditions and Government control was held sufficient

justification for temporary stoppage of work. Reduction in the number of employees owing to circumstances arising on account of war and beyond their control must be held to be due to *force majeure*. It requires no notice of change. (App. No. 153/1943.)

9. *Assistant Weaving Master* cannot take advantage of the Standing Orders for Operatives as he is not an operative. (App. No. 199/43.)

10. *Permanent Operative.*—Though a worker may be in the service of the mills for three months he thereby does not become a permanent worker. (App. No. 157/43.)

11. If the employee could not properly fall within the scope of the definition of other operatives as defined in S.O. No. 3, he cannot be regarded as permanent operative unless he satisfies the conditions laid down in the definition of a permanent operative. (App. 157/43.)

12. *Discharge Notice.*—The services of an employee who is not really a permanent one can be dispensed with by the mills without any notice. So a *badli* worker can be discharged without notice (157/43). Even for a permanent operative this order does not seem to contemplate a written notice except in cases where the operatives desire a written statement of reasons for their discharge but S.O. No. 25 requires a written order in the form prescribed when a permanent operative is discharged. (App. No. 113 to 116 of 1943.)

13. *Reason.*—As to what constitutes " reason " within the meaning of S.O. No. 19 (*a*) has not been defined in the Standing Order. An operative may be discharged for any reasons even other than those mentioned in S.O. No. 21. Whether the reason is sufficient or insufficient is not a matter for the Court to decide. (App. No. 165 of 1943.)

14. It is not open to the Court to sit in appeal over the decision of the manager of the mill and go into the question whether the reason assigned by him for terminating the employment of the operative is a sufficient reason or a reason at all under S.O. No. 21. (App. No. 146/43; App. No. 8/44.)

15 and 16. *Service of Notice.*—If for any reason the employee makes it impossible for the mills to serve a notice on him personally, the notice should be sent on to the Labour Officer who is a representative of employees (App. No. 72/43) or there should be an endorsement to that effect on the notice in the natural course of things. (App. No. 192/1943.)

17. *Discharge and Dismissal.*—It is not true that wherever there is misconduct on the part of the employee, the mills must only dismiss him and not discharge him. It is open to the mills either to discharge him or dismiss him as laid down in S.O. No. 19 or S.O. No. 22 respectively. (App. No. 93/1943.)

18. Collection of union subscription by a representative union from the members of the union within the mill premises cannot thereby automatically be a purpose sanctioned by the manager within the meaning of this Standing Order except in Ahmedabad. (App. No. 93/1943.)

19. *Negligence of Work.*—Where an operative was suspended for one day for negligence of work it was held that mere negligence of work is not a misconduct under S.O. No. 21. It says that habitual negligence or neglect of work is misconduct. It is hardly necessary to point out that negligence is one thing, whereas habitual negligence is quite a different thing. In these circumstances, the operative not having been charged with any misconduct, he cannot be found guilty of any such misconduct and cannot be subjected to a suspension on that account. (App. No. 205 of 1943.)

20. *Dismissal.*—As in this order the word " operative " is used without any qualification, the provisions of the order would apply to all operatives whether they be permanent or temporary. Therefore, a temporary worker also cannot be dismissed without any notice, etc. (App. No. 122/43.)

21. *Discretion of Management.*—The Industrial Court is not a court of appeal against the orders passed by the managers dismissing their employees after holding an inquiry as contemplated by S.O. No. 22 and it is not open to the Court to consider whether the circumstances of the case justified the passing of a particular order. (App. No. 142/1943.)

22. Manager's signature on the dismissal slip should not be a mere mechanical act. The manager must apply his own mind to the merits of the case before awarding punishment. (App. No. 87/1943.)

Cloth and Yarn Prices Reduced

Textile Control Board Chairman's Announcement

A SCHEME for the distribution of cloth on an all-India basis, which would reduce to the minimum, if not altogether eliminate, the black market in the cloth trade, has been agreed upon after prolonged discussions between representatives of the Government of India and members of the Industry's and Distribution Committee of the Textile Control Board. It was outlined by Mr. K. M. D. Thackersey, Chairman of the Textile Control Board, at the meeting of the Board held in Bombay on Thursday, the 25th January. The following are extracts from Mr. Thackersey's speech :—

" At the meeting held in October last, I had indicated to you that the Industry's Committee had decided to revise the schedule for the fixation of ceiling prices for all types of cloth manufactured by mills on a more rational basis, removing the various anomalies which had then become apparent by the application of the original schedule. The ceiling prices for all qualities at present manufactured by mills in India on this revised basis have now been re-calculated and are being sent out to the mills with instructions that they will form the basic prices to be stamped on all such cloth produced by them on and after 1st February 1945. The Industry's Committee have since given further consideration to these levels of prices, and I am glad to be able to inform you that they have recommended that these new basic prices should bear a further reduction of 5 per cent. with effect from 1st February 1945. This reduction, broadly speaking, is to be applied to all cloth manufactured with warp counts 50s and under. In the case of yarn, the ex-mill ceiling prices of counts 16s and over (and upto 45s) manufactured from Indian cotton are to be reduced with effect from the same date by one anna in the rupee.

" No reduction has been recommended in the case of superfine qualities of cloth and finer counts of yarn owing to a substantial increase in the prices of Egyptian cotton and also for the reason that an incentive has been left for mills generally to increase their production as far as practicable with a view to meeting the present acute shortage of such materials. The Export Committee have further recommended that the quota of fine cloth of 48s warp and over at present exported out of India should be substantially reduced. It is hoped that these measures will go a long way in ensuring fair supplies of available fine cloth to the consumers of this country.

Difficult Coal Situation

" During the period under review, production has run at a fairly high level despite the increasing difficulty of maintaining supplies of coal to producing centres. The situation has considerably worsened during the last month when due to cold weather the coal consumption in all mills increased very greatly ; whereas about 160,000 tons of reasonable quality coal is barely sufficient to keep all mills in production in a normal month, at least 190,000 tons of reasonable quality coal per month is required to keep mills in production during the cold months of December to February. Last year mills were able during these critical months to draw considerably on their stocks, but this year the stock level has fallen so low that this was not practicable. The loss of production during the month of December last is in the neighbourhood of 25 million yards which is the highest on record. The position in January this year is going to be the same. I do realize that the Hon'ble Sir Akbar and Mr. Patel are doing their very best to see that the textile industry gets the fullest possible share. In spite of their efforts, however, the position for one reason or another remains obscure. I do not think it will be out of place here for me to make a few observations in regard to the significance of coal shortage on the textile industry and other industries. In the first place, the country is experiencing an acute shortage of consumer goods including cloth. If proper facilities are not provided to feed markets with these goods, in the face of inflation which is moving at a quick pace, there is likely to occur a major economic crisis in the country. Secondly, the closure of mills would mean dimunition of demand for raw materials like cotton which in turn is bound to affect the interests of the farmers to help whom Government itself is buying certain amount of cotton in the open market. Last but not least is the concern of the workers regarding the unemployment that will be thrust on them for no fault of theirs owing to lack of coal supplies. The situation is undoubtedly grave, and unless urgent and drastic measures are taken, I am afraid all our efforts to ensure satisfactory working of control will be of no avail. I, therefore, submit in all sincerity to Government that every effort should be made to rush on a high priority basis immediate supplies to mills either by stopping exports of coal, if they are still continuing, or by procuring more coal by any possible means.

New Scheme of Distribution

"In my last quarterly review, I had given you a gist of the distribution scheme to be introduced in Bombay City with the object of ensuring an adequate distribution of cloth to the various surplus and deficit zones as defined under the Cotton Cloth Movement (Control) Order commensurate with the population of those zones. Although the scheme worked fairly satisfactorily in Bombay City for some time under the able guidance of your Bombay Cloth Distribution Panel, the fruits of its labours were, however, imperilled owing to the menacing growth of black market activities. You are already aware of the warning given early in December by the Hon'ble Sir Akbar to the dealers that if they do not set their business in order within the next few days Government will not hesitate to take steps to enforce control, if necessary, even by assuming complete control over distribution of cloth direct from the mills. At the same time, in an effort to eradicate black market in Bombay which is one of the major producing centres for cloth, on the advice of the Bombay Cloth Distribution Panel, the Textile Commissioner has had to introduce about the middle of December last a purely temporary and emergency scheme, brief details of which are being circulated to you separately. As far as the Ahmedabad producing centre is concerned, the Ahmedabad *Mahajans* assumed full control over quota holders and enforced distribution to various Provincial Centres at controlled rates on the basis of their transactions in the basic period 1940-42. Punitive action has been taken against certain defaulters for contravention of the control measures.

"These emergency steps, I must admit—and this statement will, I am sure, be corroborated by the Textile Commissioner and those who have had an opportunity to study the situation—have had a salutary effect and have very largely tended to remove black market practices in Bombay. Reports from other producing and consuming centres, however, indicated that black marketing and profiteering were very rampant. The main reason for this state of affairs appeared to be a lack of a central distribution scheme and distribution arrangements within each Province co-ordinated to and falling in line with such central distribution scheme. I am glad to be able to tell you that following my protracted discussions with Government, the Distribution Committee have just endorsed the broad outlines which will govern the detailed scheme of central distribution of cloth which will hereafter be worked out and put into operation at the earliest possible moment. This central scheme has as its main objective the retention of the normal trade channels on the basis of their 1940-41-42 transactions. The quota holders in producing centres would group themselves into a small number of groups, each under a leader. This leader or his deputy or deputies duly constituted will be responsible to the Textile Commissioner for delivery of cloth ex quota holder's godown in the quantities and at the prices duly laid down only to the authorized wholesalers' groups in the provincial or district consuming centres.

"The cloth will leave the producing centre at not more than ex-mill plus 3 per cent. ex-godown, commission agent's remuneration, if any, not exceeding half per cent. being payable by the buyer. The scheme also contemplates that special steps shall be taken in regard to fine cloth because of the need to concentrate its retail distribution in urban areas with as few intermediaries as possible between the mills and the consumer and without greatly upsetting the existing channels of trade. A detailed scheme on the above lines, as soon as it is drafted and finalized, will be circulated to all members of the Board, and Provincial and State textile control authorities will be directed to ensure that the distribution arrangements within each of their territories are co-ordinated and are in exact accord with those in the central scheme. I have no doubt in my own mind that when this central scheme of distribution with the co-ordinated machinery in the various provincial and district centres is introduced black markets in cloth will by and large be things of the past."

Official Arrangements for Seizing Time-barred Stocks

Profiteering and black market trading in cloth and yarn were recently reported to have again assumed alarming proportions in Bombay and the textile control authorities have been obliged to ginger up measures against the anti-social elements.

The Provincial Textile Control Department of the Government of Bombay has taken severe action against several prominent cloth quota holders who have been called upon to show cause why their licences should not be cancelled. The control authorities are also investigating several cases of malpractices and dishonest stamping of cloth prices by manufacturers.

Meanwhile, the Province-wide Government organization for the distribution of cloth at controlled prices through approved shops has made good progress. Over 1,000 shops have already been opened in certain big centres and efforts are being made to meet the requirements of the consumers in the remotest parts. It is expected that the Government will be able to provide at least one cloth shop for a population of 6,000.

Arrangements for the stamping and price fixing of imported cloth and other fabrics which are arriving in Bombay on an increasing scale and the seizing of time-barred cloth have been completed by the Provincial Textile Control Department of the Government of Bombay. since Monday the 8th instant, inspectors of the department, assisted by the police, have launched a city-wide hunt for time-barred cloth—cloth that has remained undisposed of within the time limit fixed by the Textile Commissioner. In order to enable simultaneous action to be taken, the city has been divided into 19 zones, with a squad of inspectors and staff for each of them. It is proposed to concentrate first on the big wholesale and retail dealers and tailoring establishments, which also run a retail service. So far nearly 2,00,000 yards of time-barred cloth have been seized.

Every trader with whom time-barred cloth is found is liable to arrest and prosecution under the Defence of India Rules for breach of the Textile Commissioner's order. At the same time, time-barred stocks will be seized and kept in Government godowns until the disposal of the case. The goods will be confiscated, or otherwise dealt with, according to the court's orders.

Import Price Committee

An Import Price Committee has been appointed to assist the Provincial Textile Controller in the fixing of prices of imported cloth. The Provincial Textile Controller, Bombay, is the Chairman, and the members are Messrs. A. Sotiriadi, W. R. O'Vrien, Chimanlal B. Parikh, Gordhandas G. Morarji, and Purshotam Mulji Kapadia. The Textile Commissioner has already announced the general principles of price fixing, but discretion has been given to the Provincial Controller to make departures wherever necessary. Under this plan, every piece of cloth landed in the port will have to be notified to the Provincial Textile Controller, who will issue a certificate after the cloth has been price-stamped and TCB marked. The stamps will indicate the port and date of landing, the importer's price and the dealer's price.

The Government of Bombay has appointed the Provincial Textile Controller, Bombay, as " Controller " for Bombay Province in respect of the Government of India's notification fixing* the maximum wholesale and retail prices of cloth and yarn imported from outside India.

A scheme for the distribution of yarn to hand and power-loom weavers, whose trade has been almost brought to a standstill as a result of yarn shortage, has been prepared and put into operation at Ahmedabad by the Provincial Textile Controller, Mr. J. K. Thakore. Under this scheme, yarn quota holders are required to place at the disposal of the Provincial Textile Controller all their stocks and they will be free to sell directly only such of the stocks as are not required by the Controller.

The scheme was explained the 6th instant to members of the Yarn Dealers' Association and the Yarn Exchange in Bombay by Mr. Thakore. While pointing out certain drawbacks in the scheme, the majority of those present expressed their readiness to co-operate with the Government plan to ensure supply of the available stock of yarn to power and handloom weavers who were facing ruin.

The Textile Control Department has completed a census of the hand and power-looms in Bhiwandi, Malegaon and Surat and ascertained the extent of their yarn requirements. A similar census was undertaken in Bombay, and the Provincial Government have since decided to take over the entire distribution of cotton yarn in the province.

Textile Processors' Association (India) Bombay

" In order to mitigate the difficulties felt by the textile processing industry in Bombay due to the recent enactment of the amendment to the Textile Control Orders, an arrangement has been arrived at between the Textile Commissioner, Bombay, and the Textile Processors' Association (India) that an agreed quota for processing all cloth would be granted to the Association for redistributing the same among its members on the basis of their previous operation.

" This system, it is trusted, will work beneficial to all interests concerned and would also help in the elimination of the black marketing of cloth. The Textile Processors' Association (India) have thus undertaken a very great responsibility and they are exercising all effective methods of controls for the elimination of black market. They would not allow any printing of *kutcha* colours and half bleaching of cloth by their members."

CONTROL NOTES AND NEWS

Exemption for Speciality Cloths

The Textile Commissioner to the Government of India has decided to exempt certain speciality cloth from the operation of his notification of 16th December 1944, requiring quota holders in the city and suburbs of Bombay not to sell or dispose of their stocks except under certain specified conditions. Such speciality cloth includes cloth texmarked and marked " for export," tapestry, filter cloth, book-binding cloth, tarpaulins, emery cloth, waterproof cloth, double texture proof cloth, single layer synthetic proof cloth and imitation leather cloth.

Fine Cloth Sales : Returns to be Submitted

The Textile Commissioner to the Government of India has, by a notification published in the *Gazette of India* under powers conferred on him by Clause 18(A) of the Cotton Cloth and Yarn (Control) Order, 1943, directed all the manufacturers in the country to submit to him on or before the 15th day of every month commencing from December 1944, a return of sales of fine cloth made by him in the preceding month, giving the details of the name of the buyer with his address and the total quantity of fine cloth in terms of bales delivered to him against the quota during the preceding month. The notification explains that " fine cloth " means cloth in which the count of the warp yarn is 36s and finer whether it is single or folded. Failure to submit these returns is an offence under the Defence of India Rules.

Correct Marking of Prices

Under the Cotton Cloth and Yarn (Control) Order, 1943, the manufacturers are required to mark on the cloth and yarn produced by them the maximum ex-mill and retail prices prescribed by the Textile Commissioner. The duty to mark the prices correctly initially rests on the manufacturers, and the Textile Commissioner desires to impress upon them the desirability of providing scrutiny of the markings at the time of packing so as to prevent any incorrectly marked cloth or yarn being packed. The dealers should also ascertain, by reference to the notification on the subject, that the markings made on the cloth which they have in their possession, and which they may hereafter acquire, are correct. In case of doubt as to the correctness of the markings on any such cloth and yarn, they should at once report the matter to the Provincial Cloth Control Officer for guidance and should not dispose of the cloth or yarn unless authorized by him so to do. This is necessary in the dealers' own interest because a dealer commits an offence punishable under the Defence of India Rules if he sells cloth or yarn at a price in excess of that prescribed by the Order despite the fact that the price may be in accordance with the markings.

Disposal of Mill-packed Bales

The Textile Commissioner to the Government of India desires to inform all quota holders in the city and suburbs of Bombay that with respect to the 20 per cent. of the stocks that they are permitted to sell in unbroken mill-packed bales to dealers in Bombay, they must do so only after obtaining from the purchaser a declaration in writing that he is a Bombay Government licensed cloth dealer and he is neither a retailer nor a quota holder. Those quota holders whose total quota per month from all mills does not exceed 8 bales, are permitted to dispose of all such bales to any Bombay Government licensed dealer other than a quota holder or a retailer.

---

* See the *Indian Textile Journal*, November 1944, p. 119.

Export Cess Becomes Leviable Irrespective of Date of Contract

Under clause 4 of the Cotton Textiles Fund Ordinance cotton cloth and yarn contracted for export prior to the date of the Ordinance is exempt from the levy of the cess of 3 per cent. The Government of India have now decided that with effect from 1st February 1945, all cotton cloth and yarn exported out of India shall be liable to the cess irrespective of the date of the contract. They have also decided that in cases where no maximum ex-factory price has been fixed for the cloth or yarn meant for export, the 3 per cent. cess will be levied on the basis of the value of the cloth or yarn as declared in the shipping bill.

Cloth and Yarn (Export Control) Order Amended

The Cloth and Yarn (Export Control) Order, 1944 has been amended by a notification in the *Gazette of India* published on the 4th November 1944 providing that no person other than a manufacturer shall sell, offer to sell or store for sale to an exporter cloth or yarn meant for export except under and in accordance with a licence which will be issued by the Textile Commissioner on application in the prescribed form. This form has been published by the Export Trade Controller in his notice War No. 647, dated 3rd August 1944. A fee of Rs. 1,000 will be charged for each licence. It will be issued for a period of three months only in the first instance and may, at the discretion of the Textile Commissioner, be renewed and it is also liable to cancellation by the Textile Commissioner. It has been further laid down that a dealer holding such licence should not charge a price which exceeds the "standard price" by more than 10 per cent.

"Standard price" in regard to sale by manufacturer to exporter of cloth meant for export is the ruling ceiling ex-mill price notified by the Textile Commissioner under the Cotton Cloth and Yarn (Control) Order, 1943 applicable for the first month of the export quarter mentioned in the quota licence granted to the exporter by the Export Trade Controller.

In relation to sales by manufacturers to export wholesale licensees, "standard price" means the ex-factory price ruling on the date of issue of the export wholesale licence.

Manufacturers are entitled to charge "standard price" plus 7 per cent. thereof in either case. The same notification defines export price to mean the f.o.b. price so far as export by sea is concerned and the f.o.r. price in case of exports by land.

The notification also provides that no person shall export cloth or yarn intended for domestic consumption which has been texmarked and price-marked.

By another notification published in the *Gazette of India* dated 25th November 1944, the Central Government have further amended the Cloth and Yarn (Export Control) Order, 1944, introducing a new clause which lays down that no person shall, save in accordance with the general or special permission of the Textile Commissioner, sell or agree to sell for export cloth or yarn of any class or specification, other than cloth manufactured on handloom, the standard price whereof has not been specified under clause 10 of the Cotton Cloth and Yarn (Control) Order, 1943. By this notification the word "export" is now defined to mean taking out of British India by land, sea or air to any place outside India or to any tribal area or Indian State beyond the Western and Northern boundaries of the North-West Frontier Province.

On 8th November 1944, a Press Note was issued directing the attention of all persons possessing hosiery machines to the notification in the *Gazette of India* of 21st October, wherein the Government of India called upon all such persons to furnish details of the various types of hosiery knitting machines in their possession and of the types of hosiery needles required for these machines.

The information received by the Textile Commissioner up to the end of November is believed to be far from complete and it has been decided to keep the record open until 15th January 1945.

All persons possessing hosiery knitting machines should note that any arrangement made for the procurement and distribution of hosiery needles will be directly related to the records compiled from the information received and any person possessing hosiery machines who has not submitted the required details will not receive any assistance to obtain hosiery needles, hosiery machine parts, etc.

Marine War Risks

The Government of India have decided to afford free marine war risks cover on yarn transported by sea between Madras and/or Tuticorin and Calcutta from 16th December 1944, to 31st January 1945. Free marine war risks will be given provided the consignor or consignee has already insured the consignment against marine risks with an insurance company or underwriter and an application for free marine war risks accompanied by a certified copy of the marine risk policy is made to the Textile Commissioner, Bombay, prior to shipment.

* * *

The Government of India have decided to extend up to 31st January 1945, the existing arrangements whereby Government carries marine war risks on cotton piecegoods and yarn transported by sea between Bombay and Calcutta under the existing terms and conditions.

* * *

An amendment to the Textile Industry (Miscellaneous Articles) Control Order, 1943, published in the *Gazette of India*, dated 2nd December 1944, includes "the ordinary loom pickers of all types" among the articles controlled by that Order.

By a notification issued by the Textile Commissioner, published in the *Gazette* of the same date, it is provided that no person should sell ordinary loom pickers of all types required by the textile industry, (other than jute and hemp) at a price exceeding Rs. 210 per gross f.o.r. port of entry or town of manufacture in India with effect from 1st December 1944.

* * *

In order to facilitate distribution of cloth and yarn, the Textile Commissioner authorises mills to decline to entertain after 15th January 1945, any claim for eligibility to quota, made by any person. This does not debar delivery of quotas to persons already recognised as quota-holders.

DISTRIBUTION OF MILL-MADE CLOTH

Dealers' Suggestions to Government

To elicit the views of cloth dealers in the Province of Madras on the zonal scheme of distribution of mill-made cloth, Mr. S. Venkateswaran, Provincial Textile Commissioner, convened a conference of the representatives of the trade last month.

Mr. Venkateswaran, at the outset, explained to the conference, in detail, the scheme framed by the Textile Commissioner of India for the distribution of cloth by the division of India into surplus and deficit zones and said that the South Zone comprising the Madras Province, the South Indian States, Hyderabad, Coorg and the C. and M. Station, Bangalore, was a deficit area. Pointing out that under the new scheme the people would get only ten yards per head per annum (including handloom and local mill cloth) as against over 13 yards consumed in the pre-war period and that the Madras Government had been pressing strongly for increased quota, he said that, in addition to the internal production of mill-made and handloom cloth in the South Deficit Zone, the zone was now allowed to import 8,950 bales only a month, out of which the Madras Province's share was likely to be only 4,929 bales. The 8,950 bales would comprise 2,250 bales received from the Bombay mills, 2,250 bales from the Ahmedabad mills and the remaining 4,450 bales from other surplus areas like Sholapur, Baroda and Indore. The imports would include only about six per cent. of 'fine' cloth. Mr. Venkateswaran referred to the classification of dealers into A (sole importers), B (sub-wholesalers) and C (retailers) classes and mentioned that, out of the importers for the South Zone, Madras Province would have six. He invited those present at the conference to express their views on the classification of dealers, the fixation of the profit margins for each class (out of the 20 per cent. margin between the ex-mill and retail ceiling prices) and on the extent to which the different classes of dealers should be linked up to secure a planned distribution of the mill-cloth made available.

Recommendations to Textile Commissioner

The following recommendations were made by the Conference for the consideration of the Provincial Textile Commissioner : Only one representative, with headquarters at Bombay, should be appointed to deal with all matters concerned with the procurement of goods from the surplus areas. Out of the commission allowed to him, he should meet all his expenses and remunerate all his staff including the Assistants appointed by him at Sholapur and Ahmedabad with the approval of the Provincial Textile Commissioner. The present 10 per cent. margin of profit for retail dealers should be maintained. For any goods on which 2½ to 4 per cent. out of the total margin allowed for the trade, had to be paid in Bombay, Ahmedabad, etc., there was no place for 'B' class dealers in this Province. In respect of goods produced by mills in the South Deficit Zone, there must be 'B' class dealers (sub-wholesalers). In respect of all mill-quota goods coming into the Province, at ex-mill rates, the majority view was, there should be 'B' class dealers. In respect of such mill-quota goods received in the Province, an 'A' class dealer should sell to 'B' class dealers at a price not exceeding 6¼ per cent. over the ex-mill price, the freight charges from the mill to his place of business being borne by him. The 'B' class dealers should sell to the 'C' class dealers, that is, the retailers, at a price not exceeding the ex-mill price, plus ten per cent.

The Conference resolved that as regards the production of the local mills, i.e., the mills in the South Deficit Zone, the margins for 'A' and 'B' class dealers should be as indicated below : 'A' class dealers should not sell to 'B' class dealers at a price exceeding the ex-mill price plus 5 per cent. 'B' class dealers may have a margin of 5 per cent. and sell to 'C' class dealers at a price not exceeding the ex-mill price plus ten per cent. It was also decided that for proper distribution of cloth under the scheme, district quotas should be fixed not only for fine goods but also for other mill goods, provided a reasonable scheme was found feasible. The consensus of opinion at the conference was that, even if a district quota scheme was introduced only 'A' and 'B' class dealers should be linked up and that as far as possible the linking up of retailers to wholesalers of any category should be avoided. If unavoidable, such linking-up should be confined to retailers in a district with wholesalers who were not in the same district and who had to supply to the district to make up the district quota in all respects.

Madras Order

The transport of cloth from any place within the limits of Madras Province to any other place outside those limits is banned by the Madras Government.

Fighting Black-Marketing

With a view to fighting the flourishing black-market in cotton textiles, the C. P. and Berar Chamber of Commerce is considering, at the suggestion of the Provincial Government, a scheme to import cloth from the Bombay production centre.

The scheme envisages the formation of a syndicate of ten merchants under the ægis of the Chamber, who will deposit with the Government Rs. 50,000 each as security and appoint agents in Bombay to purchase and despatch cloth. The syndicate will appoint retailers from the *bona fide* merchants of 1942, the basic period, and will have to take a percentage of the standard cloth lying unsaleable with the Government.

It is proposed to extend the scheme to the distribution of the production of local mills also.

Weaving Shed Efficiency

BY M. M. TIWARI, L.T.M.

IN a mill the eyes of the management are always on weaving shed efficiency. They want the maximum output, but we must see to the other side of the problem. There are many factors which govern the efficiency of a weaving shed. They can be discussed as follows. A loom requires a man to run it. He should be a good weaver who can give us the best possible production. This man does not come from any institute or college. He is to be trained in the particular mill only where he is required. There are so many ways of training also which makes a good weaver. This training is thoroughly in the hands of the management who can turn out the best possible weaver if they like by introducing many sorts of labour training schemes. A labourer or a weaver should have good health, be a bit educated and possess knowledge to understand things.

The next thing a loom requires is a good beam to run. The beams which come from the sizing department are found with certain defects which are mainly responsible for low production. The beams are generally soft sized or brittle sized, in both the cases there are excessive warp breakages which stop the loom every now and then causing less production and less efficiency. When there is an entanglement of warp at the back of the sizing machine the back sizer generally cuts so many ends and those ends are found missing in the weaver's beam on the loom producing less and damaged cloth. So many defects are found in the warper's beam from the warping department. The warper so many times runs the machine without putting the full number of drop pins, thereby so many ends are found to be missing because the machine does not stop when the ends break. So many times numbers of cross ends are found in a beam due to the negligence of the warper.

Large knots found in a weaver's beam are solely from the winding department. These knots, when they pass through the heald eye, entangle and break, causing further entanglement of warp and unnecessary stoppage of loom.

Uneven and weak yarn is the cause, which comes from the spinning department.

The defects which come from winding, warping and sizing can be rectified only by strict supervision. There is no other remedy because this is nothing but the carelessness of the operatives.

The management should always try to use durable and the best possible loom sundries because they are solely responsible for good working. Suppose they use an inferior quality of shuttle, picks, buffer, picking band, checkstrap, and picking stick, then every time something or other will break, causing the loom to stop and allow the weaver to go to the stores or to the jobber for its replacement.

Sometimes the weft from the spinning department comes very bad, which breaks every now and then and stops the loom.

A good loom is also responsible for good efficiency. A loom when it is new gives the maximum efficiency and service. A certain life is possessed by every machinery; if care is not taken properly then it will always cause some trouble and affect the efficiency of the shed. So after an interval of certain years it must be overhauled. In working time it must be always cleaned and oiled properly.

The most necessary thing required is strict supervision. The Indian labourer is very fond of smoking *bidis* and chatting. No looms should be stopped unnecessarily for want of weavers. If a weaver goes out, his neighbour must run it and keep it running until he returns.

If the above things are maintained then there is no difficulty in getting good efficiency. They are the most common things but they are not attended to properly.

OUR PERSONAL COLUMN

New Year Honours.—The following, among others, have been awarded titles in the New Year Honours List :—

KNIGHTHOOD

The Hon'ble Mr. Justice Harsidhbhai Vajubhai Divatia, Puisne Judge of the High Court of Judicature at Bombay (President of Industrial Court, Bombay).

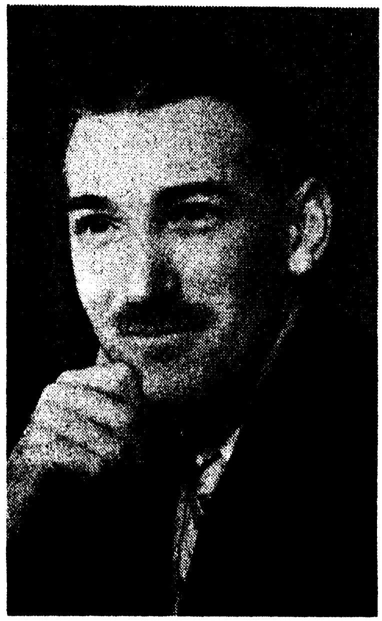
Mr. Robert William Targett, Director-General, Supply and Disposals, Department of Supply, Government of India.

Mr. Bomanji Jamshedji Wadia, Barrister-at-Law, Vice-Chancellor, University of Bombay.

Dewan Bahadur A. Lakshmanaswami Mudaliyar, Vice-Chancellor, University of Madras.

Mr. Jehangir Jivaji Ghandy, Agent, Messrs. Tata Iron and Steel Co., Ltd., Calcutta.

Sir James Doak, Kt., C.A., on whom a Knighthood has been conferred, is a Partner of Messrs. A. & F. Harvey, Managing Director of the Madura Mills Co., Ltd., Madura, and Chairman of the Board of Directors of the Pandyan Insurance Co., Ltd., and the Punalur Paper Mills Ltd. Born in 1904, he joined the firm of Messrs. A. & F. Harvey in 1928.



A well-known and prominent figure in the sphere of industry and commerce, Sir James has served on the Indian Central Cotton Committee and the Yarn Sub-Committee of the Cotton Textiles Panel and latterly on the Textile Control Board and its Committees. As Chairman of the Handloom Committee of the Textile Control Board, he has taken much interest in the setting up of the proposed All-India Handloom Board.

Progressive movements calculated to further the interests of public well-being in South India have found in Sir James a ready patron. As an employer of the largest private labour force in South India, Sir James is keenly interested in their welfare and housing conditions and has done a lot to improve them.

C.I.E.

Mr. D. C. Fairbairn, Secretary, Bengal Chamber of Commerce, Calcutta.

O.B.E.

Mr. P. C. Chaudhuri, I.C.S., Additional Chief Controller of Imports, New Delhi.

Mr. D. Mahta, Secretary, Indian Central Cotton Committee, Bombay.

M.B.E.

Mr. N. O'Hagan O'Neill, I.C.S., Under Secretary to Government of India, Department of Industries and Civil Supplies.

Mr. Mani H. Mehta, Joint Secretary, Bombay War Gifts Fund, and Partner of H. M. Mehta & Co., Bombay.

DEWAN BAHADUR

Mr. Krishna Rama Pai, Controller of Patents and Designs, Government of India, Calcutta.

RAO BAHADUR

Mr. K. M. S. Lakshmanier, Director, Madura Mills Co., Ltd., and President, Madura-Ramnad Chamber of Commerce, Madura.

Mr. R. Guruswamy Naidu, Managing Agent, Palani Andavar Mills Ltd., Udamalpet, Coimbatore District.

Mr. Deva Rao Shivram, Bangalore.

Sir Robert Menzies, Kt., O.B.E., V.D., C.A., Chairman and Managing Director, the British India Corporation Ltd., has been elected President of the Upper India Chamber of Commerce, Cawnpore, for 1945.

Mr. C. P. Bramble, of Messrs. Drennan & Co., has been elected President of the Bombay Chamber of Commerce for the year 1945-46.

Mr. Bramble has been connected with the Chamber for a number of years and was its President in 1940-41. He was recently elected President for the current year owing to the ill-health of Mr. A. L. Hutson. Mr. Bramble is a sitting member of the Bombay Legislative Assembly and is connected with a number of public bodies, including the European Association, Bombay Branch, of which he is chairman. He is also the Chairman of the National Service Advisory Committee, Bombay Area, and an Honorary Presidency Magistrate.

Mr. John Slater, Director of Messrs. W. H. Brady & Co., Ltd., has retired and left for England during the month, after a service with his firm in India of about 23 years. Before he came to this country, Mr. Slater was Assistant Manager at a mill in England and was also a lecturer in cotton weaving at the Burnley Technical College.

He joined the firm of W. H. Brady & Co., Ltd., Bombay, in 1921 as an Assistant in their textile machinery department, and was appointed a Director in 1932. Mr. Slater has travelled extensively in this country and is well known and popular with everyone in the cotton industry and he has been responsible to a considerable degree for the extension of the use of English textile machinery and of the Leesona system of high speed winding and warping in this country.

During the past two and a half years he has been a member of the Textile Control Board of the Government of India at Bombay.

We understand that Mr. Slater's retirement was due to reasons of health and we hope that with modern treatment and rest in his native country he will eventually be able to renew his connection with the textile industry of India in the development and progress of which he has been so closely interested.

Mr. Yusuf Sait, President of the Southern Indian Chamber of Commerce, has succeeded Dewan Bahadur Gopathi Narayanaswami Chettiar as Sheriff of Madras.

Mr. Dharma Vira, I. C. S., has been appointed as Deputy Secretary to the Government of India, Department of Industries and Civil Supplies.

Mr. R. H. Parker, Additional Controller-General of Civil Supplies, is to officiate as Controller-General of Civil Supplies and ex-officio Joint Secretary to the Government of India.

The services of **Mr. S. N. Mehta,** I.C.S., Deputy Controller-General of Civil Supplies, Bombay, have been placed at the disposal of the Government of India in the Commerce Department.

Mr. Geoffrey W. Tyson, C.I.E., has been elected a member of the Indian Legislative Assembly from the Bengal (European) constituency in place of Mr. C. C. Miller, resigned.

Mr. B. A. Kureshi will officiate in place of Mr. M. H. Mahmood, Director of Industries, the Punjab, who has been appointed Deputy Industrial Adviser to the Government of India.

Mr. R. A. Royston, Manager of the Elgin Mills (belonging to Messrs. Begg Sutherland & Co., Cawnpore) has been appointed Textile Commissioner for the U.P.

Khan Bahadur Iqbal Ahmed Khan, (at present Additional Commissioner, Agra Division) has been appointed Deputy Controller, Civil Supplies, U.P. and Bihar. The creation of the post, it is understood, is in pursuance of the Government of India's desire to effect a smooth working in the Civil Supplies Department and is intended to meet the increasing amount of work.

Lala Kailashpatji Singhania, Senior Director of J. K. Industries, has been unanimously elected Mayor of Cawnpore. *He is the youngest incumbent of the* post, being only 37 years of age.

Rao Saheb N. M. Sundram, Deputy Director of Industries and Supply, Assam, has now been deputed to Bombay as Deputy Provincial Textile Commissioner, Assam, for procurement of cloth and yarn for that province with effect from 1st January 1945. He has his office at Hararwala Building, Ballard Estate, Bombay.

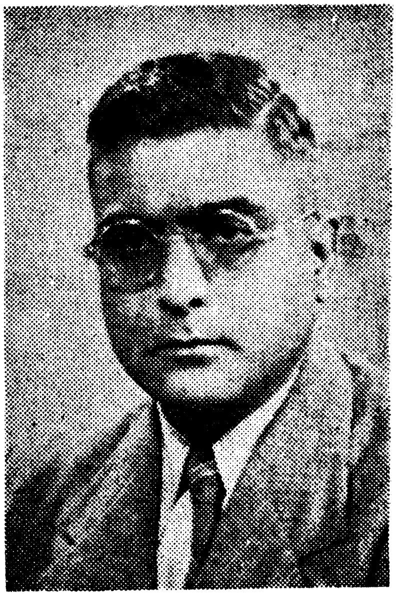
At the recent Annual Meeting of the members of the American Society for Testing Materials held at New York, U.S.A. the following office-bearers were unanimously elected for the year 1944-45: —Messrs. P. H. Bates, President; Arthur W. Carpenter, Vice-President, and the following as members of the Executive Committee (1944-46): Messrs. W. C. Hanna, L. B. Jones, J. T. MacKenzie, J. G. Morrow, and Sam Tour.

Sir Chunilal B. Mehta, leader of the Indian Delegation to the International Business Conference held at New York last month, has returned to Bombay.

In an interview he said that, although India feels that the lowering of the international trade barriers was necessary after the war, certain safeguards would have to be introduced for the protection of the country's existing industries against the influx of foreign goods.

Sir Chunilal added that although India's small industries had grown since the war, the country's heavy industries were still backward and must be protected to prevent a complete collapse of industrial development. "This should not be taken to mean that India is adopting a policy of economic nationalization," he emphasized. "India has raw materials and plenty of labour and also home markets. It is her idea to raise the standard of living and the purchasing power of the country."

Mr. J. B. Greaves, C.B.E., M.L.A., J.P., Honorary Chief Controller of Raw Materials and Stores, Government of India, Bombay, the newly appointed Sheriff of Bombay, was presented with an address referring to his selfless services at a social function in his honour, organized by the Indian staff of Messrs. Greaves Cotton & Co., Ltd., and its allied companies, at Forbes Street, Bombay. Mr. Bomanji H. Bharucha presided. Mr. *Dadabhoy M. Bharucha, Mr. D. A.* Patkar, Mr. Anantrao, Mr. F. Fernandez and Mr. D. M. Gupte paid glowing tributes to Mr. Greaves. Mr. Greaves made a suitable reply.



Mr. R. D. Char, the proprietor of the Industrial and Agricultural Engineering Company, and partner of Associated Textile Engineers, Bombay, has left for the United States of America to study the latest developments and methods of the manufacture of lead-acid batteries with a view to negotiating and selecting personally the plant for modernizing and expanding their present Battery Factory—The Standard Batteries, Ltd., Bombay, of which he is Chairman of the Board of Directors.

Mr. Char has been connected with the supply and erection of special textile machinery and ventilating and humidification plants for the last 26 years and will be taking this opportunity to get first-hand information regarding developments in the cotton spinning, weaving and finishing processes in U.S.A. with a view to interesting the textile mills in this country in such American equipment and devices as could be advantageously introduced in this country, subject to trade control and Government regulations.

His personal interest and experience in electrical, textile and chemical industries and trade, coupled with his engineering knowledge and qualifications, should stand him in good stead during his visit to the U.S.A. and fit in with the post-war industrial development of this country.

Mr. Char is expected to stay in America for about four to five months.

The Government of Bombay have appointed **Mr. S. S. Rajagopalan,** as Special Officer in the Handloom Section of the Industries Department.

The main duties of the Special Officer will be to build up and deal with the export trade in handloom fabrics and art crafts; to have suitable fabrics to meet overseas orders woven through the agency of the industrial weavers' co-operative associations under the Department of Industries and arrange to have them processed in Bombay and shipped abroad ; to deal with all correspondence with the Industrial Weavers' Co-operative Associations and overseas customers; to scrutinize the periodical sales reports of the district sales depots with a view to taking proper steps for the efficient control of the depots and their development on sound commercial lines ; and to reorganize the Bombay Sales Depot.

Mill Staff News

Mr. James H. Dawson, F.T.I., has been appointed as Resident Consulting Adviser of the Lakshmiratan Cotton Mills Ltd., Cawnpore.

Mr. N. L. Desai, who was the Junior Weaving Master in the Jam Mills, Sholapur, has now joined the Rajratna Mills, Petlad, as Weaving Master.

Mr. Ralph P. Richardson has been appointed Mill Manager of the New Victoria Mills, Cawnpore, since 10th December 1944.

Mr. E. J. Tarapore, B.Sc. Tech. (Manc.), L.T.M., A.M.C.T., who has been working as acting Manager since May last, has been confirmed as Manager of the Osmanshahi Mills from November 1944.

Mr. S. G. Chowdhury, B.Sc., formerly Assistant Secretary to the Birla Cotton Spinning and Weaving Mills, Ltd., Delhi, has now joined the Moon Mills, Ltd., Bombay, as Factory Manager. He belongs to a respectable family of the Jaipur State and is one of the few promising Marwari graduates in Chemical Engineering and Industrial Chemistry, having thorough and practical experience of every branch of cotton mill management.

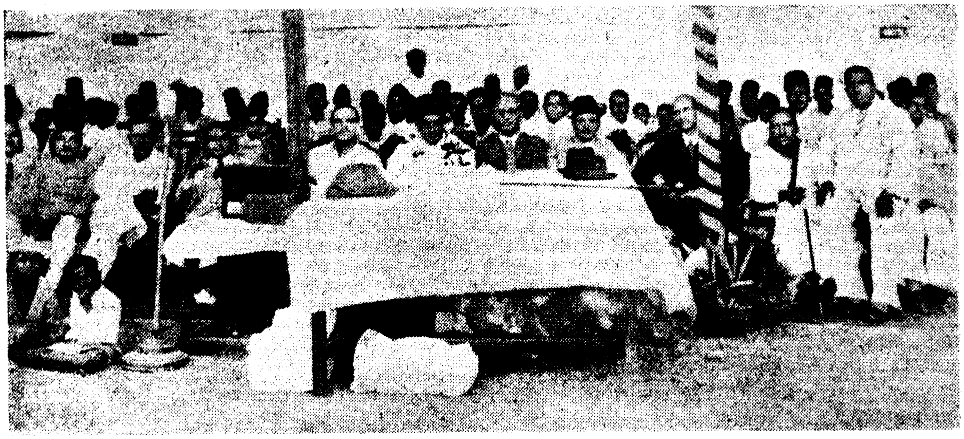
Obituary

Dr. Henry Dreyfus, Chairman and Managing Director of the £15,000,000 British Celanese Limited, died at his London home on 31st December, 1944, aged 62. A fatal heart attack occurred two days after he had issued a reply to criticisms of the company made in the House of Commons.

Mr. Kenneth Gordon.—We regret to record the death of Mr. Kenneth Gordon, aged 64, at Stafford, England, on Wednesday, 8th November 1944. Mr. Gordon was for many years on the staff of Siemens Brothers Dynamo Works Ltd., and subsequently of The English Electric Co., Ltd. He was first engaged as an assistant at the Sheffield Branch of S.B.D.W. Ltd., and in 1909 was posted to their Bombay Branch and later transferred to Calcutta. Early in 1915 Mr. Gordon returned to England and joined H. M. Forces. After his war service he joined the staff of The English Electric Company, Ltd., and in 1920 returned to India, being appointed Manager of their Madras Branch, which position he held until 1936 when he returned to England. He remained an active member of the Export Department, Stafford, until retiring from the service of The English Electric Company Ltd., on 30th September 1940.

The Osmanshahi Mills Ltd., Nanded

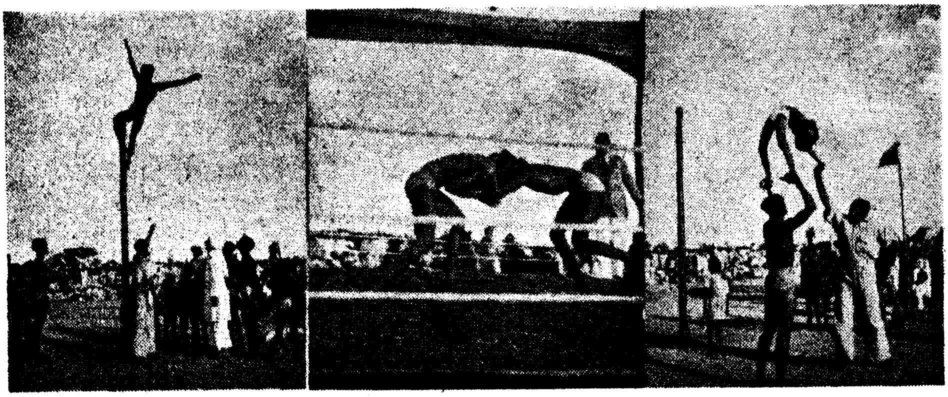
Wrestling Tournament



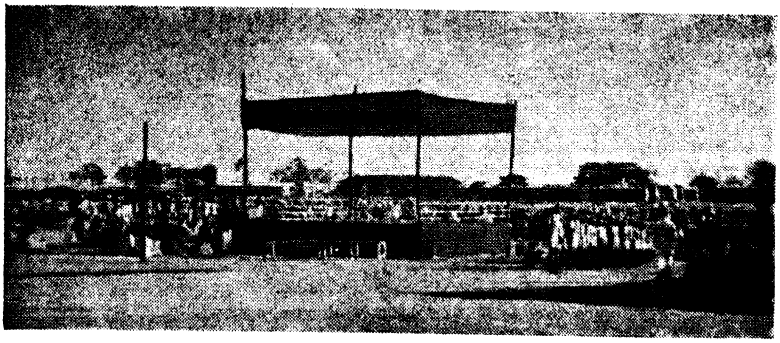
View of the gathering watching the Tournament

UNDER the auspices of the Workers' Welfare Committee of the Osmanshahi Mills, Ltd., Nanded, a wrestling tournament was conducted for the workers of the mills, the finals of which took place on Saturday the 16th December 1944. Nawab Syed Shahbuddin Saheb, District Collector, Nanded, presided on the occasion. Amongst the distinguished visitors who witnessed the contest were the local officials and the constituents of the mills numbering about 150 persons. The mill area presented a festive appearance and the enthusiasm shown by the mill employees was great, about 3,000 people being present on the grounds. Elaborate arrangements were made by the mill authorities for the occasion—a decorated special pandal was erected for the visitors, as well as a specially decorated arena.

Out of 81 people who participated, 50 qualified for the finals. There were 25 bouts and the contestants displayed extraordinary skill in the game, which was very much appreciated by those present. The mill school boys gave a demonstration of drill and *malkham* which enhanced the impressiveness of the day's celebrations. The District Collector distributed the prizes—which were given in the form of cash and cloth—to the winners and other participants.



Views of sports in progress



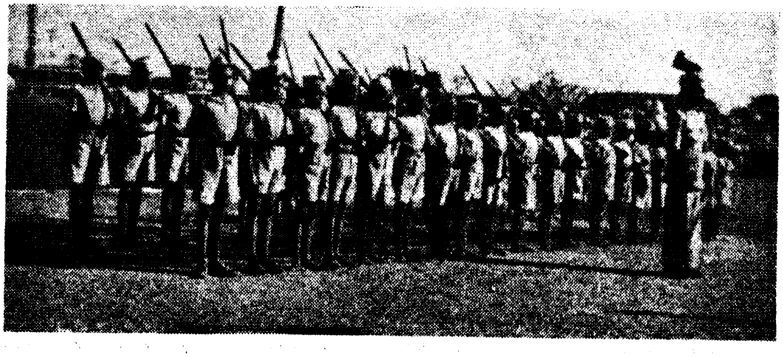
Specially decorated wrestling ring

place of conflict and misunderstanding." He thanked all those present for having graced the occasion by their presence, and also expressed his personal thanks to Mr. Shaikh, the Sports Secretary, for the enthusiasm with which he worked to make the day a success. He also thanked the other officers and staff of the mills and such other silent workers down to a coolie who had worked unflinchingly for the success of the function.

Mr. Tarapore, Chairman of the Workers' Welfare Committee and Manager of the mills, addressing the guests, outlined the activities of the Workers' Welfare Committee since its inception less than two years ago, and said " the reason why the management have taken upon themselves to foster labour welfare is that we wish to treat our workers as human beings and we desire to thrive without taking advantage of them." He continued: " The best of welfare schemes are apt to fail if the workers are not able to appreciate the same on account of their utter ignorance and illiteracy, which is rampant in this country. The Welfare Committee has, therefore, now decided to tackle the problem of adult education—difficult as it is—and arrangements are now afoot to start adult education night classes for workers in the mill premises and also to conduct open elementary group lectures on subjects such as health, hygiene, temperance, current history and geography—lectures in general of topical interest and educative value. Industrial relationship has made great headway in our generation and the happy feeling that exists today is a only modest instalment of what it is possible to secure with proper and reasonable adjustments, provided co-operation, conciliation and confidence can be established in the

The Nawab Saheb addressed the gathering first in English and then in Urdu; the gist of his speech was as follows:—

" I feel great pleasure to be amongst you on this occasion when you are celebrating 'Wrestling Day.' The management are to be congratulated on taking keen interest in the physical development of their workers. Strength and strong physique are essential for maintaining efficiency and to get increased wages. The Government also are endeavouring to provide for your comforts and convenience because the State's progress and development depend on your happiness and welfare. Another thing which I should like to emphasize is 'discipline.' Discipline is the key to success. You should, therefore, obey your officers implicitly because they have in their hearts nothing but your welfare and interest."



Drill demonstration by mill school boys

Dawn Mills Sports Club, Bombay

THE Dawn Mills, Lower Parel, Bombay, has done much to interest and encourage its workers in the line of sport. The mill has not been slow to realize that games and physical exercises are conducive to good health, and good health makes for greater efficiency and contentment.

The sports club, which was started just about a year ago, has progressed very rapidly. This has been due chiefly to the encouragement it has received from the Manager of the mill, Mr. H. Hargreaves, who is a keen sportsman, and also to the co-operation of many of its enthusiastic members. All facilities have been given to the workers to play indoor and outdoor games after working hours and during the recess periods.

During the monsoons this year a carrom tournament was held in singles and doubles. Mr. Hargreaves very kindly donated a challenge shield known as "The Hargreaves Challenge Shield" on which was inscribed the names of the winners of the doubles tournament. The sports club itself donated a challenge cup for the singles tournament. Individual prizes were also awarded to the winners and runners-up of the singles and doubles tournament.

After the monsoon, an inter-departmental tug-of-war tournament was held. This proved very interesting, and created much excitement amongst the workers of each department. The carding and doubling departments have managed to reach the final and very soon they will decide as to which is the stronger. The Spinning Master, Mr. C. Fernandes, has generously donated a challenge cup on which will be inscribed the name of the winning department. Individual prizes will also be awarded to the winning team.

The wrestling pit is ready, and the workers are now busy practising for the wrestling tournament, which is to take place in the first week of January next year. Other athletic events, viz., 100 yards flat race, half-mile race, long jump, high jump and putting the shot, will also be held about the same time. The workers are quite enthusiastic about these events, and are very busy practising for them. The sports club is awarding prizes for the winners of the first three places in each event.

At present the mill is conducting a volley ball tournament open to all clubs in the city and suburbs. The Managing Agents of the mill, Messrs. Sassoon J. David & Co., Ltd., have presented a challenge cup known as "The Sir Percival David Challenge Cup" for this tournament. The name of the winning team will be inscribed on this cup, which incidentally may be won outright by any club winning it for three years in succession. The mill team took part in an open volley ball tournament conducted by the Y.M.C.A. (Gilder Tank Branch) about the middle of June when they were runners-up. They gave their opponents a hard fight in the finals and were unfortunate not to win. In addition to the games mentioned, badminton, tennis, and chess are also played in the mill.

The club has also started a library, which contains the latest technical books, novels, magazines, etc., in different languages. These books may be read in the club's reading room or taken home as desired by its members. Thus the sports club not only helps its members to improve their health, but also endeavours to increase their knowledge and widen their outlook on life.

Social Gathering of Thackersey Group of Mills' Staff

A SOCIAL gathering, said to be the first of its kind in Bombay, was held on Monday the 1st January 1945 at the Sunderbai Hall when more than 1,000 members of the staff of the Thackersey group of mills in Bombay and their families were present.

On this occasion a popular Marathi drama, Kulavadhu, by Natya Niketan was staged. During the interval a tea-party was given. The Managing Agents who were present throughout the function with their families are to be congratulated on organizing such a pleasant function which helps to bring about closer relations between employers and the members of the staff and also among the staff themselves. The whole function was a complete success and this example may be followed with advantage by other mills.

Two views of the gathering. Seth Krishnaraj D. Thackersey with other Directors and their families is seen in the first group on left.

Commercial and Technical Organizations

Associated Chambers of Commerce, Calcutta

H. E. The Viceroy's Address

THE annual meeting of the Associated Chambers of Commerce was held in Calcutta on Thursday the 14th December 1944 under the presidentship of Mr. K. W. Mealing. His Excellency Lord Wavell, Viceroy of India, was present on the occasion. Post-war problems of trade, commerce and industry, the country's food policy, war risk insurance, and income-tax figured on the agenda. In the course of his presidential address Mr. Mealing referred to post-war reconstruction and said: " It must, I fear, be anticipated that some interests will desire to shape industrial planning with greater regard for their own benefit than that of the country, and that political and racial slogans will be used to that end. I trust such a policy will not prevail, as it can only stultify efficiency and progress towards sound industrial development."

The following are extracts from the address of His Excellency the Viceroy:

Post-war Planning

" I do not propose to enter into details of our post-war planning. As men of business, you will realize the possibilities and the difficulties. I will deal only with two broad aspects—the relations between agriculture and industry and the financial problems.

" Though it does not arise directly out of Mr. Mealing's address, I should like to make a few remarks on the relative importance of agriculture and industry in the post-war development of India. I feel that there may be a tendency in our plans to stress industrial advance at the expense of agriculture. There is some reason for this. Industrialization shows quicker and more obvious results, enriches a country and enables it to spend more, both on luxuries and on social services, such as health, education and communication. Also, I am afraid, men of business have more influence than farmers in the direction of State affairs.

" But industrial expansion should not, and must not in India be accomplished at the expense of agriculture, which is still the employment of about three-quarters of the ever rising population.

" It is essential that in your post-war organization the Indian farmer should be assured of prices for his produce that will both improve his own standard of living and will encourage him to produce the additional food needed for the proper nutrition of the existing population and of its normal growth.

" India cannot go back to the spinning wheel, and must develop her industry, but she should consider well these and other examples of the price that may be paid in human health and life for too hasty or too speedy industrialization.

" The financing of progress such as India must make is a very complex problem. One fact is inescapable. If you want progress—and India not only wants it but must have it—you have got to pay for it. No financial jugglery can produce for a nation in the long run greater wealth than that with which it has been endowed by nature in resources of minerals and such like, or which the skill, enterprise and hard work of its population have earned. It is the business of a nation's financial advisers to see that its wealth is fully mobilized, wisely used and so distributed as to benefit the greatest possible number of the population.

" One direction, however, in which it seems to me that we can make progress at once, without waiting for peace or for blue-print, is in training the many technicians and experts India will require—in farming, in engineering, in electricity, in chemistry, in fisheries, in building, and so forth.

" It has been very patently brought home to me even in a year's experience as Viceroy, how woefully short India is not only in persons trained in the applied sciences but in institutions and facilities for training them. I hope that young India will apply its abilities and energies towards these practical branches which will be of such value to India: and possibly a little less to the profession of law in which I understand India is already quite reasonably well staffed.

Sterling Balances

"Before I leave this subject of post-war development, I will mention very briefly two points. The first, which was mentioned by your President, is the matter of sterling balances. I share his entire confidence that these debts will be honoured. But that does not, of course, mean to say that India will at once after the war receive a payment of so many hundred millions in cash. She could not spend such a sum in the international market if she did. The manner of payment of international debts incurred during the war will require much discussion and negotiation. I am quite confident that in these negotiations, the value and magnitude of India's contribution to the Allied war effort will be recognized: that her needs will be considered: and that the manner of liquidation will be arranged to meet her planned development. I do not see that political considerations need affect the settlement.

"The other matter on which I should like to say a very few words is the relations between the British and Indians in business. As I said here last year, I believe there is a cordial spirit of co-operation towards Indian business at present in Great Britain: and the sooner that representatives get together the better. I am, therefore, sorry that it has not yet been possible for the projected visit of Indian industrialists to the United Kingdom to be carried out. I hope that it will not be delayed much longer."

Resolutions

The following were among the resolutions passed at the annual meeting:—

"This Association reaffirms the resolutions adopted last year on the subject of post-war trade policy and post-war reconstruction. With the end of the war in sight, and with long-term plans under preparation for raising the general standard of living by an intensification of agricultural and industrial expansion and development, the Association is further strengthened in its conviction that for the successful pursuit of the reconstruction policy a better balanced and more scientific tax structure based on what agriculture and industry can bear is an essential prerequisite: it, therefore, urges that at the earliest possible opportunity an inquiry be undertaken with a view to evolving a tax system which will be conducive to, and which will promote the objective of the reconstruction policies."

"That whilst appreciating the necessity for exercising controls in time of war over various commodities in order to ensure their most equitable distribution having regard to the amount of these at the nation's disposal, this Association places on record its opinion that where there is frequent overlapping and duplication by different ordinances and/or any other war-time emergency legislation, steps should be taken by the Government to ensure that these do not react to the detriment of the normal long-standing legitimate channels of trade.

"Further, that this Association urges on the Government the necessity for an assurance that as circumstances permit, prompt action will be taken to free trade from unnecessarily irksome control, thus avoiding the danger of unduly prejudicing a return to, and the future of, normal trade in this country."

"Having regard to the continued improvement in the war situation and in view of the substantial amounts standing to the credit of the funds under the schemes this Association recommends that, for the present, no further premia be collected in respect of the War Risks (Goods) Insurance Scheme, and that the payment of premia towards the War Risks (Factories) Insurance Scheme cease after 31st March 1945, but that Government continue to provide cover against war risks under the schemes and that the position of the two funds be reviewed before the end of the year 1945."

Employers' Federation of India, Bombay

Annual Meeting

THE following are extracts from the presidential address of Sir Homi Mody at the 12th annual general meeting of the Employers' Federation of India, held at Bombay, on Monday the 18th December 1944:—

State and Industrial Planning

"A notable lead was given to the idea of planned economy by the Rs. 10,000-crore Plan sponsored by some of the most eminent of our industrialists and economists, and there is no doubt that, in focussing attention upon the fundamental problems of the country and upon the tasks that lie ahead, they have rendered a public service. Since then, various plans have seen the light of day, some more ambitious, some less, and it would appear as if a regular competition had set in, in which the aim of some of the participants was to outclass and outdistance the original planners. It is not my purpose to join in the fray. I only wish to offer a few observations on the question of the role of the State in industrial planning, which is of the essence of the problem. On this fundamental issue, it would be as well if we waited and watched the developments that are taking place in the two greatest democracies of the world where political and economic liberties have achieved their highest consummation. Our admiration of the heroic achievements of Russia must not hustle us into an unquestioning acceptance of State control and regimentation of the economic life of the country. We need to pause and consider the price that must be paid. As Mr. Geoffrey Crowther of the *Economist* has said, 'a wholly planned economy is incompatible with any degree of political freedom. The possibility of a man's earning his own living in his own way, without let or hindrance, is the essential condition of there being any freedom of discussion, any freedom to oppose. If more than a fraction of the electorate come to depend for their livelihood upon the temporary masters of the mechanism of the State—that is, upon the politicians—then Democracy is at an end.'

State Control *vs.* Private Enterprise

"With the general objective of all plans of reconstruction, everyone must be in agreement. It has been admirably stated in the Philadelphia Charter, which lays down that 'all human beings, irrespective of race, creed or sex, have the right to pursue both their material well-being and their spiritual development in conditions of freedom and dignity, of economic security and equal opportunity.' Surely, there is more than one road to the attainment of this goal. As pointed out by Mr. Oliver Lyttleton a few months ago, the ultimate objective is to combine the organizing power of the State with the enterprise and initiative of the individual, and, as a general principle, he suggested that public services from which risk had been eliminated and which depended on statutory rights, should be provided by the State, that the field where risk had to be run should be left to private enterprise and that private enterprise, having run the risk, should be allowed to reap the profit. In broad outline, I am inclined to agree with this enunciation of policy. We must steer clear of both extremes and find a middle path. Unregulated capitalism is as much to be avoided as economic regimentation of the type which seeks to supplant individual initiative and enterprise by the machinery of the State. Industrial expansion in this country can become an accomplished fact only if the organizing powers of Government are employed as an aid and a corrective to private enterprise, and not for the purpose of an overriding control.

On the Labour Front

"On the labour front, there has been the usual activity at Delhi, but few shots have been exchanged. The machinery of the Tripartite Labour Conference has helped to bring about a closer understanding of the aims and a better appreciation of the difficulties of each side. The Federation's attitude towards questions of social security has been defined on more than one occasion. We have supported the concept of a better social order, and we have demonstrated our readiness to move with the times. All we have pressed for is that proper regard must be paid to the special conditions of Indian industry, and that concentration on the conditions of life of a very small section of the population, without any consideration for the general standard of living of the masses, cannot be regarded as fair and rational.

"Coming to particular measures, it will be remembered that last year the Tripartite Labour Conference passed a resolution in pursuance of which a Committee has been appointed to investigate questions of wages and earnings, employment and housing and social conditions generally of industrial workers. When the necessary data have been collected, a mixed committee will be set up to formulate plans of social security. When such a body is formed, I have no doubt the representatives of industrial interests will approach its deliberations in a spirit of helpfulness. The Bill to provide for at least six days' holidays with pay to industrial workers stands referred to a Select Committee of the Central Legislature. Many employers have adopted more liberal schemes of holidays, and while, therefore, we could have no objection to the principle of the measure, we feel Government have not been well advised in introducing legislation regarding a matter in which employers were providing tangible evidence of their goodwill. Sickness insurance is another of the subjects on which an early decision is likely to be taken. Our viewpoint on this measure has been unequivocally expressed; we are willing to shoulder our share of the burden as soon as a satisfactory scheme, providing for an equitable distribution between the State, the employers and the workers has been evolved. Government, however, have not been very helpful on this point; the Provinces seem opposed to contributing anything to a scheme which would benefit only a particular section of the population, and the Centre has not yet made up its mind. Government would appear to have a congenital reluctance to doing anything which would affect their own finances. One can understand it, as they have always been playing with other people's money. We have heard nothing, for instance, about the demand put forward by the textile interests of the country for an adequate allowance in the matter of rehabilitation of capital goods which have been subjected to special wear and tear in working under war conditions. The Central Board of Revenue are lying very low on this subject; I suppose they believe in wearing out their opponents.

Permanent Tariff Board

"Sir Ardeshir Dalal, in a recent statement of policy, indicated the possibility of the establishment of a permanent tariff board on a very high level, which would deal not only with protection to industries, but also with problems of industrial development, investment, licensing of factories and the like, in the post-war period. The creation of such a body is a matter of urgent necessity. Not only does the policy of discriminating protection call for a radical revision—a subject on which some of us have been agitating for years—but the issues involved in State-aid to planning and development demand expert scrutiny at the hands of a body in which the public has confidence. A properly constituted tariff board, or board of trade, would be of great help in the solution of the many problems that will confront Government in implementing their policy of an ordered development of industry."

Sir Ness Wadia's Speech

In seconding the adoption of the Report, Sir Ness Wadia said: "Your Chairman has drawn your attention to the fact that proper regard must be paid to the special conditions of Indian industry, and that concentration on the conditions of life of a very small section of the population without any consideration for the general standard of living of the masses cannot be regarded as fair and rational. He has also placed before you the various measures which the Government of India have brought forward in introducing legislation regarding holidays with pay, sickness insurance, etc. All these measures of Government are worthy of attention and deserve our support provided that labour responds to the adoption of such measures by increasing its efficiency. These measures will, however, increase the cost of manufacture, which can only be kept down if by increased efficiency we get increased production and the cost of production does not go up.

" Recently, the Government of the United Kingdom sent a mission to the United States of America headed by Sir Frank Platt. Their report refers to the American cotton spinning and weaving mills and compares the productivity of labour in America with that of labour employed in British mills, pointing out the differences between the two countries. With normal staffing, British production per man-hour is less than the American by approximately 18 to 49 per cent. in spinning, 80 to 85 per cent. in winding, and 56 to 67 per cent. in weaving. Therefore, for a given output considerably greater labour force is required in the British mills than in American mills. British labour requirements exceed the American by approximately 22 to 98 per cent. in spinning, 400 per cent. in winding and other departments, and in coarse and medium count spinning by 12 to 63 per cent. If that is the position in the United Kingdom as compared with the U.S.A., I wonder what the position will be in Indian mills, and how the efficiency of Indian mills compares to that of the U.K. and the U.S.A.?

" Therefore, it is of the utmost importance that, if the security measures proposed by the Government of India are to be adopted, labour must respond with greater efficiency and help to keep down the cost of production. But unfortunately my experience in Indian mills is not encouraging. We get a good deal of efficiency from labour if it is properly looked after, where piecework prevails in weaving, but in others it is woefully lacking. I find that, during the last four years, since the introduction of dear food allowance, labour has not been making any effort to increase efficiency—in fact, owing to the very high amount of dear food allowance they get, they do not even care or try to increase it; on the contrary, in some cases, efficiency has gone down, specially in winding and reeling. The question, therefore, is: Will labour respond and try to increase its efficiency and make it possible for Indian mills to face competition? Again, in India most of the mills have two looms to a weaver, in the U.K. one woman attends to 4 looms, and in the U.S.A. they attend to something like 8 to 10 looms and very much more in automatic looms. In America greater economy is thus secured in the utilization of labour by permitting operatives to supervise more units or machines where practicable. Therefore, all such security measures as are proposed by the Government of India are possible only if labour will respond by increasing its efficiency per man-hour or per machine. I would like the Employers' Federation to take up this subject, and have a record of the output turned out per man per hour."

The East India Cotton Association, Limited

President's Speech at Annual Meeting

IN the course of the speech delivered by Sir Purshottamdas Thakurdas, President, East India Cotton Association, Ltd., at the twenty-third annual general meeting of the Association held in Bombay on Friday, the 22nd December 1944, he said:

" During the year under report, for the first time in history, the Government of India bought Indian cotton on an appreciable scale to support prices. The figure of such total purchases, both in Bombay and up-country till August last, as reported by the Textile Commissioner, is given in the report and to date they amount to 277,920 bales. The trade undoubtedly recognize that these purchases, whether they steadied the cotton market or not, did prevent further deterioration in prices of cotton. The Report deals at some length with discussions by your Board with Sir Cyril Jones, when he was Acting Finance Member to the Government of India, and with Sir Akbar Hydari. Although the Government did not accept certain suggestions of your Board regarding the working of the hedge contract and other details in connection with purchases of cotton by them, I am glad to record that whenever any suggestions were brought to the notice of the Textile Commissioner on behalf of the Government of India, immediate attention was paid to them and the views of your Board were fully examined. While there have been undoubted differences of opinion between Government and your Board regarding the institution of control over cotton and the fixation of rates, the working of the Government scheme, such as it was, has been fairly smooth.

U.S.A. Subsidy

" As we approached the end of the cotton year, and when there was a glimmer of hope of the partial opening of the Continental markets, the U.S.A. Government sprang a surprise by notifying their intention of giving a substantial export subsidy to American cotton. Necessary representations protesting against this were made to the Government of India. I am glad to be able to say that the Government have taken prompt steps in this matter and have conveyed correctly to the Government of the U.S.A. the reactions of the Government of India in this matter. I am looking forward to a clearer appreciation of our point of view as a result of the special officer's visit to America. I hope that, on his way from America to India, he will be deputed by the Government of India to visit Liverpool and London with a view to arrange for disposal of the stocks of cotton lying in India which the Continent used to buy in normal times. These accumulations of cotton have been piled up as a result of the loss of the Continental markets and latterly of the Far Eastern markets, and also owing to the absence of any crop planning policy from the Centre to adjust our supply position to the internal needs. These stocks now lying in the country tend to weaken the statistical position to the detriment of the growers, and I have no doubt that the Government of India will do their best for the disposal of these accumulations in the foreign markets which need these supplies.

Planned Crop Production

"In the meantime a sub-committee of the Indian Central Cotton Committee has recommended what has been called planning of the cotton crop of India, both in the immediate future and for long term. They have already made their report and with the acceptance of that report by Government, the avoidable burden hereafter on the cotton market should be lightened. Regarding long-term planning of cotton crop the sub-committee has naturally recommended that it is desirable to watch the final stage in the international upheaval under which the world has been for the last five years, and indeed the policy for distribution of raw materials after the war. The Board of the Association has been trying its best to help to devise methods of marketing the grower's cotton crop to the best extent that circumstances permit. It may be of interest to note that whilst there was a negligible minority in the cotton trade definitely against forward trading being opened, even Liverpool has now thought it necessary to press the Government of the U.K. to allow forward trading to be started there. And this move has found unequivocal support from the recent unofficial International Conference in the U.S.A. which urged early restoration of private enterprise and the reopening of the Liverpool futures market. If this be necessary for a consuming centre like Liverpool, it stands to reason that for producing, distributing and consuming centres like Bombay and Karachi the closure of the forward cotton market would have been an absolutely unjustified step. I feel that the cotton trade and the grower of India may fairly infer from this that the decision taken by the Association and the 'D' Committee of the Textile Control Board has, on the whole, been vindicated. It is upto everybody in the cotton trade and upto the Government of India to see that the contract which has been in operation is worked in the correct spirit in which it was meant to be, in the interest of all concerned.

"During the last few weeks, a sub-committee of the Cotton Movements Committee, which was asked to report on the question of disposal of about 50,000 bales of last year's Westerns cotton grown in Adoni, Bellary, etc., has made definite recommendations for the relief of the holders of this cotton. The report has been unanimous and is awaiting the decision of the Central Government. I hope that it will be accepted under the special circumstances referred to in the report. This will be a very welcome proof of the solicitude of the Government for the grower and others concerned in the disposal of their crop in such unforeseen circumstances. The Cotton Crop Planning Sub-Committee that I have referred to earlier has definitely recommended that no seed of this inferior quality be allowed to be sown in the years to come, and, therefore, there should be no fear of a repetition of such a contingency arising again. I hope that the unanimous report of this sub-committee will be accepted by the Government of India, especially as they have a large sum at their disposal for the specific purpose of giving relief to the cotton growers of India.

"Before concluding, I would say that if, as a result of the acceptance of the crop planning as recommended by the Central Cotton Committee, the cotton crop of India is adjusted to domestic needs, certain changes may be necessary in the futures contract. When the Indian Cotton Contract was evolved, there was a prospect of a crop of 60 lakh bales as against a possible consumption of 40 lakh bales, and, in order that the contract may not become a bear contract, certain provisions had been introduced; for example, 12½ per cent. discount on varieties other than Jarilla. With the crop adjusted to domestic needs, this provision may have to go, if the contract is to be saved from a squeeze."

The Millowners' Association, Bombay

The All-India Handloom Board.—The Textile Control Board approved Government's proposals to create an all-India Handloom Board and its functions, subject to the proviso that it would not make any direct recommendations to the Government of India which would adversely affect the working of the spinning and weaving mills; such recommendations, if any, should be referred back to the Textile Control Board. All handloom and powerloom factories which did not come under the Indian Factories Act are to be within the purview of the Handloom Board.

Compensation for Involuntary Unemployment.—The Association has asked Government to make the position clear as regards the scope of the regulation and the eligibility of particular classes of workers for benefit under the scheme. They want uniform rates and conditions of payment to be statutorily enforced throughout British India and Indian States.

Revised Constitution of the Export Advisory Council.—The Association feels that the interests directly interested in the export trade in cotton piecegoods and yarn are not adequately represented on the Council by the inclusion of two nominees of the Textile Control Board. They suggest that the two or three members from the Advisory Committee which had been set up to assist the Export Trade Controller at Bombay might be included in the revised Export Advisory Council.

The Cotton Textiles Fund Ordinance, 1944.—Reference was made the other day to the representation made by the Association to the Government suggesting cancellation of the amendment to the Cotton Textiles Fund Ordinance which empowered the Collector of Customs to exempt from the cess goods which, in his opinion, were exported for a purpose connected with the prosecution of war.

In reply, Government stated *that clear instructions had already been issued to the Collectors of Customs to exempt from the cess only goods indented for actual defence requirements by the Defence Authorities and that in the circum-*

stances, there was no possibility of the exemption being extended to other transactions.

Joint Adjudication of Trade Disputes—Defence of India Rule 81-*A*.—We have referred already to the views expressed by the Association on Government's proposals for the amendment of Rule 81-A of the Defence of India Rules with a view to provide for joint adjudication of trade disputes in similar undertakings under certain circumstances. Briefly stated, the Association were of opinion that there should be no extension of the scope of the adjudication except on a joint application by employers and labour concerned.

The question was, however, reconsidered by the Association towards the end of November, and although they adhered to the previous view, namely, that adjudication should not be extended except on joint application of both the parties, they agreed to accept Government's revised proposals as an emergency measure, if Government, and only if Government agreed to use the powers in most appropriate cases.

Indian Merchants' Chamber, Bombay

Quotations Offered by the British Manufacturers of Machinery, etc.—In their communication dated 24th November addressed to the Department of Planning and Development, the Committee referred to the question of high prices being quoted by British manufacturers of machinery while registering orders from Indian firms. They also referred in this connection to the conditions which the British manufacturers imposed on Indian importers to deposit a sum in rupees as earnest money equivalent approximately to 5 per cent. of the nominal total net f.o.b. to be paid while the order was being entered into the maker's book to rank for priority; the amount so deposited was to be forfeited in case Indian importers decided to cancel their orders.

The whole question of priority and arrangement to import machinery, the Association observed, was discussed by them with the Member for Planning and Development and added that Government should issue a Press *communique* asking Indian importers to wait till Government had consultations with the British manufacturers.

Utilizing Industrial Research and Granting of Exclusive Rights.—As published in the May issue of the *Journal*, the Association had addressed a letter to the Council of Scientific and Industrial Research in connection with the schemes of research ready for commercial utilization. The Board of Scientific and Industrial Research, in their letter dated the 10th November, informed them that their presumption that exclusive right was given to a single party for commercial exploitation was not correct and added that:—

(i) Every process before being offered for commercial exploitation was examined as regards economic implications, demand and mode of production and the decision was guided by such an examination.

(ii) Depending upon the circumstances of each case the processes were offered for industrial exploitation in any of the following ways:—

(*a*) Free of any charge or against a uniform rate of royalty to all interested parties.

(*b*) On regional basis, the royalty in each case being the same.

(*c*) On monopoly basis.

The Association in their reply dated 20th November suggested that the present system should be substituted by system of licence in order to give greater opportunities to a large number of applicants to take advantage of the schemes in question and added that they would like to be informed as to the number of non-technical notes issued for successful researches, and also desired to know as to how many licences were taken and how many of them were successfully worked up. In conclusion, the Committee submitted that their object in addressing this letter was to urge upon the authorities to introduce a licence system by which industrialists would be in a position to take advantage of the researches carried on under the ægis of the Council of Scientific and Industrial Research Board.

Karachi Cotton Association Ltd., Karachi

Report for the Year 1943-44.—The following are extracts from the annual report of the Association indicating the most important subjects dealt with by them during the year 1943-44.

Prices

The cotton "futures" markets of Bombay and Karachi continued to remain closed at the commencement of the year under review until the end of October when the Central Government permitted the Bombay market to open hedge trading for 1943-44 crop in the Indian Cotton Contract under rigorous safeguards. The heavy declines in the spot values which had followed the closures in May 1943 in pursuance of prohibitions imposed by Government in hedge trading were carried forward into the new year which opened with Sind spot Rs. 25, Punjab spot Rs. 23, 4-F spot Rs. 49 and Sind N.T. spot Rs. 57, 1942-43 crop quotations. Export demand in Deshi varieties in September firmed up their prices to Sind spot Rs. 39, and Punjab spot Rs. 32-8 which, however, eased off at the end of November to Rs. 30-8 and Rs. 26-8 respectively. In the absence of mill and export demand, staples continued to decline and were quoted on 20th November of 4-F. spot Rs. 44-4 and Sind N.T. spot Rs. 51-4. 1943-44 Sind N.T. spot began to be officially quoted on 20th October at Rs. 64 and 1943-44 4-F. spot on 22nd November at Rs. 50-8. Upon opening of hedge trading in Bombay at the end of October, the Karachi market, apart from its local factors, followed mainly the trends of the Bombay market. Almost until the end of January 1944, the "futures" market of Bombay and the spot markets of Bombay and Karachi displayed remarkable firmness. The withholding movement up-country (particularly in the Punjab), disappointing reports of yield and gin outturns and fair mill demand were the principal incentives of the firmness. The Indian Cotton Contract which was lowest at Rs. 437-4 in November touched highest at Rs. 485-12 in January. 4-F. spot in Karachi touched Rs. 55, in January, Sind N.T. spot in

Karachi which had a setback to Rs. 58 ultimately regained strength at Rs. 63 on 31st January. Upon permission being obtained, Karachi market opened hedge trading on 1st February with 4-F. March at Rs. 54-15 and 4-F. May at Rs. 55-2. Initially the market appeared buoyant, but the buoyancy was short-lived, and the market under crop pressure began to give way, declining on 1st March to 4-F. May Rs. 51-8-6, 4-F. spot Rs. 53-4 and Sind N.T. spot Rs. 57-12. At the end of March, with the news of Japanese attack on Manipur, the market became nervous and registered on 30th March 4-F. May Rs. 50-3, 4-F. spot Rs. 51-4 and Sind N.T. spot Rs. 57-12. Thereafter no reassuring and redeeming factors appeared to sustain the market; continuous selling pressure and almost complete absence of mill and export demand conspired to lead the market to steep declines, 29th April registering 4-F. May Rs. 47-2, 4-F. spot Rs. 47-2 and Sind N.T. spot Rs. 49-8. The prices of all varieties had already gone down much below the floors indicated by Government in their Press Note of 18th November 1943. For instance, Sind N.T. of which the floor indicated by Government was Rs. 59 touched Rs. 49-8, and at this stage Government put into operation its discretionary buying plan by offering to purchase Sind N.T. ⅞″ in the Karachi market and up-country markets at Rs. 49-8 ex-plinth Karachi. This action, however, did not help in preventing the onrushing collapse, and the market on 4th May touched the floor of the contract with 4F May Rs. 46, 4F spot Rs. 46 and Sind N.T. spot Rs. 49. Government immediately put into operation their general buying plan by offering to purchase all varieties tenderable against the 4F. hedge contract at the official spot rates of the Association as of 4th May. 4F July attempted to maintain some strength, but that too touched the floor on 9th June. Until the end of the season there occurred no trade or mill demand. But for Government purchases of passable cottons, values of passable cottons could not have been sustained. With the decline to the floor of the contract and with the declines to prices of varieties much below their floors indicated by Government in their Press Note of 18th November 1943, the market sustained heavy losses which, no doubt, would have been aggravated if Government had not purchased freely the passable cottons. At the same time the market could not escape a further misfortune in that what could not be passable for Government suffered comparatively heavy discounts, if at all a buyer could be found. Until the end of the year under review Government did not reach a decision on opening of hedge trading in 1944-45 crop. Upto 31st August 1944, Government's purchases in the Karachi market and in Sind and Punjab totalled 68,784 bales.

Raw Cotton Receipts and Exports

Receipts into Karachi totalled 956,544 bales as compared with 878,731 bales during the previous year. Receipts from Sind increased by about 177,000 bales while those from the Punjab declined by about 100,000 bales. As evidenced by pressings, Sind crop was bigger by about 100,000 bales and the Punjab crop smaller by about 166,000 bales. Shipments from Karachi totalled 875,236 bales as against 745,188 bales during 1942-43. The main increases were in shipments to the U.K. by about 135,000 bales, U.S.A. 60,000 bales, Australian ports 7,560 bales while Asiatic ports and Indian coast ports took less by 4,000 bales and 58,000 bales respectively. During the season shipments by country craft totalled 120,503 bales as against 85,615 bales last year.

The Indian cotton trade situation, resumption of trading in "futures" (hedge) contracts in Karachi and Bombay in 1943-44 and 1944-45 and Government buying of Indian cotton (1943-44 crop) and other problems, viz., export trade control on shipments of Indian raw cotton to U.K. and Empire countries, fire insurance of cotton stored in Karachi and in transit, cotton transport by rail, country craft and steamer, storage accommodation for cotton and commodities in Karachi, supply of steel baling hoops and coal for ginning and pressing factories in the province of Sind, proposals for substitution of Karachi 4F. hedge contract by N.T.—289F. hedge contract, etc., received careful and day-today attention of the Board during the year under review.

Karachi Chamber of Commerce, Karachi

Import of Woollen Goods.—In a communication dated the 20th September, 1944, the Chamber drew the attention of the Assistant Director of Civil Supplies, (Textiles), Karachi, to the effect that there had been some difference of opinion on the question of imports of woollen cloth containing cotton. Previously on referring the matter to the authority concerned, a member was advised that woollen cloth containing more than 10 per cent. of cotton would be considered as cotton cloth and hence would be price marked on its arrival at the port of entry.

The Chamber pointed out to the Assistant Director of Civil Supplies that a large proportion of woollen cloth goods imported into India contained a percentage of cotton higher than 10 per cent. and could in no way be regarded as "cotton cloth." In this connection the Chamber made a reference to Notification No. 1/2(29)-44 C.G. (C. S.) of 8th April issued by the Department of Industries and Supplies, Central Government, wherein under clause (*c*) of sub-section (1) of section 3 of the Hoarding and Profiteering Ordinance maximum prices of woollen goods of certain specifications were fixed. This related to woollen goods ranging from 60 per cent. wool up to all wool. From this it was contended that the intention of the Government of India was to include such mixtures as woollen goods and not cotton goods.

Further, if woollen mixtures were classified for duty under item 48 (6) of the Indian Customs Tariff, they were recognized as woollen goods and not cotton goods. Likewise the Schedule to the Consumer Goods (Control of Distribution) Ordinance 1944, included woollen fabrics (item 12) and it was understood this referred to goods classified under item 48 (6) or other appropriate section of the Indian Customs Tariff.

The Chamber also submitted that no tex-marking was ordered under any section of the Hoarding and Profiteering (Prevention) Ordinance, but was carried out under the provisions of the

Cotton Cloth and Yarn (Control) Order. It was considered, therefore, that the action of the Assistant Director of Civil Supplies, Sind, in ordering woollen cloth (i.e. cloth containing up to 90 per cent. wool) to be texmarked was *ultra vires*, and overlapped the provisions of the Hoarding and Profiteering (Prevention) Ordinance. If, however, such action had been taken in pursuance of special powers invested in him, this Chamber urged that more than 10 per cent. cotton content as a basis for specifying the cloth as cotton goods, was much too low a figure. In the considered opinion of this Chamber all cloth assessed under item 48 (6) of the Indian Customs Tariff should be permitted movement in Sind and beyond as woollens. The Chamber submitted that in no case should goods be classified as cotton cloth unless under 55 per cent. wool content.

Madras Piecegoods Merchants' Association, Madras

Provincial Textile Conference.—A conference of piecegoods interests in the province of Madras was held in Madras early last month under the auspices of the Madras Piecegoods Merchants' Association. Thirty-three associations and chambers of commerce from various centres were represented. The following were some of the more important resolutions passed at the conference:—

"After having considered the outline of the A B C scheme whereby an effort is being made to separate direct quota holders from the rest of the wholesalers, this Provincial Conference of piecegoods interests is of opinion that there should only be two classes of licensees, namely, wholesalers and retailers. It is further of opinion that a merchant should have only one kind of licence, either wholesale or retail, except in cases where a merchant was having both wholesale and retail business before the commencement of the Cotton Cloth and Yarn Control Order, 1943."

"This Provincial Conference of piecegoods interests is of opinion that 12 yards or more per adult should be the basic quota for this province in case it is found not possible to allot a bigger yardage."

"Whereas the merchants of the Madras Province have to pay 3 per cent. by way of sales tax from out of the statutory margin of profit of 20 per cent. allowed under the Cotton Cloth and Yarn Control Order 1943, and whereas the merchants of other provinces enjoy the full benefit of 20 per cent. profit, this Conference suggests that sales tax on turnover of sale of cloth should be abolished till such time the Cloth Control Order is in force or in the alternative to reduce the incidence of tax to one-fourth per cent."

"The production and delivery of quota goods by mills are of such nature as to necessitate the wholesale dealers to club together different varieties of cloth packed in different months while selling to retail dealers who at the same time enjoy no such right of clubbing, with the result that retail dealers are always left with certain stocks of goods for which there is no appreciable demand from the consuming public. Under the circumstances this Conference requests the authorities concerned to permit a retail trader to liquidate such holdings by persuading the consumers to take them along with other better selling lines and such persuasion is not to be construed as an offence under the Cotton Cloth and Yarn (Control) Order."

"This Conference of piecegoods merchants recommends to the Provincial Textile Commissioner that the handloom piecegoods other than those intended for export need not be price marked or fixed for the present."

"This Provincial Conference is unanimously of opinion that export prices for handloom goods going to Ceylon should be fixed only by the textile authorities in India in consultation with the trade as is being done for mill-made cloth and that pending the decision of the Government of India as to the feasibility of extending the scheme prepared by the Provincial Textile Commissioner, Madras, to other parts of India, the said scheme should be brought into operation and requests the Government of India to induce the Ceylon Government to postpone the Retail Price Regulations recently introduced in this behalf by the Ceylon Government inasmuch as the prices fixed by them have no reference to trade qualities and ruling prices of handloom goods in India.

"Further, this Conference is of opinion that certain duties now devolving on the Export Textile Co-ordinator for Ceylon in India and more particularly those relating to the authentification of invoices and of stamping a texmark on handloom cloth exported to Ceylon are superfluous and are responsible for causing considerable delay and inconvenience as certain institutions like chambers of commerce, etc., are already authorized to certify prices and further in that the Provincial Government is agreed in principle on fixing prices for all exportable cloth with the assistance of the trade."

"As dealers in the surplus areas supplying this zone often compel the dealers here to take substantial portions of hand-dyed, hand-printed and other unprice-marked cloth against their quotas, this Conference requests the Provincial Textile Commissioner, Madras, to make suitable representations to the Textile Commissioner in Bombay for discouraging this practice. It is apprehended that otherwise a very large share of the cloth exported into this area by the market will be offered in the shape of *Karkhana* prints and other unattractive material."

"This Conference requests the Provincial Textile Commissioner to recognize district associations of textile interests which dealers are anxious to see actively functioning and associate them with the textile control staff in the matter of the administration of the various Control Orders."

Indian Chamber of Commerce, Calcutta

Third Quarterly Meeting.—The following are extracts from the presidential speech of Mr. B. M. Birla, delivered at the third quarterly general meeting of the Chamber held on Friday, the 5th January, 1945, at 4 p.m.:—

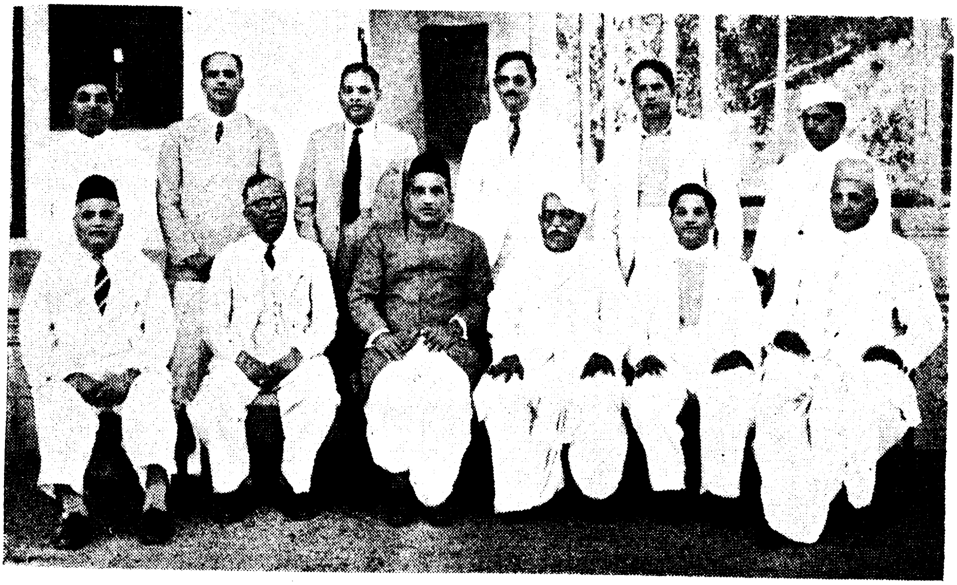
"The revision of the law in regard to patents is becoming necessary. Foreign manufacturers register their patents in this country but they are registered for the protection of their patent rights rather than for allowing the articles thus protected to be manufactured in the country. As you know, the very principle of patent law is to protect a country's nationals. It should be the duty of the Government to revise the patent law in such a way that patents registered by foreigners are given to Indian nationals who desire to exploit them, if necessary on a royalty basis. If we have to invent every device before adopting it, it would take us generations to catch up to present European standards. The amendment of the patent law is, therefore, a matter calling for urgent attention.

"There is also the important question of the railway rate structure. Before the war a number of railways belonged to British companies but now most of them have come under Government management. It would be cheaper and more efficient if the administrations of the different railways were amalgamated and the management centralized. The different railway systems should now be treated as a single unit. For instance, there should be uniformity in rates. Formerly if traffic passed from one railway system to another it had to bear differential rates depending on the railway on which it travelled. Now traffic should be treated as uniformly on one system and the deduction due to the telescopic effect on the rates should be available for all long-distance traffic. This will make goods available cheaper to our countrymen and will promote the establishment of industries in the most economical areas. The railway administration should, therefore, go into the question deeply and arrange that a proper railway rate structure is worked out before the termination of the war to enable industries to be established and distributed in the most suitable way in the post-war world.

"So far as the future is concerned, the statement made by the Planning Member in regard to the liberalization of the protection policy is good as far as it goes. But merely establishing a permanent Tariff Board is unlikely to solve our difficulties unless in the case of major industries, like those relating to machinery manufacturing, automobiles, aircraft, shipbuilding, etc., an assurance of protection is given in advance so that manufacturing may proceed with a guaranteed market. We trust that Mr. Amery's recent pronouncement about the fiscal autonomy of India and the progress which might be made by protecting her industries would be followed in actual practice. When efforts were made to protect our industries in the past, there were always obstacles to be encountered."

Kathiawar Millowners' Association, Bhavnagar-para

A meeting of the members of the Managing Committee of the Kathiawar Millowners' Association was held recently at Bhavnagar to consider the scheme formulated by the Textile Commissioner, Bombay, for the supply of cloth to the Western India States. Two preliminary meetings were held at Rajkot, with Seth Shantilal Mangaldas, B.A., President in the chair, when representatives of various States, textile mills in Kathiawar and merchants were present and the Association decided to extend its wholehearted co-operation in making the scheme successful.



The Managing Committee of the Kathiawar Millowners' Association, 1944-45

Sitting :—Mr. Jadulal C. Maharaja, B.A., Seth Bhogilal Maganlal (*Vice-President*), Seth Shantilal Mangaldas, B.A. (*President*), Seth Ratilal Vardhaman, Seth Ramaniklal Bhogilal and Mr. Girdharlal T. Vakharia.

Standing :—Messrs. Ramanlal C. Shah, J. M. Trivedi, Y. D. Jawale, B.A., LL.B., M. P. Khara, D.Com. (I.M.C.), *Secretary*, C. B. Yodh and V. J. Trivedi.

TRADE LETTERS

(From Our Special Correspondents)

Ahmedabad

THE drastic action taken by the Textile Commissioner in freezing the stocks of cloth merchants in Bombay has prompted the local cloth merchants' associations—the Maskati and Panchkuva Mahajans—to adopt stringent measures to prevent black markets. They have already adopted the quota system with the approval of the Textile Commissioner, on the lines of the quota system of Government. Now they have started distributing the quotas of their members to the quota-holders, both local and up-country. Mr. J. K. Thakore, Provincial Textile Controller, who recently visited Ahmedabad, saw the working of the quota system of these two Associations and expressed satisfaction with it.

Ahmedabad merchants foresee coming events and shape their conduct accordingly. They lost their old trade when the new favourite channel was created by the mill agents. After its suppression by Government they are cautious not to create black markets so as to compel Government to suppress them like their brethren in Bombay. They are supplying cloth to their own quota-holders as they receive cloth from the mills according to their quota. But there are a large number of quota-holders who receive no quota or inadequate quota. They are tempted to buy and sell cloth in the black market. The two associations contemplate supplying cloth to their own members who are non-quota-holders to enable them to continue their trade. Still about 50 per cent. of cloth merchants are not members of either of the two associations and they are threatened with extinction. They are inclined to create black markets unless Government cancel their licences.

There is another source of black markets. Government have not yet fixed the rates of printed and dyed cloth. Mills which were not printing or dyeing their cloth before, are taking to these processes, and charging fancy prices from their quota-holders who in their turn do the same. The hand printers and dyers in consequence are losing their trade, and have no other alternative but to resort to black marketing. Of late, they have closed down their works and made representations to the authorities. The cloth merchants' associations are willing to accommodate them on the basis of their quota system, but very few hand printers and dyers have quotas. They too, like the numerous cloth traders, have taken to printing and dyeing to take advantage of war conditions. Government should fix the rates of dyed and printed cloths like those of the other varieties of cloth to put a stop to the most potent cause of black marketing in the country.

It is a stupendous task which Government has undertaken to control the distribution of cloth. The zone system which is intended to distribute cloth evenly from the surplus to the deficit areas is not working smoothly. Out of 50,000 bales to be despatched to various distribution centres from Ahmedabad only 29,000 bales were despatched during December. This has created a serious situation both in Ahmedabad and the up-country centres. While stocks are accumulating in Ahmedabad godowns, the up-country centres are suffering from acute shortage of cloth. The condition is reported to be worse in Bombay where there is greater accumulation of stocks after Government has undertaken the whole distribution of cloth. It is hoped that Government will soon improve its distribution machinery which is not working as it should.

Why Not an American Loan ?

Mr. A. D. Shroff, one of the signatories of the Bombay Plan, delivered a public lecture in Ahmedabad. He suggested that the Government of India should raise a loan in America against the sterling balances of India, accumulated in London for purchasing capital goods needed for the economical development of India if England could not return those sterling balances to India owing to her economic plight. India needs capital goods which America can supply. If England cannot return the sterling balances to India, she should allow India to raise a loan in America to purchase capital goods. He described the interest taken by America in the economic development of India, and was confident of the success of a loan in America. England is not expected to return the sterling balances to India, but she can be induced to raise a loan in America for India.

University for Gujerat

The idea of a Gujerat University has been mooted by Mr. Amritlal Hargovindas, a mill agent, who founded the Commerce College in Ahmedabad by donating Rs. 60,000. He saw eminent Gujaratis like Mr. K. M. Munshi and others who have formed an association for the establishment of the Gujerat University. This Association is preparing the plan of the University and collecting donations. The industrialists of Gujerat, though welcoming the idea of the Gujerat University, are not sufficiently enthusiastic about it. They have joined the University Association, but have not given donations yet.

There is also no unanimity regarding the location of the University. Mr. Pattani, Dewan of Bhawanagar, suggests the creation of a new University town on the bank of some river. The Association should call a conference to focus public attention in Gujerat on the question of the University. If the princes and merchant-princes of Gujerat including Kathiawar and Cutch combined, they can create a model university in Gujerat.

Calcutta

Increase in Bengal's Quota Urged

PRESIDING over the quarterly meeting of the Bengal Millowners' Association, Mr. R. N. Dutt urged an increase in the quota of cloth allotted to Bengal. He referred to the fact that the Textile Commissioner had arrived at some tentative pre-war consumption figures of cloth on the basis of 10.45 yards per head but he did not know the basis on which these consumption figures of cloth had been calculated. The production of handloom cloth, in his opinion, was a very big factor which supplemented the cloth consumption in normal times. It was estimated that the fall in handloom production had been 30 per cent. below normal due to difficulties in getting supply of yarn. Allocation of cloth on the basis of 12 yards per head of the population was, as it was, quite sufficient to meet the requirements of the Province. Apart from the fact that Bengal deserved special consideration, he was surprised that any discrimination should have been made between her and some of the other provinces like Bombay, the Punjab and Delhi whose quota had been allocated on the basis of 18 yards per head. He hoped that the Government of India would fix a more equitable basis for distribution of cloth in Bengal.

India's Export Markets

The reconstituted Export Advisory Council recently met in Calcutta, and it was presided over by Sir Azizul Haque, Commerce Member, and representatives of different trade interests nominated by the commercial bodies and the Central Government were present. The principal subjects discussed were the allocation of quotas among established exporters, possibility of relaxing export control restrictions, desirability of cultivating goodwill in the export markets and the need for strengthening the commercial intelligence and the trade commissioners' organization. In the opinion of some of the representatives, strict adherence to the principle of established shippers tended to place them in the position of monopolists. They emphasized that the time had come when the basis on which quotas were granted at present should be widened. It was suggested that the Indian Trade Commissioners abroad should keep in touch with conditions in India by visits at intervals. The importance of publicity in export markets, particularly those nearer India such as East Africa, Afghanistan and other places was stressed. The establishment of museums at ports was recommended so that tourist traffic, likely to be encouraged after the end of the war, could take advantage of them and acquaint foreign countries with goods manufactured and sold in India. Representatives of wool, hides and skin interests referred their particular problems to the Council. It was suggested that the existing quota system governing the export of wool should be reconsidered.

Warning to Textile Dealers

Addressing a meeting of the Provincial Textile Control Advisory Committee, Bengal's Civil Supplies Minister sounded a strong note of warning to the dealers in textile trade that unless they wholeheartedly co-operated with the Government in their plans for equitable and speedy distribution of cloth and yarn in all parts of the Province, severe steps leading to the complete control of the textile trade of the Province by the Government, would be taken. He referred to the activities of a certain section of traders in carrying on propaganda against the actions of Government and holding up supplies from the market under frivolous pretexts. In expressing his determination to make cloth and yarn available in every part of the province at controlled prices, he assured them that Government was really reluctant to take up the entire responsibility for the distribution of cloth and yarn and that he desired the normal trade channels to function. It was with this end in view that the quota scheme was introduced, that an independent tribunal was set up to deal with disputes and other problems arising out of the scheme and that it was proposed to vest the tribunal with necessary powers so that they could investigate the cases and ensure the enforcement of their decision subject to appeals to the Provincial Government. He was aware of the existence of black markets in fine varieties of cloth and, therefore, all such varieties of cloth were frozen for distribution through a limited number of selected shops. Referring to the question of yarn supply he said that the fate of 20,000 weavers depended on a proper supply of yarn. Under the new scheme yarns of 20s and above were being frozen and the frozen stocks were being distributed among the various sub-divisions on the quota basis. Supplies were also being given to non-spinning weaving families and other deserving institutions. Referring to the difficulties of the weavers and the inconvenience of those in the districts he said that it was proposed to appoint a handling agent who would carry yarns from Calcutta and distribute them to the weavers on ration basis.

Comments on the Warnings

In commenting on the warnings issued by the Textile Commissioner and the Civil Supplies Minister of Bengal, the Secretary of the Retail Cloth Dealers' Association observed that all such warnings seemed to suggest that the trade was responsible for black markets and that the Government was not to be blamed in the least. He did not agree with this view and was of the opinion that non-distribution of the margin of profit between the wholesalers and retailers in the first stage and wholesalers and semi-wholesalers in the later stage, disproportionate stamping of rates, obstacles raised in transport, exceedingly lower quota to the military zones like Bengal, continuous amendments in the Cloth and Yarn Control Order and the loopholes therein left, enforcement of the orders without taking the opinion of all sections of the trade, indifference shown in making the supplies available to the retailers and petty retailers in particular, non-interference with the unjust activities of the Provincial Government, indiscriminate issue of retail licences to the wholesalers and their concerns, failure in detecting and punishing the real big black-marketing wholesalers and indifference in helping the retailers who offered their co-operation in getting hold of the culprits of the above class, might be said to be the main factors in the encouragement of the black market. He appealed to the Government to take into consideration these loopholes, take drastic measures for detecting and punishing the black marketeers and hoarders of cloth and maintain the usual trade channels under strict supervision.

Criticism of the Control Order

Further point to the criticism of the Secretary of the Retail Cloth Dealers' Association is given by the *Amrita Bazar Patrika*, the influential daily of Bengal which, in its editorial comments, observes that the quota scheme, which was designed as a half-way house between an undisguised black market and full Government control, has proved to be a no-man's land for the lawless to forge in. Quota-holders and importers, it adds, many of whom were found to be building up stocks, were put under obligation to sell their goods in the same proportion and in the same varieties to their dealers as in 1940-41-42. The scheme, according to the *Patrika*, began to work but many of the dealers have refrained from giving the required quota list and the Government have now come out with a warning to those dealers who are attempting to frustrate the quota scheme. The *Patrika* regrets that the Government should have taken so much time to come to this decision but it suggests that drastic steps should be taken without any mercy, that racketeers must be punished without any consideration and honest cloth dealers must not be made to suffer for the dishonesty of others.

Returns of Yarn and Cloth

The suggestion that instead of asking cloth and yarn dealers to submit statistical and detailed figures in addition to stock returns, the Provincial Textile Control Office should be required to submit facts and figures of the quantity so far frozen, requisitioned and distributed under permits, has been made by the Marwari Chamber of Commerce in course of a communication addressed to the Commissioner, Department of Civil Supplies, Bengal, protesting against the notification requiring the dealers to submit certain statistical figures. The Chamber points out that all the information required should be made available at the office of the Provincial Textile Controller.

New Textile Control Order

All quota-holders and importers were directed to submit separate returns by 28th December showing month by month their requirements of all varieties of cloth and yarn. Months of the purchases of seasonal goods should be specially noted in the returns. Failure to comply with the above directions will disqualify the merchants from procurement by permit in Bombay, Ahmedabad, etc., commencing from January 1945. All importers other than quota-holders who import cloth or yarn from outside Bengal, e.g., from Bombay, Ahmedabad, Madras, etc., were also directed to furnish to the office of the Provincial Textile Controller by 28th December positively the figures of their purchases during the years 1940, 1941 and 1942.

Restraint of Trade Amongst Retailers

That the recent rule made by the Textile Controller with regard to dealings of textiles by one retail dealer with another is rather injurious, if not suicidal, to the interests of all the retail dealers, is emphasized by the Bengal Retail Cloth Merchants' Association. If the retailers are thus restrained it will be hardly possible to maintain the normal trade channel and it will be extremely difficult for the poor retailer to earn his livelihood and maintain his establishment by selling his goods in small pieces to the small consumer. The restraint, in the opinion of the Association, cripples the retailer, and deprives him of his just and legitimate right to sell his goods to his customers who are either retailers or hawkers and who used to purchase goods from him in bulk. The Association, therefore, suggests that such restraint should be withdrawn and the retailers should be allowed to carry on his trade and to have his dealings with other retailers, hawkers and ordinary consumers. Otherwise, says the Association, the retail trade and the traders will be ruined.

Amendments to the Quota Scheme

Some amendments and additions to the Government's scheme of distribution of cloth and yarn have been notified by the Provincial Textile Controller. Under the amended scheme, quota-holders and importers shall sell their cloth to *bona fide* retailers in Calcutta with whom they had direct transactions or to commission agents in mofussil at a profit of 4 per cent. ex-mill for cloths manufactured within 100 miles radius, and 10 per cent. on cloth manufactured outside 100 miles radius and to wholesalers in Calcutta at 4 per cent. and 8 per cent. for respective radius. Quota-holders of Bengal mills must submit to the Provincial Textile Controller in Calcutta or to Sub-divisional Officers in the mofussil statements of arrival of consignments immediately on arrival. Except those automatically releasable under the notification, no sales are permissible without the specific instructions of the Provincial Controller or the Sub-divisional Officers. Quota-holders and importers shall not dispose of their goods anywhere outside Bengal. Quota-holders and importers of cloth from manufacturing centres in Bengal or outside are permitted to carry on wholesale business provided they satisfy the Provincial Textile Controller that they carried on this class of business before and they maintain a separate identity and separate accounts of the business. They can with the permission of the Provincial Textile Controller sell at ex-mill price plus the actual charges 2 per cent. of their cloth to charitable institutions, staff and relatives.

Basic Chemical Industries

The necessity of closer co-operation and co-ordination between the different departments of the Government, research institutions and the industry for the commercial utilization of the research work carried out in the Universities and research institutions and further development of the chemical and pharmaceutical industries, was emphasized in the Conference of the Indian Chemical Manufacturers' Association presided over by Mr. N. R. Sarker. Referring to the supreme need of setting up a machinery of collaboration between research and industry, Mr. Sarker instanced the case of Soviet Russia which had evolved an elaborate and effective machinery of co-operation between industry and research with striking results. Stress was laid on the development of a powerful coal and coal-tar distillation industry in the country for which there was no dearth of raw material and on which greatly depended the entire chemical and pharmaceutical industry. Concessions, similar to those given by the British Government, should also be liberally granted for promoting industrial research. The Association further urged on the Government to send a mission of Indian technical experts to the United Kingdom, the United States and Soviet Russia to investigate the utilization of by-products and development of allied industries which had grown with the ammonium sulphate industries in those countries.

Training Labour Officers

The University of Calcutta has now undertaken for the last three years a course for Social Welfare Work and the third course has commenced for the third year with 19 labour welfare officers from various parts of India, nominated by the Central Government, and 22 officers attached to different industrial organizations in and around Calcutta. During the first year 22 labour welfare officers attended the course while last year the trainees numbered 26, of whom six were nominees of the Central Government. The social welfare work course was mainly designed by the University in collaboration with the Indian Jute Mills Association for training of industrial labour welfare officers, as both the Association and the University felt that the future industrial labour problem would require scientific handling for which a certain amount of training was necessary. The subjects taught include sociology, statistics, applied economics, psychology, industrial laws and public health and sanitary laws.

South India

Administration of Control Measures in Mysore State

THE Department of Civil Supplies in Mysore, which was constituted by Government on 15th May 1944, for administering the various control orders, has been making every effort to check profiteering and hoarding of cloth. In addition to the executive action which the Department has been taking either for cancelling or suspending dealers' licences, the authorities have instituted prosecutions against twelve dealers for infringement of one or the other of the provisions of the Cotton Cloth and Yarn (Control) Order or the Cloth Dealers' Licensing Order. Three dealers were convicted and sentenced to pay heavy fines ranging from Rs. 100 to Rs. 1,000 and to imprisonment extending up to one month in default of payment of fine. Suspensions and cancellations of licences after departmental inquiries were ordered in 30 cases. In the majority of the cases, the offences related to sale of "un-texmarked" goods or sales at rates higher than the controlled and stamped prices, failure to issue cash bills or credit memo for sales effected. Surprise visits were paid by the Controller of Civil Supplies and the Assistant Controller and the Inspection Staff of the Department from time to time, and a number of dealers' shops were also raided. As a result of the vigorous drive launched by the Department in recent months to enforce the control measures, the wave of hoarding and black marketing, which for a time was rampart, has been brought under control. The Department has taken and is taking vigorous steps to wipe out profiteering in the cloth trade as the law itself gives very decent margins of profit to all dealers, and ensures fair business.

Shankar Weaving Mills

Dewan Bahadur C. S. Ratnasabapathi Mudaliar, Member of the Textile Control Board, declaring open the Shanker Weaving Mills on 23rd December, said that the powerloom industry in the Madras Province had a bright future.

Ramraj Mills

Sir George Boag, Dewan of Cochin, laying the foundation-stone of the Ramraj Mills at Kozinjanpara village near Cochin at the request of Capt. C. R. Mannadiar, stated that the Government intended to extend the Pykara electric power from Chittur to the taluk with a view to encouraging the growth of locally suitable industries and to helping agricultural development.

Madura Mill School Anniversary

Presiding over the third anniversary of the Madura Mills Workers' Colony School at Harveypatti on 16th December, Mr. J. M. Doak, Managing Director of the mills, appealed to the parents to realize their responsibilities and to shape their lives in such a way to be models for their children in the formation of their character and conduct.

The large gathering present included Mr. W. Essex, Mr. A. C. King, Mr. T. K. Sivasamban, President of the Harveypatti *Panchayat*, besides pupils of the mill welfare school and staff.

Mrs. Helen Doak distributed prizes for proficiency in studies, sports and scouting.

Mysore Cotton Control Orders

The Mysore Government have exempted handloom cloth made out of handspun yarn (*khadi*) and handspun yarn from the operation of the provisions of the Cotton Cloth (Dealers Licensing) Order, 1943, and the Cotton Yarn (Control of Distribution) Order, 1943, respectively.

Price Control on Exported Handloom Cloth

The Collector of Customs convened a conference of representatives of trade interess of both Ceylon and India on 19th Dtecember in Madras. There was a discussion on the difficulty of introducing any price control on exported handloom cloth at a time when the internal handloom market and other sections of exported cloth, such as handkerchiefs to West Africa, remained uncontrolled. The difficulty of the Ceylon Government fixing any price without reference to conditions of production in India, was also discussed. There was a general agreement among the trade interests of both India and Ceylon that no landings of cloth up to the end of January 1945 against licences issued upto 31st December 1944, should be liable to the new control. The future control of prices, if any, should be under the direction of the Provincial Textile Commissioner in consultation with the Trade Advisory Committee to be appointed.

The conference was held because the Government of India wanted to ascertain the opinion of South India on the question of the control of prices introduced by the Ceylon Government on cloth and other imports, which caused great hardship to Indian exporters.

American Textiles Distribution Scheme

Great dissatisfaction prevails among the Colombo shopkeepers over the American textiles distribution scheme. The shopkeepers state that the allocation of 360 yards to each trader, irrespective of any consideration such as their business capacity, had done more harm than good. They further allege that their position has been made more difficult and embarrassing by the textile and price-control officials who have made requests for reservations of cloth for themselves and their friends, although it has been pointed out to them that such reservations are prohibited according to the regulations.

Yarn and Cloth Dealers' Licence Fee Enhanced

A Madras Government Press Note states: " A large staff has been employed to enforce the Control Orders relating to cloth and yarn in the Province. In order to cover this expenditure the Government have decided to enhance, as proposed by the Provincial Textile Commissioner, Madras, the licence fee levied now from the wholesale and retail dealers in cloth.

With effect from 1st April, 1945 the fee (*a*) for a licence to conduct business as a wholesale dealer will be enhanced from Rs. 10 to Rs. 15 per annum and (*b*) for a licence to conduct business as a retail dealer will be enhanced from Rs. 5 to Rs. 7-8 per annum.

Raw Cotton Statistics

The receipts of loose cotton at presses and spinning mills in the Madras Province from 1st February to 8th December 1944, amounted to 467,697 bales of 400 lbs. lint as against an estimate of 458,700 bales of the total crop of 1943-44, says a note issued by the office of the Director of Agriculture. The receipts in the corresponding period of the previous year were 398,095 bales mainly of pressed cotton which were received at spinning mills and 4,837 bales were exported by sea while 215,029 bales were imported by sea mainly from Karachi and Bombay.

Cawnpore

Crisis in Cloth Market

THE smooth working of the distribution of cloth in the province has once again been disturbed. The entire cloth market remained closed for three days, as a protest against the new method of allocation fixed for Cawnpore by the Textile Commissioner—it was felt that a 13 per cent. allocation of the normal requirements was most irrational. For the past many months Cawnpore was virtually running short of clothing. It was demanded by the trade that the Provincial Government should take up the matter with the Government of India and ease the situation. Things came to a climax when the Textile Commissioner decided to allot 384 bales of cloth only per month. The dealers were further agitated because the allotted quota would be distributed only amongst the three big dealers of the city.

Earlier, high hopes were entertained and negotiations proceeded smoothly. Though the previous system of distribution had many loopholes, it worked well. It may be remembered that selected firms and nominees of the District Magistrates were the agencies entrusted with the task of distribution. Of course, it entailed some inconvenience to the public, inasmuch as the usual trade channels had no say in the matter. The present system virtually scraps the old arrangement.

Mr. Vellodi's Visit

Mr. A. D. Pandit, Civil Supplies Secretary to the U. P. Government, had prolonged discussions with Mr. M. K. Vellodi, the Textile Commissioner (who visited Cawnpore some time ago) and got his seal of approval for the new system. Mr. Vellodi when he was here had met both the dealers and the people, and as a result of firsthand studies had come to certain definite conclusions. The problem of associating the Kapra Committee with the distribution of cloth in the U.P. was also one of the problems prominently discussed during Mr. Vellodi's visit to this province.

Economic Conference

" The Fundamentals of Planning for the Economic Development of the Country " were dealt with by different delegates to the Fifth Session of the Indian Society of Agricultural Economics held here. Sir Manilal Nanavati, ex-Deputy Governor of the Reserve Bank of India, presided. Economists from different parts of the country attended. " The first fact to be borne in mind," observed the President in his speech, "while planning, was that India was essentially a rural country, and the rural population was composed of men of all grades of civilization from the primitive man to the highly efficient cultivator. Secondly, within each class or community there were people with special characteristics which reacted on economic development. Within the communities there were men of different castes, who were influenced by social customs and religious beliefs which led them on to unproductive expenditure keeping them under perpetual debts." Sir Manilal also stressed that " in any scheme of economic planning, the social environment should be taken into account. Therefore, planning in India should be on a sociological basis covering the whole man and every aspect of his life."

Medical Conference

The 21st session of the All-India Medical Conference was held recently in Cawnpore under the presidentship of Dr. Jivraj Mehta of Bombay. In his address Dr. Mehta dealt with problems such as the paucity of medical relief in the country, preventive measures, public health service, medical research, epidemic relief, Prof. Adarkar's Health Insurance Scheme, and other cognate problems connected with the medical profession.

REVIEWS

Beveridge Explained. By G. D. H. Cole. Published by Vora & Co., Publishers, Ltd., 3-4 Round Building, Bombay 2. Price Re. 1.

The above pamphlet is meant to explain the Beveridge Report to those who want its main proposals stated briefly and in unofficial language. It should enable the reader to quickly understand the report. It is an explanation and not a criticism; for though there are points at which the proposals are open to criticism they are all, according to Mr. Cole, only of secondary importance.

Identification of Fibres and Fabrics. Published by Research Bureau for Retail Training of the University of Pittsburgh, Pa., U.S.A., and the Fisher Scientific Company, Pittsburgh, Pa., U.S.A. Price: $0.80 each.

The Fisher Scientific Company has assembled a testing kit for the identification of textiles. This kit supplements the unaided senses by simple equipment for elementary physical and chemical tests, tests that can be easily applied by any untrained person almost anywhere. Though it is not meant to be a substitute for thorough scientific testing, it will provide accurate information in the majority of cases if handled correctly; in but few instances will it fail to disclose the desired facts. It should enable the expert to check on his initial impression of a fibre. The kit comprises a pocket outfit for identification of fibres and fabrics. The manual under notice, which is a part of the kit, explains the tests to be carried out by simple methods; in three additional chapters it summarizes other facts of importance.

Cottage Industries and their Role in National Economy. By Prof. Rao. Published by Vora & Co., Publishers, Ltd., Round Building, Bombay 2. Price: Re. 1.

The above small booklet embodies four talks given by the author from H.E.H. the Nizam's Broadcasting Station. He pleads for a well-co-ordinated and planned action for resuscitating village industries, which are of paramount importance to the village which in any scheme of economic planning must receive the primary consideration. Cottage industries, according to the author, are bound to solve the problem of unemployment. Examining the economies of cottage industries the author has succeeded in demonstrating their indispensability as a distinct system of production, and concludes with several valuable suggestions for reviving them and helping them to expand. In short, the author is convinced that India's industrial future depends on the resuscitation of cottage industries which alone can give increasing opportunities of employment to our starving millions. He quotes with approval Gandhiji's statement that the "problem in India is the devising of labour—absorbing and not labour-saving machinery."

The lectures are simple and lucid and there is much in them to provoke serious thought on a subject which is in the forefront of current public discussions.

NOTICES

Anatomy of Retted Jute (Indian Central Jute Committee, Calcutta, Agricultural Research Memoir, No. 2.). Price: Re. 1-0-0 or 1*s*. 6*d*.

Quality in jute depends upon the variety grown and the conditions under which the crop is raised and the fibre prepared. It is common experience that when fibre is kept in the steep too long, it becomes over-retted and loses tensile strength. Though the influence of retting on the quality of the fibre has long been recognized, little is known about the structural changes that take place during retting. Nandi and Basu (1938) have done some work in this direction, but from the short note published, it appears that they did not have an opportunity for studying the process in any detail. However, a considerable amount of work has been done on the retting process in flax, which has some bearing on the present study. Tadokora (1913) was one of the first workers in this field, but it was Davis (1923) who studied completely the structural changes associated with the retting of flax stems. Later, Anderson (1927) while making a microchemical study of the structure and development of flax fibres, carefully examined cross sections of retted flax stems at different stages.

For a proper understanding of retting, a detailed knowledge of the structural changes that take place in the stem during the process is very necessary. Therefore, an attempt has been made in this paper to bring out clearly the day-to-day changes in the anatomical structure of the jute stem during retting. The breakdown of the different tissues, which finally leads to the separation of the fibre bundles, has been followed stage by stage. The anatomical features, which interfere with uniform retting and give rise to inferior fibre, have also been studied.

Receipts at Mills in India of Raw Cotton Classified by Varieties, 1942-43 Season. I.C.C.C. Statistical Leaflet No. 3. Price 4 annas.

The above leaflet gives data showing the cotton received at mills in the year ending 31st

August 1943, classified according to trade descriptions and compiled from returns furnished by 92 per cent. of the total number of mills working in India.

The total mill receipts of Indian cotton during the season amounted to 4,230,000 bales (about 4,145,000 bales of 400 lbs. net), whilst the consumption for the season was 4,281,000 bales of 400 lbs. net. Out of the total receipts, the proportion of cotton "$\frac{7}{8}''$ and above" and "below $\frac{7}{8}''$" in staple constituted roughly 68 and 32 per cent. against 58 and 42 per cent. respectively in the previous season.

Distribution of Electricity, Vol. XVII, No. 155, is as usual full of highly instructive contributions, especially the sixth instalment in the series of articles on synthetic rubbers and plastics, contributed by Mr. William S. Perin of the Henley Research Laboratories; the latest instalment points out that, if all the possible cross-linkages between the molecular chains of bakelite could be formed, its tensile strength would be of the order of 4,000 kg./cm. sq., 500 times the strength at present attainable, which is approximately 5 tons/in. sq.

Family Employment: A Step towards Social Security. By H. P. Oza and V. B. Kotdavala. Published by Sandesh Prakashan Mandir, Saraswati Bhuvan, Sarangpur, Ahmedabad. Price: Re. 0-12-0.

This is a "proposal, presented as a basis for discussion, to accept for industrial labour the principle of employment as the family basis and to enable the workers to maintain a dynamic intercourse with their rural homes." In the words of the authors, it is a novel proposal seeking to allay a part of our economic troubles, and is highly interesting.

Bulletin of the Madras Presidency Electric Licensees' Association, Madras, Vol. 4, No. 2, makes it clear that electric licensees in several districts are being exercised by the current discussions on private enterprise *vs.* State ownership in the electricity industry. It is urged that in the Policy Committee of the Government of India room must be found for a representative of the private electric licensees who must be given credit for their pioneering efforts.

Marwari Chamber of Commerce, Calcutta. We have received a copy of the Report of the Committee of the Marwari Chamber of Commerce, Calcutta, for the year 1943 as well as for the period 1st January to 30th September 1944. Divided into convenient sections, the report deals with finance, trade and industry, piecegoods, public affairs and proceedings of the annual general meeting. An important commercial chamber, the Marwari Chamber has been playing a no mean part in moulding public opinion in commercial and economic matters.

We have received from the I.C.C.C Technological Laboratory copies of spinning test reports on samples of **Cambodia, Karunganni,** and **Bailhongal-Jayawant** as well as technological report on **Jayawant-Kumpta** cottons.

Labour Bulletin, Vol. III, No. 2, Quarterly Publication of the Labour Department, Government of the United Provinces, Cawnpore.

The *Labour Bulletin* is the only publication of its kind in the United Provinces disseminating statistical and other information of labour interest collected by this Department. As a monthly journal it was first started in January 1941, but since July 1942, with a view to effecting economy in the use of paper and to suiting all pockets, it is being published quarterly and is available from the Superintendent, Printing and Stationery, Allahabad on a nominal subscription of As. 4 per copy or Re. 1 annually.

There is an interesting article on the need for planning in the economic development of India in the December 1944 issue of **J. K. Review** published by the J. K. Group of industries in Cawnpore.

G.E.C. Journal, Vol. XIII, No. 2. Published by The General Electric Co., Ltd., Magnet House, Kingsway, London, England. The latest issue of this excellent house organ includes a concise and easily understandable review of the fundamental chemistry of plastics by a member of the G.E.C. Research Laboratories.

CALENDARS AND DIARIES FOR 1945

We have received a card calendar for 1945 from **West End Watch Co.,** Bombay, with the public holidays and holidays under charter parties listed on the reverse; a similar calendar has, as usual, been received from the **Bombay Chamber of Commerce,** Bombay.

We have received sheet calendars for 1945, with holidays marked in red, from **Sizing and Finishing Materials Co.,** 60-2, Dharamtalla Street, Calcutta, and the **India Waterproofing and Dyeing Works,** 60-2, Dharamtalla Street, Calcutta.

Messrs. Garlick & Co., Haines Road, Jacob Circle, Bombay, have sent us a copy of their latest wall calendar for 1945, with three months to a page, but each page carrying a different picture beautifully executed.

We have received a useful card calendar for 1945 from **Fleming, Birkby and Goodall, Ltd.,** (Bombay branch: **Card Clothing and Belting Ltd.**) with the holidays listed on the reverse.

We have received copies of good wall calendars for 1945, with the holidays marked in red, also from **General Electric Co. (India), Ltd., Industrial and Agricultural Engineering Co.** and **Insurance Services and Commercial Corporation, Ltd.,** Bombay.

M. Sharma & Co., Manufacturers of acids and chemicals for the textile industry, Gandhi Road, Ahmedabad, have kindly sent us a copy of their handy diary for 1945, with two days to a page. Some useful tables have also been given for the benefit of the public.

We have received, as usual, a pocket diary for 1945 from **Nowrosjee Wadia and Sons, Ltd.,** Neville House, Ballard Estate, Bombay. It contains much useful information on millwork and steam engine, textile machinery and cotton tables and should prove highly useful to mill men.

NEWS OF THE MONTH

Indian

Sit-down Strike at Apollo Mills.—About 500 workers belonging to a section of the employees of the Apollo Mills, Bombay, went on a sit-down strike on Tuesday, 19th December 1944. as a protest against the discharge of one of them.

Membership of the Textile Institute, Manchester.—Admitted recently to the ordinary membership of the Textile Institute, Manchester, were Mr. K. S. Amaria, Weaving Master, Lakhshmi Cotton Manufacturing Co., Ltd., Sholapur, and Mr. R. N. Srivastava, Lecturer in Textiles, Delhi Polytechnic, Delhi.

Shortage of Coal Affects Cotton Mills.—Owing to acute shortage of coal the cotton mill industry in Ahmedabad, Indore, Baroda, Broach and Sholapur has been thrown out of gear and several mills have been forced to close down in those localities. Several thousands of workers have thus been rendered idle.

Bombay Working Class Cost of Living Index.—During November the working class cost of living index number for Bombay, with the average prices for the year ended June, 1934, equal to 100, was 242. This was three points higher than in the preceding month. The index number for food articles advanced by six points to 277.

Industrial Disputes.—During October, 1944, there were 23 industrial disputes in Bombay Province. Fifteen were in Bombay, four at Ahmedabad and one each at Poona, Mundhawa (Poona District), Jambul (Kalyan Taluka, Thana District) and Bandra (Bombay Suburban District). The number of work-people involved in these disputes was 18,249 and the number of working days lost was 27,073.

Madras Labour Demands Inquiry on 12-loom System.—A resolution requesting the Government of Madras to set up a Board of Inquiry, consisting partly of experts, to go into the difficulties caused by the working of the 12-loom system in the Buckingham and Carnatic Mills, was adopted at a general body meeting of the Madras Labour Union held recently. Mr. V. Chakkarai Chettiar, President of the Union, presided.

Textile Calendar

DECEMBER

21st, Thursday :

First All-India Cotton Forecast Estimates for 1944-45 season.

30th Saturday :

Indian Economic Conference Inaugurated in New Delhi by Sir Ardeshir Dalal, Kt.

Marwari Chamber of Commerce, Bombay, Annual Meeting.

JANUARY 1945

5th Friday :

Third Quarterly General Meeting of the Indian Chamber of Commerce, Calcutta.

14th, Sunday :

The Textile Association (India) Public Lecture by Mr. B. B. Joshi, L.T.M. (Hons.), Additional Controller of Raw Materials and Stores, on the "Implications of the Platt Report," Podar College of Commerce, Bombay.

19th, Friday :

Safety First Association of India, Bombay, 12th Annual General Meeting, Electric House, Colaba, Bombay.

21st, Sunday :

21st Session of the All-India Trade Union Congress, Madras.

FEBRUARY

27th & 28th :

Second All-India Textile Conference, Bombay.

MARCH

1st Thursday :

Second All-India Textile Conference, Bombay.

Drop in Acreage under Indian Cotton.—A sharp drop of 24 per cent. in the acreage under Indian cotton during the current cotton season is estimated by the Director-General of Commercial Intelligence and Statistics, Calcutta. The first forecast places the area under cotton at 11,560,000 acres divided into Bengals

1,469,000 acres, Americans 3,129,000 acres, Oomras 3,737,000 acres and other varieties 3,225,000 acres.

Colour Merchants' Association Annual Meeting.—The following members were elected office-bearers of the Bombay Colour and Chemical Merchants' Association at its annual meeting on 16th December 1944. Mr. Ranchhoddas K. Rangwala, (President), Mr. Nariman M. Dadachanji and Mr. C. D. Mehta, (Vice-Presidents), Mr. Muljibhai Somabhai and Mr. G. M. Desai, (Secretaries) and Mr. Kantilal N. Shah and Mr. Narsidas D. Saiah (Treasurers).

Labour Member's Discussion with Engineers.—Dr. B. R. Ambedkar, Labour Member of the Government of India, discussed with the Committee of the Engineering Association of India on 4th instant labour welfare schemes in relation to industrial development.

The question of housing industrial labour, establishment of a Labour Academy for the training of trade union officials and the formation of wages boards were also discussed.

Regulating Purchase and Sale of Cotton in Chalisgaon.—The Government of Bombay has declared its intention of regulating the purchase and sale of cotton (ginned and unginned) and groundnut (shelled and unshelled) in the area of Chalisgaon Taluka in the East Khandesh District, excluding 33 villages lying beyond the Girna River.

Any objection or suggestion which may be received by the Secretary to the Government of Bombay, Revenue Department, will be considered by the Government.

Electrification of Sind: Government's Plans.—A two-crore programme for electrification of every town in the province after the war is being worked out by the Sind Reconstruction Department.

Under the programme, three generating plants will be set up in upper, lower and central Sind respectively, run by hydraulic energy from the Tando Mastikhan Falls near Sukkur. The total output of the system is expected to be about 25,000 kilowatts. Industrial concerns in the province will get a fillip by this system.

New Names for the India United Mills Group.—The five mills and the Dye Works owned by the India United Mills, Limited, Bombay, viz., the Jacob Sassoon Mills, the Alexandra Mills, E. D. Sassoon Mills, the Rachel Sassoon Mills, Manchester Mills and The E. D. Sassoon Turkey Red Dye Works will, with effect from 1st January, 1945, be known as the India United Mills, Ltd., No. 1 Mill; the India United Mills, Ltd. No. 2 Mill; the India United Mills, Ltd. No. 3 Mill; the India United Mills, Ltd. No. 4 Mill; the India United Mills, Ltd. No. 5 Mill and The India United Mills, Ltd. Dye Works, respectively.

Bombay Textile Workers' Meeting.—A meeting of textile workers was held on the 1st instant at Parel, Bombay, with Mr. B. T. Randive in the chair. He urged that the cuts in the " piece rates " imposed in some mills should be restored. He added that one of the mills, which was indefinitely closed, should be immediately opened, and if the owners were not inclined to do so, the Government should take over the management in the interests of the workers and consumers. If the demands of the workers were not to be granted straightaway, he said, they might at least be referred to adjudication. Mr. S. G. Patkar and Mr. R. K. Bhogle also addressed the workers.

Indian Trade with South America.—Considerable interest in trading with India was encountered by the Indian Trade Commissioner, Mr. J. R. K. Modi, who has just returned to Buenos Aires from a four months' trip to Chile, Peru, Ecuador, Colombia and Brazil. Jute and jute manufactures elicited interest in all the countries he visited.

Other Indian products found of general interest were spices, oilseeds, medicinal herbs, Indian silk, both yarn and manufactured wool, certain qualities of leather and small bazaar wares formerly exported by Japan such as household hardware, crockery, glassware, etc. Inquiries were also received regarding the possibilities of the export of chemicals.

India a Big Market for Woollens.—India is envisaged by the International Wool Publicity and Research Secretariat as a great potential market for woollen textiles. A conference of its executive, attended by delegates from South Africa, Australia and New Zealand, has now concluded its work and the secretariat issued a statement reviewing some of its work during the past fortnight at a Press conference in London.

The delegates gave the assurance that they were resolved to maintain the position of wool as No. 1 textile in the world.

The report stated that " the conference devoted much attention to the needs of vast prospective markets such as India, Russia and China, and decided to set up a special section of the secretariat to deal with the particular problem of newly developed countries.

Mr. Douglas Boyd, Chairman of the Australian Wool Board and Chairman of the executive of the secretariat, explained that India, with her huge overseas credit, was a great potential market for wool textiles and the market would no doubt increase after the war with the raising of the standard of living in that country. Hence her economic possibilities would be fully surveyed.

Provincial Industries Committee, C.P. and Berar.—An exhaustive questionnaire has been issued by the Provincial Industries Committee separately to individual establishments in C.P. and Berar, but as time is short industrialists, capitalists, *entrepreneurs* and others interested in the industrialization of the Province have been requested to send in their replies at an early date. The Committee will deal, among other subjects, with the following:

Textiles.—Textile mills, power-looms, ginning and pressing of cotton, silk and sericulture, hosiery, manufacture of textile machinery, examination of existing types with reference to types of cotton, other fibres such as sunn-hemp, linseed stalk fibre, wool, rayon requirements for industry, coir, rope and cordage, power belting.

Minor and cottage industries.—Co-operative industrial establishments, decentralization of industries involving processing of agricultural produce, village workshops, power-loom establishment in villages, hand-looms, weaving, supply of yarn from textile mills to handlooms and to village units of power-looms, subsidiary industries, manufacture of components of major industries, laboratories and workshops for designing new machines for use in cottage industries.

Training of skilled personnel and research.

Sheep Breeding in the Deccan: Bombay Governor Visits Bhamburda Farm.—The Sheep Breeding Farm at Bhamburda, near Poona, has developed a fine flock of sheep with soft, snow-white coats of fleece. The sheep indigenous to the Deccan carry black hairy fleece, but the evolution has been made possible by cross-breeding the Deccan sheep with the pure bred Merino from Africa.

Keen interest in the excellent work of the farm was evinced by the Governor of Bombay when he visited it, accompanied by Lady Colville and Miss Colville. The farm supplies to the rural parts of the province pedigree rams for sheep improvement work. His Excellency remarked that the farm was doing valuable work, which would have to be extended in post-war years.

Subsidized by the Imperial Council of Agricultural Research, the farm was started in 1937 with the object of improving the Deccan breed of sheep by homogeneous cross-breeding. Attached to the farm is a wool analysis laboratory and a small weaving and spinning establishment for research in the utilization of wool in village industry.

His Excellency and Lady Colville expressed themselves pleased with the various types of woollen cloth manufactured in the spinning and weaving establishment of the farm. They were received at the farm by Mr. W. J. Jenkins, Director of Agriculture, who presented to the Governor Mr. D. B. Kolhe, Live-Stock Expert to the Government of Bombay, Mr. B. B. Jamarjinnah, assistant to the Live-Stock Expert and Mr. S. S. Khot, who is in charge of the farm.

Technological Institute : Surat Plan.—A scheme for the establishment of an institute of higher technology at Surat at a cost of Rs. 10,00,000 was presented to Mr. I. H. Taunton, Adviser to the Governor of Bombay, at a meeting of the Managing Committee of the Surat Chamber of Commerce on 26th December 1944. The proposal is to impart instruction in courses up to the diploma standard, including certificate and tradesman courses in mechanical, electrical and automobile engineering. Textile, dyeing and printing, carpentry and wood-carving and hand-made paper-making are included in the certificate course.

Presenting the scheme, Rao Saheb V. C. Jadhav, President of the Chamber, said that the city housed a number of small-scale industries, including a major part of the handloom and jari industry of the country. These industries required little capital but great technical skill. There were small plants for dyeing and printing and small factories for the manufacture of almost all machinery required for the big jari industry. But this was not enough. The city's jari products and cotton piecegoods had an extensive market, not only in this country, but also abroad, and if these industries were to hold their own against foreign competition, they must be technically overhauled. This required a constant supply of technical personnel with up-to-date information and training.

Mr. Taunton, in his reply, pointed out that the framers of the scheme expected the whole cost to be borne by the Government. While the Government would gladly help any technological scheme, part of the scheme at least should be financed by local funds.

Unemployment due to Coal Shortage: Government's Relief Scheme.—The Government of India have, it is understood, formulated proposals in accordance with the recommendation of the tripartite conference, for giving relief to workers temporarily thrown out of employment owing to the shortage of coal and similar reasons. These proposals relate only to short-term unemployment during the period of war due to the shortage of coal or raw materials or changes in lines of production, of which adequate notice cannot be given.

The proposals do not cover closures of factories or of departments due to special Government orders or closures of which adequate notice is given under standing orders, whether statutory or voluntary. Benefit, which should be on a scale lower than the ordinary rate of pay, is suggested to be fixed in either of the following two ways:

One, 75 per cent. of the ordinary rate of pay for the first fortnight of unemployment and 50 per cent. of the ordinary rate of pay for the second fortnight of unemployment with possibly a flat rate of benefit for persons drawing lower levels of incomes. Two, a flat rate which would be about 75 per cent. of the average of lower range of wage rate in the undertaking.

The duration of the benefit is suggested to be one month, allowing for a waiting period of seven days. The cost of the benefits will be admitted as revenue expenditure for income-tax and E.P.T. purposes.

The Government of India have forwarded these proposals to the Provincial Governments and the States, and, while circulating them to the Employers and Labour Associations, the Government of Bombay suggest that, where a stoppage has occurred and relief is not given, a demand for relief would be a fit subject for adjudication.

Institute of Textile Technology, University of Travancore.—The following amendments with regard to the scheme of examinations in Textile Manufacture and Textile Chemistry Diploma course have been made by the Travancore University:–

The course shall extend over three academic years. Candidates shall be required to specialize in one of the two branches, textile manufacture or textile chemistry, during the third year of the course, and diplomas in the branch in which they have specialized will be awarded to successful candidates.

Candidates for the diplomas shall be required to have passed the following University examinations:—

(i) Diploma Examination in Textile Technology, Part I, held at the end of the second year. (This examination shall be common to students of textile manufacture and textile chemistry.)

(ii) Diploma Examination in Textile Technology, Part II held at the end of the third year.

Note.—There will be an examination conducted by the Institute at the end of the 1st year in the following subjects:—Mathematics, physics, chemistry, drawing (free hand and machine), textile chemistry, spinning and weaving, bleaching and dyeing. Sessional work in the above subjects is also valued and marks awarded.

Three-tenths of the aggregate marks obtained by the candidate at the end of the first year (i.e., institute examination plus marks for sessional work) are carried forward to the second year. Five-tenths of the marks for the second year (i.e., university examination marks plus marks for sessional work plus the carry-over from the first year) are carried forward to the third year. The whole of the three years' work in this way will ultimately count in the award of the diploma.

Foreign

Indian Scientists Visit the Shirley Institute.—A party of distinguished Indian scientists who are making a tour of England have visited the Shirley Institute of the British Cotton Industry Research Association. The Principal (Dr. F. C. Toy) explained the scope of the work and its liaisons with the cotton industry.

Training Centres for Textile Industry : British Government's Proposals.—Mr. Bevin, Minister for Labour, England, told the Press that it was proposed to establish one or more Government Training Centres for the cotton industry which would be regarded as models for those to be established by the industry itself. 175,000 operatives had left the industry since the war and the difficulties of meeting post-war personnel requirements were enormous, he said.

India's Industries : Britain's Helpful Attitude.—Speaking at a meeting of the East India Association held at the Caxton Hall, Westminster, England, on 19th October 1944, Mr. L. S. Amery, Secretary of State for India, said: "I can say that the Government of this country only wants to see Indian industry developing to the fullest. The last thing industrialists of this country have in mind is the idea that the British export industry can best prosper by India being held back in the course of her industrial development."

Canada Asks for Lancashire Textiles.—The Canadian Government has asked for 25,000,000 yards of cloth from Lancashire to make good her own insufficient production for essential domestic requirements. Canadian representatives met the Cotton Board and Cotton Control in Manchester recently and stressed that in clothing and equipping their armed forces the Canadian textile industry was unable to meet pressing civilian needs. Special efforts are to be made to meet the request. Canada is also pressing for the lifting of the ban on the import of British textile machinery imposed under Lease-Lend.

Indo-Australian Trade.—India has asked Australia, through the Eastern Group Supply Council, to supply 1,200 ship anchors and 1,057,000 tubes of catgut, and Australia has contracted to manufacture and supply both. The estimated cost of the anchors is £17,500 and catgut £30,000. Recently Australia accepted an Indian order of 200 tons of sulphaguanidine used to prevent and cure dysentery among troops in Burma and for the civilian population of India. Australia is now purchasing from India hundreds of thousands of tons of supplies covering large quantities of textiles and cottons and made-up garments in addition to very important jute and hessian supplies.

School of Industrial and Labour Relations in U.S.A.—A School of Industrial and Labour Relations has been started at Cornell, the State University of New York, states the *Labour Information Bulletin*, Washington.

The purpose of the school, as outlined in the Act creating it, is the teaching of the history of industrial practices of employers and employees, the history and principles of sound industrial relations, the rights and obligations of employers and employees, the development of labour law, and all other phases of employer-employee relations tending to promote the public interest. The school is a part of the State Education Department and as such is open to anyone who is interested in the general field of industrial relations, whether from the management, worker, or public angle.

Textile Industry in Brazil.—The *Brazil News* issued by the Brazilian Consulate in Liverpool states that cotton textiles occupied third place in the exports for February with an amount totalling 8 per cent. of the whole. Naturally Argentina was the best outlet for these goods, taking nearly 62¼ per cent. of the total textile export, but Uruguay was also a notable customer, although her purchases, as well as those of Bolivia, Chile, and Paraguay, were on a smaller scale. Ireland bought representative parcels of every type of cotton textiles exported by Brazil for the purpose, apparently, of testing the possibilities of Brazil as a supplier. However, exports of cotton goods in the first two months of the year to the Union of South Africa were very small in contrast with previous years when South Africa was a big market. There was also a bigger export of raw cotton, the amount representing 12 per cent. of the entire export. Of this nearly 95 per cent. went to Great Britain, while Spain took virtually all the remainder.

Closed British Cotton Mills : Reopening Urged.—The British Cotton Board has recommended that the Board of Trade should fix a date as early as possible, having regard to the labour situation, for the reopening of all cotton spinning mills closed under the concentration scheme on the understanding that care and maintenance payments by the nucleus mills under the proposed legal agreement are allowed as expenses for taxation purposes.

The committee representing the nucleus and closed mills declares: "We are entirely opposed to the method of reopening by any form of selection as between one mill and another except in a few isolated cases. Shortage of labour, says the committee, will be one of the major problems to be solved, and vigorous action by the Government and trade organizations will be necessary to make it good. It is not expected that there will be a sufficient number of operatives to permit the reopening of the closed mills on a considerable scale before the end of the war in Europe."

Platt Report in the House of Commons.—Reference to the report on the British cotton industry as compared with that in the United States was made in the Commons on 6th December 1944 during a debate on exports.

Mr. Hammersley (Conservative) said: "Don't take this black report at its face value." It dealt, he said, largely with the production of standard lines, whereas Britain's future export trade must depend on quality and variety.

The report shows that Lancashire used cheaper cotton than America and produced better yarns. The quality in Lancashire was better and machine productions in Lancashire were greater.

Moreover, the report shows that in the treatment of cotton itself Lancashire had little to learn. It was relevant, however, in the view of the report, to ask the Government what steps were being taken to see that standard lines were organized in the industry. He suggested that individual firms in particular sections of the industry should co-operate for large-scale experimental re-equipment.

Mr. Bowles (Labour) said that after machines had been sold abroad they were used by Britain's competitors in the Far East to build up the trade against Britain at rates she could not compete with, in view of the very low wages paid.

Mr. Dalton said if British industries were not as efficient as in America and elsewhere, then the long-term prospects for British exports would be pretty poor. A great deal depended on the technical British industry in the future.

Fifty Years Ago

(From the *Indian Textile Journal*, January 1895)

New Machinery Showrooms in Bombay

"A welcome sign of the times is the opening of showrooms for machinery in Bombay. This movement was led on a large scale last year by Mr. Ralph Douse, with a very well-lighted and handsome showroom in Apollo Street, containing portable and fixed engines, machines, tools, and other appliances. There will be shortly opened showrooms and stores by Messrs. Macbeth Bros. & Co. in Clare Road and Messrs. John Hetherington and Sons are also preparing showrooms for displaying their numerous manufactures, and it is not unlikely that others may follow the example which has stimulated business so much in other cities. The favourable prospects of trade in machinery and millwork have been foreseen by the more enterprising firms and the number of cold-weather tourists representing manufacturers justifies the expectation of good business during the year."

The Bombay Plan: Part Two

EXACTLY a year ago we commented in these pages on the first part of a 15-year plan for the economic development of India, drawn up by Sir Purshotamdas Thakurdas, Sir Ardeshir Dalal, Sir Shri Ram, Mr. J. R. D. Tata, Mr. Kasturbhai Lalbhai, Mr. G. D. Birla, Mr. A. D. Shroff and Dr. John Matthai. While the first part dealt with the problem of increasing national production, the second part, released last month, tackles the questions of distribution and the role of the State. It is signed by all of the original signatories except Sir Ardeshir Dalal, who has since joined the Government of India as Member for Planning and Development. But Sir Ardeshir had been closely associated with the drawing up of this part also before he took up office, and he has declared that the aims of the Bombay planners and the Government of India are the same, viz., raising the standard of living of the average man; we can also trace a certain similarity of thought between the second part of the Bombay plan and the second report of the Reconstruction Committee of the Viceroy's Executive Council.

Improvement in the standard of living of the masses being the object of all planning, it involves both increased production and equitable distribution. Equitable distribution will secure to every person a minimum income essential for a reasonable standard of living—a basic minimum allowing for variations in income according to ability and productivity—, and it will prevent or reduce gross inequalities in the incomes of the different classes and individuals. Two classes of measures are necessary to secure a minimum standard of living: raising the general level of income and reducing the cost of living. It is proposed to raise the general level of income by the provision of full employment, increase in efficiency, and improvement in wages. Providing full employment means "ensuring for every person suitable opportunities for earning his or her livelihood." In order to achieve this, a smaller measure of capital per worker than elsewhere has been suggested, as well as the fullest possible development of small-scale and cottage industries. Similarly, the provision of work for seasonal unemployment in agriculture being of great importance, the Bombay plan recommends the provision of subsidiary industries like spinning and weaving which the cultivator can take up when he has no work on the farm. It proposes to bring about increased all-round efficiency by the spread of general and technical education among the workers. Small-scale and cottage industries will be better organized, and cheap electricity and improved tools will be made available to them. Under a system of decentralized production the benefits of higher efficiency will go to the small-scale producer, who will be assured of a corresponding increase in his income. As to raising the general level of wages, the plan realizes that the establishment of a basic minimum wage for all occupations is out of the question, but that a beginning may be made in certain well-established industries like cotton textiles, sugar and cement. It is laid down that in the beginning the minimum below which wages should not be allowed to fall should be related to the normal wage-level prevailing in the industry, and that the minimum should be revised from time to time, until it corresponds with a reasonable standard of living, by standing committees composed of representatives of employers, workers, and a few independent persons.

While the suggestions made so far are calculated to increase the incomes of those below the subsistence level, the proposals put forward for reducing the cost of living fall under two different categories, viz., the provision of free social services like medical treatment and education, and the provision, at low cost, of essential utility services like electricity and transport. In order that their cost to the consumer might be as low as possible and within the means of the bulk of the population, they will be subsidized to the necessary extent by the State. To provide for unforeseen causes like monsoon failures, however, a national relief fund will be started and utilized at need. These, it is admitted, do not, of course, provide a complete scheme of social security. They do not touch contingencies such as sickness, old age and technological unemployment, which can be met only by a comprehensive scheme of social insurance which the plan rules out "until a policy of full employment has had time to work itself out and some approximation is made to a position of stable employment for the greater part of the population and until the average individual income has risen sufficiently to meet the contributions necessary under a scheme of social insurance." It is suggested, however, that, as in the case of minimum wages, a beginning may be made in the direction of social insurance by introducing sickness insurance and holidays with pay for workers in organized industries.

Attempts to ensure a minimum standard of living to everybody will incidentally bring in its wake a certain reduction in the inequalities of income of the different classes and individuals. But more positive steps, the plan recognizes, are called for. A wider distribution of the shares of joint-stock companies, development of the co-operative movement and regulation of interest rates and profits are indicated. It is also recognized that the most effective method of preventing gross inequalities is direct taxation, which is necessary if India is to meet the increased costs of administration arising from planning, the cost of social services like education and medical treatment and of subsidies for essential utility services. Most important of all is the provision for State control, accompanied in suitable cases by ownership or management, of public utilities, basic industries, monopolies, industries using or producing scarce natural resources and industries receiving State aid. Control, it is said, may be in the form of fixation of prices, limitation of dividends, laying down conditions of work and wages for labour, nomination of Government directors, and licensing. In the case of enterprises important to public welfare or security which are owned by the State, public interest will be the only consideration governing the issue whether State-ownership and control should also be augmented by State management.

It will be evident, therefore, that the continuation, and in some directions the more rigorous enforcement, of controls that is implicit in any scheme of economic planning will necessitate the enlargement of the positive and preventive functions of the State in the economic sphere. It is also taken for granted that the various controls will not be effective unless the State, which is the central directing authority, has a specialized agency for handling economic matters, and this agency is to be supplied by an Economic Civil Service composed of persons with the appropriate education, training and experience. Having gone so far, the plan clearly defines the nature of the central directing authority, the regional distribution of economic activities and the system of society in which those activities are to be pursued. Both the plan and the proposals for meeting its cost imply the existence of a responsible national Government as an essential condition. Any programme of economic development, moreover, should include the whole of India, British as well as Indian, and progress should be so planned that the targets as well as the pace fixed for the plan should have uniform application throughout the country; otherwise a proper regional distribution of industrial activities will become impossible. As to the system of society considered desirable for carrying through its recommendations, the plan envisages a combination of the principles associated with both capitalism and socialism because "capitalism, in so far as it affords a scope for individual enterprise and the exercise of individual initiative, has a very important contribution to make to the economic development of India."

The first part of the Bombay plan received a good Press if for no other reason than that it really set the ball rolling; the second and concluding part has been received even more enthusiastically, because the framers of the plan, pre-eminent captains of industry as they are, have squarely faced the vexed problems of distribution, of Capitalism *vs.* Socialism, and of State control *vs.* private enterprise. It augurs well for the future that the Government of India have already made a beginning with respect to some of the proposals contained in the plan, for the fact that a national Government is necessary for putting into effect all its proposals can be no reason for remaining idle.

Towards Stabilisation...

Since January 1941 prices of commodities in the textile trade, such as cotton, mill-stores, wages, grain and cloth, began to rise at an abnormal rate, reaching the peak level some time in March 1943. The control measures undertaken by the Government of India in conjunction with the Textile Control Board then began to have a restraining effect and gradual reduction has since taken place. As will be seen from the graph opposite, the curves are now tending to run together, indicating that relative price stability is slowly being reached.

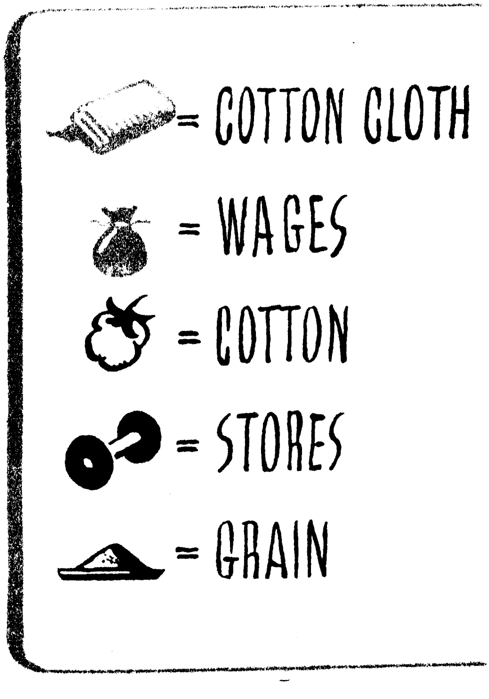
THE graph shows the variations in the cost of mill-stores, wages and cotton to all mills, and of cloth and grain to the consumer, taking as the basis the rates ruling in January-February-March 1941 as 100. Thus 200 on the vertical scale represents a rise of 100 per cent., 300, a rise of 200 per cent. and so on.

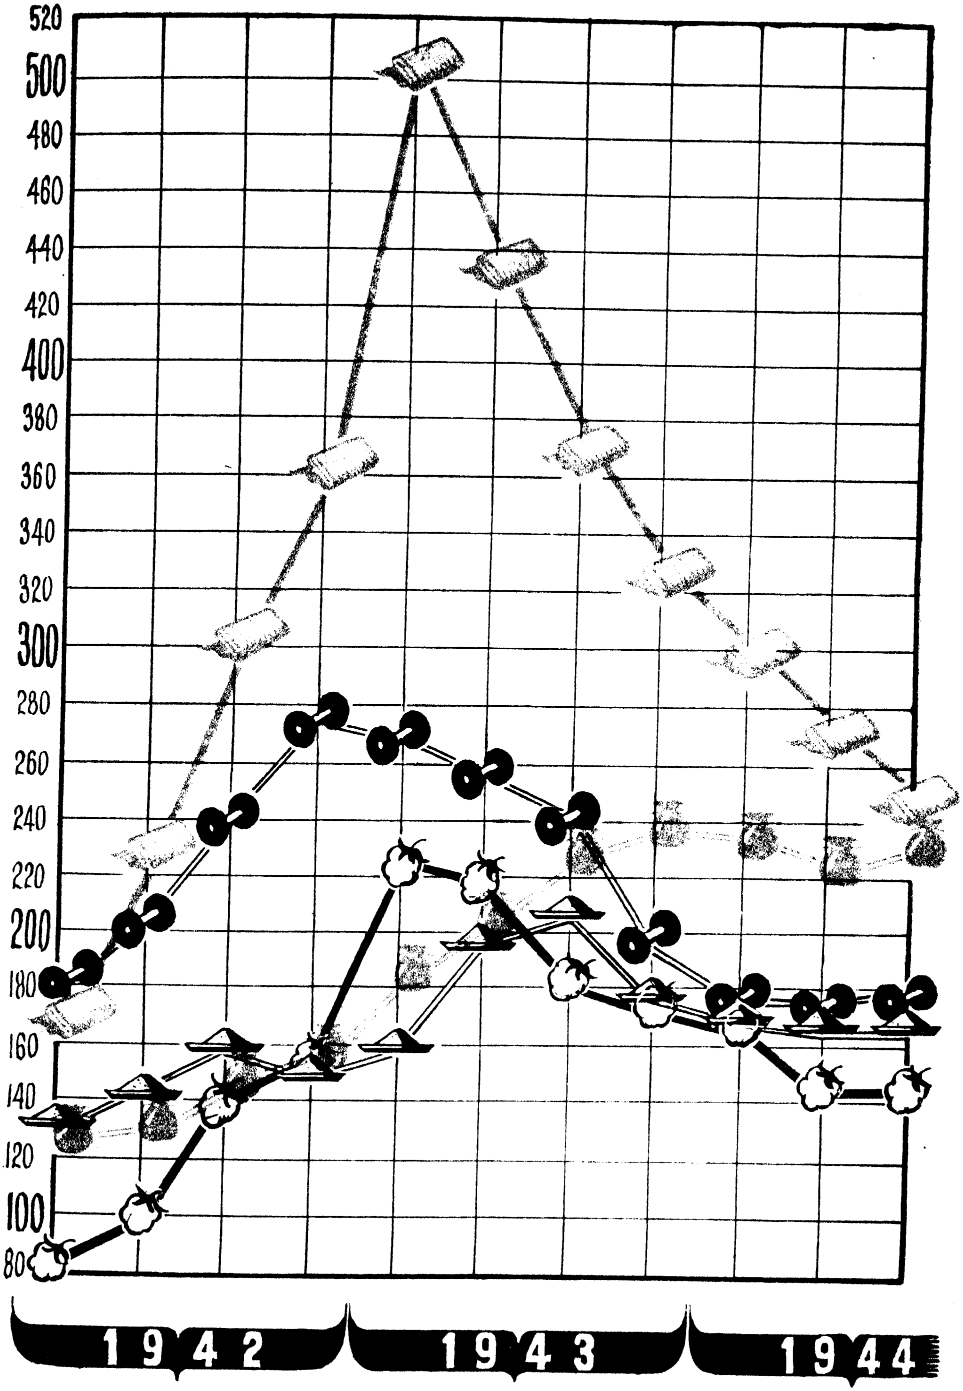
The cloth curve is based on the current market rate for a typical leopard cloth, the wages curve has been taken from several sources while the cotton curve is based on the price of a typical mill mixing. The stores curve refers to mill-stores and is based on representative figures obtained from reliable sources. As regards the grain curve, the price of rice in Bombay City published in the *Bombay Labour Gazette* has been taken as the basis.

It will be noticed that the graph clearly reflects the effects of the various price control measures taken by Government. Whereas the cost of mill-stores had risen before control by 175 per cent. over the basic cost, it fell to 80 per cent. above the basic cost in the quarter August-September-October 1944. Similarly, before the introduction of control, the costs of raw cotton and cotton cloth had risen by 125 per cent. and 400 per cent. respectively, over the basic costs. But in the quarter August-September-October 1944 they marked a rise of only 45 per cent. and 145 per cent. respectively over the basic cost.

In the basic quarter, January-February-March 1941, when the cost of the several items is taken as 100, it is estimated that mill-stores cost about Rs. 3 crores: raw cotton about Rs. 19 crores and cotton cloth about Rs. 18 crores. In the quarter immediately preceding the introduction of control over mill-stores, their cost had gone up to about Rs. 8 crores but is believed to have fallen to a little over Rs. 5 crores in the quarter August-September-October 1944. Similarly, in the quarter immediately preceding the introduction of control over raw cotton and cotton cloth, their costs had reached the peak levels of roughly Rs. 43 crores and Rs. 89 crores, respectively. In the quarter, August-September-October 1944, however, these figures are believed to have come down to Rs. 27 crores and Rs. 44 crores respectively.

While it is not claimed that black markets in cloth and yarn have disappeared as a result of the control measures, it is clear that considerable improvement in the situation has taken place since the introduction of control.





The vertical scale indicates the percentage variations in the cost of the different items. The horizontal scale indicates the different quarters of the year, commencing from February-March-April 1942 and ending with August-September-October 1944.

Hand Spinning in the Madras Presidency

BY V. G. RAMAKRISHNA AIYER, M.A., L.T.

(Specially Contributed)

IN almost all the districts of the province of Madras, hand spinning is still carried on as a subsidiary occupation. The agriculturists prefer to clothe themselves in rough and coarse garments made of cotton grown in their fields and there is a demand for hand-spun yarn for making clothes. The industry has been carried on in certain places from time immemorial as a hereditary occupation, in which case it is almost always followed as a subsidiary occupation, and in other places it owes its existence to the activities of the All-India Spinners' Association and *khaddar* propagandists where, of course, the occupation is generally whole time.

The industry as at present carried on does not, owing to several causes, pay the worker adequately for the labour and trouble involved and at the utmost the earnings of a spinner do not exceed two annas per diem at the most favourable estimate. The yarn produced is, except in very rare cases, very coarse and uneven. The disadvantages to the weaver using it are its comparative high price in relation to the price of mill-made yarn, intermittent supplies owing to the carrying on of the industry in scattered localities and, last but not least, its poor quality, causing the weaver losses and troubles and necessitating occasional stoppages of the operation of the loom. The use of the spinning wheel is easily and quickly learnt but the ability to make good, even, yarn without weak patches or unsightly enlargements at intervals, or to spin for warp or weft as may be required, can be attained only after long and arduous practice. There seems little doubt that from the point of view of economic production the use of machine-made yarn has nearly everything to recommend it, as it is cheaper and more easily obtained and further better adapted, being stronger and more useful for use on looms. There might be a case for the weavers to strike a via media course by adopting mill yarn for warp and hand-spun yarn for weft as, if proper care is exercised, there should not be any considerable shrinking.

Imperfections of the "Charka"

The difficulty in regard to hand-spun yarn is largely due to the imperfections of the spinning wheel. The *charka*, besides throwing a good amount of work on the spinner, has the following among other disadvantages:—(1) Intermittent twisting and winding, (2) necessity for the use of both hands, (3) smallness of output, (4) it attempts only one out of the several operations in the process of transformation of cotton into yarn and there is no simultaneous arrangement for carding, drawing, etc., (5) the yarn (cotton) spun on the *charka* does not always easily stand the strain of fly-shuttle looms.

The spinning wheel was originally used in Europe for spinning flax, hemp and other hard fibres of a longer staple and after cotton also began to be spun on it, the improvements on the *charka* were mainly stimulated by the larger demand for stronger yarn that would stand the strain of the fly-shuttle loom invented by Mr. Kay. This will show that the future of hand spinning is largely dependent on the extent to which fly-shuttle slays are in use in the country. The scope for the utilization of hand-spun yarn gets diminished with the increasing use of fly-shuttle slays by the weaving community.

Even the so-called improved *charkas* are not really improvements over the ordinary spinning wheel and they do not even give greater outturn, although the cost involved is higher and the irregularity is at least as great. Whatever may be the result of the endeavours to evolve an improved *charka*, those who are interested in the industry should not overlook the problem of evolving a machine for preparing uniform and good slivers. If such a machine could be evolved, it would help the industry considerably.

Hand-spun yarn, besides being weak, is also more costly than mill yarn and the weaver's preference for mill yarn is mainly decided by this factor. The weaver usually demands a higher wage for weaving hand-spun yarn and gets it too. It is true that such of the weavers as have taken to *khaddar* weaving are, besides getting higher wages, more regularly employed than those depending on mill yarn, but this circumstance is largely attributable to the limited number of weavers taking to the weaving of hand-spun yarn and also to the fact that they are usually engaged by organized associations.

We may now compare the prices of mill yarn and hand-spun yarn of two different counts in a normal year in this province.

For 10*s*.

	Rs.	a.	p.
4 viss of unginned cotton costs	1	8	0
Ginning charges	0	3	6
	1	11	6
Deduct cost of seed separated from 3 viss	0	6	0
	1	5	6
Charges for carding and sliver making for 1 viss or 3 lbs.	0	3	0
	1	8	6
Loss in carding	0	1	0
	1	9	6
Charges for spinning, Re. 1 per viss	1	0	0
Cost of yarn 1 viss or 3 lbs.	2	9	6
Cost of yarn, 1 lb.	0	14	0
Cost of yarn, 10 lbs.	8	12	0

The cost of mill-made yarn 12s is about Rs. 6-4-0 to Rs. 6-8-0.

For 40*s*.

(Forty hanks make 1 lb. if the yarn be 40s.)

	Rs.	a.	p.
Cost of cotton 1⅛ lb. including wastage	0	12	0
Coolie for spinning	2	8	0
	3	4	0
Value of 10 lbs. of hand-spun yarn	32	8	0
But mill-made yarn of 10 lbs. costs	11	2	0
Difference in price	21	6	0

In Tiruppur, which is one of the principal centres of hand-spinning, the Khaddar Stores pay Re. 1 per lb. of yarn of 8s to 12s on the following basis:

	Rs.	a.	p.
Cost of 1 lb. of ginned cotton	0	10	0
Wages for spinning	0	5	0
Commission for the collecting agent	0	0	9
Wastage	0	0	3
Total	1	0	0

The following statement shows the difference in the prices of mill and hand-spun yarn:

Count of yarn	Price of hand-spun yarn	Price of mill-spun yarn.
10s to 12s	Annas 13 to 14	As 8 to 10.
20s	Rs. 1-8-0	Less than Re. 1
30s	Rs. 1-14-0	Less than Rs. 1-2-0

If we compare the prices of cloths made in a mill with those made by a weaver out of hand-spun yarn the following statement would indicate the difference between the two:—

Cost of manufacture of a lb.

Mill cloth	Pies.
Coal	10.09
Stores	14.46
Labour	39.69
Office and supervision	3.41
Fire insurance	1.67
Municipal and other taxes	1.57
Interest	5.66
Commission on cloth	4.60
Agent's commission	0.83
Income-tax and super-tax	1.04
Total	83.92
	i.e., Annas 7.

Hand-made cloth.	Rs.	a.	p.
Carder's wage	0	1	0
Spinner's wage	0	3	0
Weaver's wage	0	7	6
Depreciation in materials	0	0	6
Total	0	12	0

The foregoing statistics of production show that the production of hand-spun yarn and cloths from such yarn is decidedly costlier and this fact is even admitted by *khaddar* enthusiasts.

Economics of Hand-spinning

Opinion is divided on the question of the economics of hand-spinning. There is no doubt that sentiment plays a larger part wherever preference is shown to hand-spun and hand-woven cloth, as the cost of this cloth is definitely higher than that of hand-woven cloth produced out of mill yarn. But it is under present conditions the only means of adding to the meagre earnings of the ordinary agriculturist, if he takes to it for want of a more suitable subsidiary occupation. Ordinarily he grows his cotton, his womenfolk are not alien to the art of spinning and in the village domestic economy, he finds his coarse cloths more suitable to his taste and calling. To the old and infirm and to those who could find no better occupation, however meagre might be the earnings, it is a substantial addition to the family income in the absence of a more agreeable occupation suitable to the social status of the different classes of people. Hand spinning has its own merit. Industries like coir spinning, palmyra plaiting, etc., which give no better income, are still carried on and, compared to them, hand spinning is more homely and dignified. The industry involves so little initial outlay and the mechanism of the *charka* is so simple that an ordinary carpenter could prepare it without much labour. Although the occupation may be monotonous, it does not demand any physical strength beyond staying power.

In the province of Madras, the Government could encourage the industry in the following directions:—

(1) By the evolution of an improved *charka*, if necessary, by offering rewards for the most successful invention.

(2) By improving the hand-ginning machine and the carding bow.

(3) By arranging for the supply of good cotton to the spinners at important centres, and, if possible, in carded form.

(4) By standardizing counts and hanks.

(5) By supplying *charkas* and other appliances on hire purchase system.

(6) By purchasing Government requirements of cloth in *khadi* as far as possible. The local bodies could also help the industry by introducing spinning as a subject of study in schools.

◆

Future Markets for British Textiles

WRITING on the subject of markets for British textiles in the future in the *Textile Mercury and Argus*, " Exporter " says:—

" The already well developed textile industries in countries which were big markets for British goods have increased so much during five years of war that it is advisable for British manufacturers to consider what future needs are likely to be.

Latin America, Australia, Canada and India have their own textile industries covering the entire process from spinning to finishing and making-up, and what is even more important, they are producing so much more than their own requirements that they are competing with us for export to smaller markets in their own spheres of influence to which freight costs are less for them than for us.

India, as a rapidly expanding cotton growing country naturally commenced to manufacture, mixing imported cotton with her own coarse staple. This admittedly caters only for low class trade but that is the bulk Indian market and the capacity of the industry is growing rapidly towards total needs.

The major markets for cheap and medium piecegoods are lost to us for ever, therefore we must sell them high-grade goods they cannot produce themselves. Many markets, large and small, have also been lost for made-up garments. Only by reciprocal trade which will raise the local standard of living can we hope to get them back in some part.

Whether greater productivity within the industry can be allied to high quality is a matter for the technician, but it is certain that lower production costs are necessary if we are to expand the sales of high-grade cloth by bringing it within the means of a wider public.

There is still time and scope for Great Britain to become a larger rayon producing country than previously by the seizure of German and Italian markets before those countries can get into production again. There are also the pre-war markets of the Japanese rayon trade.

Just as rayon came to the rescue of a diminishing cotton industry after the last war, so after this one will come plastics. Research into the making of plastic textiles has made a big advance, though it is suspected that the United States are much ahead of us, and their potentialities are as yet little realized."

Indian Central Cotton Committee

Half-yearly Meeting in Bombay

THE half-yearly meetings of the Indian Central Cotton Committee began on the 22nd January and concluded on the 27th January 1945, Mr. H. R. Stewart, C.I.E., Vice-Chairman, Imperial Council of Agricultural Research, presiding.

Sir Chunilal B. Mehta was re-elected Vice-President for 1944-45 and the various Sub-Committees for the year were constituted.

Considerable discussion took place on the subject dealing with the part cotton should play in the post-war planning of agricultural production. In this connection, the Committee had before it the report of a Special Sub-Committee which was appointed to examine this subject and make recommendations. It was revealed that Provincial Governments and Indian States had already reduced or proposed to reduce in the current year the acreage under cotton by 2,000,000 acres as against 3,100,000 acres (2,000,000, under short staple, and 1,100,000 under low grade medium staple) suggested by the Committee. In the opinion of the Committee the target to be aimed at was a cotton acreage not exceeding 16,100,000 acres next year as against 19,200,000 acres in 1942-43. To implement the plan certain recommendations were made which included the stoppage of irrigation water for short-staple cotton production in canal-irrigated tracts, the reduction of the cotton acreage by compulsion, where necessary, and, the prohibition of the mixing of cotton in ginning and pressing factories by legislation. It was agreed that Provinces and States which are compelled to reduce the area under cotton and which, as a consequence, will not produce sufficient cotton seed for cattle feed should be allowed to import cotton seed freely from surplus cotton seed areas.

Subsidy on American Cotton Exports

The position arising from the proposed grant of a subsidy on American cotton exports was considered and it was decided that, in view of its adverse effect on Indian cotton, the Government of India should be requested to take up the matter with the U.S.A. administration through His Majesty's Government, and that in the event of any International Cotton Conference being held to consider this matter, a representative from India should be appointed to it in consultation with the Indian Central Cotton Committee.

Appreciative references were made to the valuable work done by Sir Chunilal B. Mehta in the interests of Indian cotton and the Indian cotton grower during his recent visit to the U.S.A. as the leader of the Indian delegation to the International Business Conference.

The financial position of the Committee was examined and, in order to enable the Committee to extend its sphere of activities, especially in the post-war period, it was decided that a recommendation should be made to the Government of India for an increase in the cotton cess from 2 annas to 4 annas on every bale of cotton exported or brought under process in a mill. It was also suggested that Indian States should be addressed to fall in line with British India in this respect.

A resolution was passed recommending that steps should be taken for the early import of new or reconditioned textile machinery from the U.S.A. or the U.K. in order to solve the twin problems of reducing the large surplus of short-staple cotton and relieving the general shortage of cloth and yarn in the country. The resolution further urged that concessions in the matter of taxation should be afforded to mills.

The desirability was stressed of continuing, as a permanent feature of cotton statistics, the compilation of statistics of Indian mill consumption and the stocks and receipts at mills of Indian and foreign cotton by varieties, which are at present required to be furnished compulsorily under the Defence of India Rules to the Cotton Movements Committee, and it was decided to address the Government of India in the matter.

New Schemes

The progress and final reports on certain schemes financed by the Committee were examined and recommendations made regarding future lines of work. The new schemes sanctioned by the Committee were:—Scheme for the distribution of seed of M4 (a new early type) on the right and left banks of the Indus, the scheme for distribution of 'Suyog' (substitute for 1027 A.L.F.) in Navsari District of Baroda, the scheme for multiplication and distribution of an Asiatic strain Sel. 69 and he Mysore-American strain M.A.V. in Mysore State. A revised scheme for manurial trials in Sind was also sanctioned. The Committee also agreed to the extension of the following schemes for varying periods:—Scheme for the cultivation of 1027 A.L.F. in Nawapur taluka in West Khandesh, scheme for the improvement of the red tinted Cocanadas cotton in Madras Province and the scheme for the grading and marking of 1027 A.L.F. and Suyog cottons in Surat District.

The Effect of Storage on Indian Cottons

Results of Experiments on *Broach Deshi 8*

THE present paper* gives an account of the effect of storage, under certain specified conditions, on some of the important properties of Indian cottons. The conditions of storage were, (1) Bombay weather, (2) controlled humidities at room temperature and at a constant temperature, and (3) controlled humidity combined with watering of cotton. The characters studied were (1) fibre-strength, (2) incidence of infection, and (3) shade of cotton. In addition, tests were also made on fibre length, fibre weight per inch and the spinning quality of the cotton. The following conclusions are drawn from the results:—

(1) Broach Deshi 8, when stored in Bombay for 2½ years in the form of a bale, showed distinct signs of deterioration in quality, as indicated by the following features: (*a*) decrease in staple-length, which, unless it was due to sampling, could be attributed to the internal corrosion of the fibres which helped in their rupture in repeated opening and repressing of the bale; (*b*) increase in the number of yarn breakages in the ring frame; (*c*) a downward trend in yarn strength; and (*d*) increase in fungal damage to fibres. The extensibility of the yarn was found to increase slightly with storage of cotton.

(2) Storage in desiccators at controlled humidities below 90 per cent. R. H. did not lead to any deterioration in bundle-strength over a period of two years, but at saturated humidity the deterioration was so rapid that both Broach Palej and Broach Deshi 8 decayed completely in four to five months.

(3) Storage at humidities immediately above 90 per cent. R.H. resulted in loss in strength, the loss being more rapid at higher than at lower humidities. Thus, the critical limit lay between 90 and 92 per cent. R.H. The rate of decay increased even with a small increase in storage humidity above 90 per cent. R.H.

(4) The incidence of infection was significantly lower for Broach Deshi 8 than for Broach Palej, and there was a significant increase in the percentage of infected fibres in samples stored at 75 per cent. R.H. and higher humidities.

(5) Broach Deshi 8 was slightly whiter in shade than Broach Palej; the shade remained unaffected in storage at 60 and 75 per cent. R.H. for a period of two years, but at 90 per cent. R.H. and higher humidities the shade of both cottons deteriorated gradually.

(6) Strength tests on small samples stored for two years in petri dishes for shade measurements showed that even at 75 per cent. R.H. there was a loss in strength especially in the lower half of the sample. The reason for this loss in strength, which was not shown by the samples stored in desiccators, was found in the accumulation of moisture in the samples in the petri dishes.

(7) Storage for 1½ years at different humidities and a constant temperature of 92°F. did not lead to any decrease in strength or increase in incidence of infection, showing the important role of temperature as a controlling factor for fungal growth. The success of a comparatively low temperature in arresting fungal growth was probably due to absence of any water in the desiccators. This result brings out the importance of storing the cotton in a dry godown.

(8) When cotton is wetted with localized watering, as by the sprinkling or spraying of water, it always results in a loss in strength and shade in the damped region. The loss in strength increases rapidly with the humidity of the atmosphere in which the cotton is stored, and it generally goes hand in hand with increase in fungal infection of fibres. The evil effect of adding water to cotton before pressing it on the ground that dry cotton would not press well, is clearly brought out by these results.

(9) Addition of 0.5 to 1 per cent. of formalin of correct commercial concentration to water was found to be quite efficacious in checking the deterioration of cotton on storage. We must, however, make it quite clear that we are not at all in favour of watering cotton in any form whatever, but, if it is indispensable, its evil effects can be greatly reduced by the use of the above-mentioned antiseptic.

Bichromate Manufacture in India

All-India Association Formed

WITH a view to forming an All-India Bichromate Manufacturers' Association, a conference of the trade interests concerned was convened on Friday 2nd February at the Indian Merchants' Chamber, Bombay, under the presidentship of Mr. J. C. Setalvad, President of the Federation of Indian Chambers of Commerce and Industry. The following are extracts from the welcome speech delivered on the occasion by Mr. B. S. Lalkaka, Chairman, Bombay Bichromate Manufacturers' Association:—

" Sodium and potassium bichromates are mainly required in khaki dyeing, leather tanning, and for the match industry, besides other minor uses as also for the production of several useful chemicals like chromium sulphate, chromic acid, chrome alum and for making chrome pigments like chromium oxide green, etc.

" The principal raw material needed for this manufacture is chrome ore, mineral available in great abundance in the Mysore State and at Chaibasa in Central India and on the borders of Baluchistan and elsewhere, which before the war used to be exported to foreign countries in large quantities to be returned to us as a finished product. It is a matter of great pride and satisfaction to us as manufacturers of bichromates that due to the impetus given by the war and certain favourable circumstances, we have been enabled to step into the breach and to fill in the void created by the cessation of imports from abroad owing to lack of shipping and other difficulties in the path of the Government.

" Amongst other raw materials needed are soda ash, lime, sulphuric acid, fuel oil and/or coal, which could be easily available in India.

" The average normal consumption of bichromates in India before the war may be taken roughly at about 3,000 tons per annum. But due to the large requirements of the military for khaki cloth and for tanned leather, etc., the demand went up by leaps and bounds and almost doubled itself in war-time. This had to be met anyhow and as only limited supplies were available from the United Kingdom, large quantities had to be imported from the United States of America under Lend-Lease, in spite of the acute shipping position, which no doubt created a rather serious situation for the Government.

" It was in these circumstances that the Government of India in the Commerce Department had to turn their attention very seriously to production in our own country to fill the gap, and this is how the bichromate industry came to be started and established here in the year 1941-42 at the sole request and desire of the Government and under promise of full support and protection at the proper time from no less an authority than the Hon'ble Sir Ramaswamy Mudaliar, the then Commerce Member, on the condition that the affairs of the industry would be conducted in an efficient and business-like manner so as not to be a burden on the country.

" Several factories in various parts of India were started, e.g., in Bombay, Madras, Mysore, Calcutta, Cawnpore, etc., of which some have already shut down, being unable to stand the stress and strain of altered circumstances. A Chrome Compounds Control Order was also promulgated and rates contracts were entered into between the Government and the respective suppliers after detailed examination of the accounts by a Government costing officer of the Finance Department, in order to regulate the production, sale and costs of the indigenous manufacture. Be it said to their credit that upto now we have received fair treatment on the whole from the Government Supply Department, both in the matter of sales and distribution as well as in the procurement of any raw materials and equipment necessary for economic production.

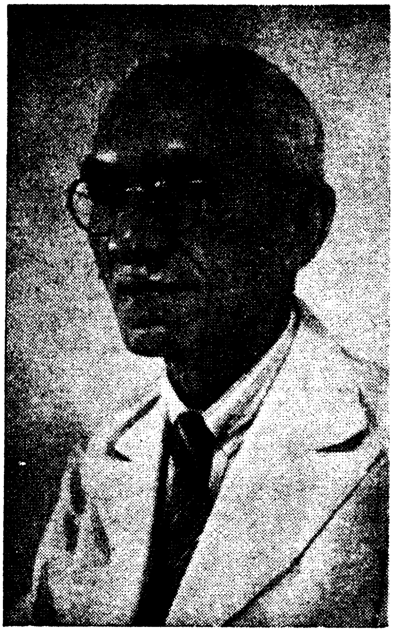
" It may also be added that having regard to the importance of the bichromate industry to India, the Government even thought it fit to depute Dr. N. R. Damle, Industrial Chemist to the Bombay Industries' Department, to England and America to study bichromate manufacture in those countries with a view to giving the benefit of his help and guidance to the local manufacturers.

"So far so good. But, with the possible end of the European war in sight, signs are not wanting to indicate that wherever and whenever possible, the interests of the big nations with international cartels will prevail to the detriment of their less advanced confreres and unless we Indian manufacturers also pull together and take concerted action our cry will be like one in the wilderness.

"These considerations originally led the Bombay bichromate manufacturers to form themselves into a local association to protect their interests and this association, I am glad to say, has even been recognized by the Government of India in the Supply Department.

"We have, however, reached a stage when from humble beginnings, the puny infant has grown into a lusty child that demands further space for expansion, particularly in view of the fact that our industry has now grown and can even claim to meet the whole of the country's requirements—price for price and quality for quality—provided we have also equal facilities and cheap raw materials at our disposal. The time has therefore come for us to formulate our demands before the Government to *stop all imports* and to implement their solemn pledges of giving us adequate support to enable us to withstand any ruthless competition which is bound to arise very soon, by devising ways and means in due consultation with the interests concerned.

"This is why it is thought imperative that an All-India Bichromate Manufacturers' Association may be formed with the goodwill and support of all those present here."



Mr. Behramji S. Lalkaka.

President's Speech

The following are extracts from the presidential speech of Mr. J. C. Setalvad:—

"The bichromate industry is one of those industries which were encouraged by Government in the early stages of the war when foreign imports became unavailable for the successful prosecution of the war. It is but fair, therefore, that the industrialists concerned should look to Government for necessary protection at a crucial time when their need was most urgent. If we are not organized to meet the danger that is before us, many industries will have to go to the wall. At this crucial moment all industries have to combine and put their heads together to solve their immediate problems and you could be no exception. You have wisely gathered in this conference to come to a decision regarding the formation of an all-India association of your trade. Most of the industries started during the last war went to the wall as a result of Government apathy in formulating any policy for the encouragement of nascent industries. Government should not be allowed to follow that policy again. With all the sympathies that the Government of India are expected to have in regard to industrialization of India, they have many limitations which, if not countered by the industrialists of this country, would react very unfavourably on the entire economy of this country. Fiscal autonomy exercised in the interests of India would mean the raising or lowering of the tariff walls to suit the needs of Indian industries, and India's interests demand that bounties and subsidies should also be made available."

Resolutions

The following resolutions were moved at the conference by Mr. Purshotamdass Popatlal, Managing Director of the Pioneer Chromate Works Ltd., and they were duly seconded and supported.

"This Conference of All-India Bichromate Manufacturers notes the assurances given from time to time by the Government of India about protection to the bichromate industry and desires that:

(*a*) So long as the production of bichromates is regularly continued and grows in strength to be able adequately to cope with the growing demand in India, imports must either be stopped or so regulated that the indigenous production does not suffer or is not wiped out of existence.

(*b*) Pending establishment of a permanent Tariff Board, the Government of India should consider favourably a rebate of import duty on soda ash and fuel oil used in this industry.

(*c*) Now that the indigenous bichromate industry can meet all requirements, use of alternative dyes or other substitutes for dyeing khaki cloth which would displace the use of bichromates should be stopped as a measure of protection to this industry."

"This Conference requests the Government that for economic stabilization and expansion of the bichromate industry on planned and national basis, encouragement should be given for the manufacture of other chromium compounds such as chromium sulphate, chrome pigments, chromium oxide green, chromic acid, chrome alum, etc., for the manufacture of which bichromate is an essential raw material, and also for the manufacture of by-products such as sodium sulphide, sodium sulphate, etc."

"In view of the possibility of the existing production in India becoming surplus during post-war period, due to reduced demands of khaki cloth, this conference requests the Government of India to arrange for export markets in the Middle and Far East countries. While negotiating trade agreements with neighbouring countries, provision should be made for such exportable surplus of Indian bichromates."

"This conference requests the Government of India to control new ventures for the manufacture of bichromates in India taking into account the existing production."

"This conference views with concern some of the recent measures adopted by the Advisory Committee of Dyes and Chemicals of the Textile Board in so far as they have adopted the use of vat and sulphur dyes, which are not indigenous products for khaki colour, thereby displacing the use of bichromates to that extent. It also requests the Textile Commissioner to provide for representation of the bichromate industry on the Chemicals and Dyes Committee to watch the interests of the industry."

"This conference resolves that the numerous announcements of the Government of India assuring protection to bichromate industry should be confirmed by a statutory enactment providing for ample protection, thereby supporting the efforts to put it on a sound and economic basis."

"This conference resolves that an All-India Bichromate Manufacturers' Association be and is hereby formed with its registered office in Bombay and that a committee be and is hereby appointed to prepare a constitution for the Association."

All-India Bobbin Manufacturers' Association Bombay

AT the instance of some leading manufacturers of bobbins in India, a meeting of bobbin manufacturers was convened on 16th December 1944 at the Indian Merchants' Chamber Hall, Churchgate, Bombay, to consider the advisability of their forming into an association for advancing and protecting the interests of the Indian bobbin industry and to stabilize the industry. The bobbin industry in India at the moment is not protected or recognized as an important indigenous industry. Manufacturers have been operating under hardships and are not getting suitable raw materials owing to various difficulties.

At the first meeting, it was resolved to form an association and a sub-committee was appointed to draft a constitution and circulate it. The members again assembled at the Indian Merchants' Chamber Hall on 6th and 8th January, 1945, when they discussed and finally approved of the constitution. Three members were appointed as provisional trustees (1) to receive membership fees, (2) to open a banking account, (3) to get the constitution signed by the founders and other members willing to join, (4) to get copies of the constitution printed and to circulate the same to bobbin manufacturers in India and invite them to join and (5) to hold a first general meeting of the Association for the election of office-bearers in the first week of March 1945. The members who have joined hope that other manufacturers of bobbins all over India will join and give their wholehearted support to the Association now formed. Full particulars about the Association can be had from the All-India Bobbin Manufacturers' Association, No. 5, Ali Chambers, Tamarind Lane, Fort, Bombay.

University Department of Chemical Technology

Sir Homi Mehta's Address at Annual Gathering

THE tenth annual gathering of the Department of Chemical Technology, University of Bombay, was held on the 24th January 1945, with Sir Homi Mehta as chief guest. In welcoming Sir Homi Mehta and the other guests to the function, Dr. K. Venkataraman, Director of the Department, said that he was glad to have the opportunity of personally conveying to Sir Homi Mehta the thanks of the students and staff of the Department for his munificent endowment, which has enabled the University to institute Readerships in Oils, Fats and Soaps, and Plastics, Paints and Varnishes, and to equip the sections of Oils, Fats and Soaps and Foods and Drugs. Two other events of the year were the endowments from the Millowners' Association, Bombay, and the Topiwalla Trust, the former for work in textile chemistry and dyestuff technology, and the latter for constructing and equipping a pharmacy laboratory.

Sir Homi Mehta then addressed the gathering. Sir Homi said:

" I thank the Department of Technology for inviting me to be the chief guest at this gathering. It is worthy of note that in a comparatively short time this Department has rendered commendable service to the textile industry.

" I have always found that India was lagging behind in science and research to a very large extent. Why should it be? We have excellent talent in this country though it may be latent, but one thing is certain, that India can rise along with other countries in the world and can show its merit. There is large scope to produce great men as other countries have produced. That being so, it affords me great pleasure to see that this institution, with young men trained under such highly qualified professors, may have really a chance to do good to the country. If you can produce in ten years real talent, perhaps if not the whole of India, a greater part of the country will benefit. There are not many well-equipped scientific works in this country such as we find in America, Germany, England and other progressive countries. We have now made a beginning—perhaps it is a slow beginning, but a beginning has been made and it is within us to develop it to an extent by which we can come forward and play our own part against all other civilized countries.

" Our textile industry, in which you are greatly interested, is one of the oldest industries in this country. This industry requires a lot of young men who have gone through their examinations in scientific research, and who will have a great place in this country to develop the cotton industry on the same lines as Europe and other countries have developed. I am very sorry to say, though I am considered a cotton expert, that this country is far behind other civilized countries in the cotton industry, at least by 25 years. No one during all these years has paid any attention to research and scientific treatment of cotton. Perhaps there were no students like you at that time. In the beginning we were dependent upon the British coming out to this country for erecting cotton mills and managing them, the masters not knowing the A B C of the industry; and while these outsiders were paid fat salaries the industry paid little. Those who invested money got small returns—that was all. Nothing was taken very seriously and nothing was done on scientific lines; and the result is that after 50 years of our experience in the cotton industry, we are dependent on England and on Japan, and we have to ask the Government of India to find subsidy and to put up tariff walls against England and against Japan over 50 per cent. duty. That shows that we have merely wasted 60 to 70 years of our lives in this industry, and we are still continuing under 50 per cent. subsidy here to sell our goods in our own country.

" The curious fact is this—England does not produce even one pound of cotton, neither does Japan, and still they can compete by carrying the cotton either from America, Egypt or India to their own countries after paying freight and other expenses, and after working that cotton in their mills send us goods about 15 to 50 per cent. cheaper than we can produce. This is not a small thing; it is a very serious thing where millions of India's money have been engaged in this industry. Therefore, I depend upon you young men to come forward with their knowledge and help the industrialists who have money and who have already erected mills, to work them as their own and show their talent to such an extent that they should be taken as partners with a share in the profits. Owing to the present circumstances on account of the war, we had and we are having great advantage in our cotton industry. Well-established and well-managed mills which used to make a profit of 5 to 8 lakhs of rupees in the pre-war days are now making 70 to 80 lakhs a year. Huge profits have been made and huge profits are still recurring, but the profit is being carried away by the Government of India owing to the very high taxation in order to provide for the war. No less than 12 annas in the rupee go to taxation. That, being so, the industry cannot make great strides as one could have imagined. Still the profits are such that they are larger than before the war and, therefore, there is not much reason why the present-day advantage should not be availed of, and if a number of trained young men come forward and take charge of the departments and show how to run them properly, more money can be made in the post-war reconstruction of our cotton mills.

" First of all, cotton is a raw material. It is subdivided into hundreds of qualities ranging from ½" in length to 1" in India, in America from ⅞" to 1⅛" and in Egypt from 1" to 1¾". The misfortune of this country is that our agriculture also is hundreds of years behind. On one acre of soil in America they grow 280 lbs. of cotton, in Egypt they grow about 180 lbs. to 200 lbs. and India only produces between 75 and 80 lbs. They say labour is cheap and the holding of acreage is small, and, therefore, they cannot use mechanical appliances which are so largely used in America and other parts of the world. There may be some truth in this, but the greatest truth that we know is that India has been producing cotton not for dozens and hundreds of years, but for thousands of years. Consequently the soil is getting poorer and poorer every day and has actually become unfertile. The land is not well preserved and is not scientifically treated with proper manure and chemicals which are required to give good results. If things are allowed to go on as they are now, it is possible that after some time cotton growth may be extinct. Therefore, greater attention is to be paid to the agricultural side and I hope there would be mill magnates coming out to help agricultural institutions to make India a formidable country in agriculture. If the people depend on the Government of India and think that it should look after their interests, they are making the greatest mistake of their lives. There is no Government in the world who can do that. Men who have money must come forward to help agriculture and in that way develop the country.

" The selection of cotton is the first thing in a cotton mill for getting the best results in the finished goods. If this is not done scientifically, the whole structure falls to pieces. Cotton is the foundation on which rests the structure, that is the finished articles. Then come your departments of scientific bleaching and dyeing. People consider here that sizing is only an ordinary thing. They seem to think that just by mixing a little French chalk, china-clay and tallow they make a good sizing. No, sizing depends upon climatic conditions—you have to consider the climatic conditions. For the summer part of the year you require certain proportions and ingredients, in the monsoon the requirements are quite different, and in the winter these are different again. These things in England and Japan are not in the hands of the man who manages the mill, but it is in the hands of the scientists and research men who give formulæ for size mixings, which give a good weave and good cloth. Here in India they find fault with the poor labourers. The workers are not to be blamed, but the managers and others who have the charge of the mills, and they, instead of blaming themselves, blame the poor people.

" Bleaching and dyeing are highly scientific. Even to-day it is said that there is no country in the world to equal Lancashire which produces the best bleaching in the world. Some say that it is due to the special quality of the water, etc., which cannot be found anywhere else. Dyeing is also a highly technical subject, and you are all aware how Germany has risen—it has not made millions but tens of millions and hundreds of millions in dyes. For dyes which were 4 annas per lb. before the war broke out, you will be surprised to hear, we are now paying Rs. 90, and you can gauge how much it has risen. It is not 900, but 3,600 per cent. Why cannot India produce any dyes? If she produces something to-day, the next day she produces something else quite different. I hope your Department will recognize that, and by research provide young men who can revolutionize this industry.

" To-day, Europe, America and Japan are in the throes of this world war. Millions of young men between the ages of 20 and 30 are killed. The man who invented the first combustion engine is the greatest criminal of the world! They had invented it for doing good to the country, but to-day they are using these in all the aeroplanes which are doing such destruction in the world. Science can do immense good, but at the same time it can also produce things which can kill hundreds of thousands of people very quickly. Germany is building V-1 and V-2 bombs to destroy things not only over hundreds of miles away, but thousands of miles away, and America is afraid that these might come to New York even. Such are the inventions of this scientific world. Americans have built Super-fortresses which in addition to their heavy weights on their body, carry about 30 to 40 tons of bombs, and going over 3,000 miles and coming back after having unloaded their cargo. So there are advantages and disadvantages which your professors can explain and which I, as a layman, cannot

" We are bound to advance, and people say we have done so, but I honestly believe that the progress is negligible. We have talent, we have great talent, but it is not cared for either by Government or the community. The community has a greater duty to perform to find out such talent and to see that India progresses in industry which can give greater life and greater support to the younger men, and I am positive that students of such service will be always taken care of by the public.

" Gentlemen, you must study Russia's experience of only 15 years. During the Czarist period, the fate of Russia was perhaps far worse than that of India. But in the 25 years of Soviet Government after the last war, 10 years they wasted fighting amongst themselves. But for the last 15 years they have devoted themselves both scientifically and economically to improving the condition of the poor and in finding means for their comforts and needs of life. After having done that, they have got schools and colleges in every town where one unit can take care of 25 men or women or children, and at the same time can find help for every one in Russia. Primary education is absolutely free. Middle class education can be had at a very small expense, and for higher education they have facilities as also for research.

" When Russia was invaded by Germany, we have all seen that she fought with all that she had for the love of her country; otherwise she would not have fought against such highly mechanized German forces. They were devoid of means to stand against the great guns that Germany's science had produced. They did not sit quiet. They took the help of Britain and America, and at the same time put up huge factories in the Ural mountains to provide machines and guns of the same calibre and quality. They spent days and nights to procure materials and guns which can serve better than any produced by England or America or the Germans. Having done that, to-day you see the fruits of it. A nation which was very nearly crushed, for if Stalingrad had fallen Russia would have been wiped out, the Russians have turned the table within two years, and to-day they are such a mighty power that I am sure they will win the war within six months. If Russia can be like that within 15 years, why should not India ? "

Cotton Plant Puller Propaganda

By C. V. Sane (in *Indian Farming*)

Deputy Director of Agriculture, Southern Circle, Baroda

THE spotted bollworm of cotton is known to do very serious damage to the cotton crop in yield, colour and staple, particularly in Gujarat. The damage in any particular year depends upon the intensity of the attack. Study of the pest was taken up by the Indian Central Cotton Committee, and it was found that a thoroughly protected plant would yeild about 25 per cent. more cotton and be definitely earlier than when not so protected. This earliness was particularly valuable in years of frost. As a result of the research on the subject, it was found that the most practical way of ensuring this protection was by having a close season of at least eight weeks, during which the bollworm should find no place for shelter or food to carry on the brood between close of harvest and starting of another cotton crop.

Old Method and the New

The usual method of dealing with the old cotton stalks was to hack them with a spade which left all the underground root system intact and which in the soils of Gujarat soon produced secondary growth which was more than enough for giving the bollworm plenty of opportunity to continue the brood so as to be in readiness to attack the next crop of cotton.

The plant puller takes away the main root system along with the stalk, so that secondary shoots do not come up. If plant-pulling is effectively and generally done, the bollworm's supply of food and shelter is completely cut off. There is the possibility of alternative hosts, but the main danger is removed. In addition or even apart from this protection due to food scarcity produced thereby for the bollworm, the plant puller in actual use has been considered by all discerning farmers as an invaluable addition to their not very large armoury of implements. It has been observed without exception that the removal of the underground cotton stalk with the larger roots helps cultivation after rains so markedly, and thus saves the then precious time so unmistakably, that even for this facility alone, the plant puller was worth bringing into general use. The breaking of the harrow against a deeply set root stock, needing return to the village and the loss of time occasioned by having every now and then to stop to clear obstructing stem portions can only be appreciated by those who have had to put up with it. To these the introduction and use of the plant puller is a veritable treasure ensuring smooth cultivation without stoppages.

What Propaganda Can Do

However, having a finding in a research scheme is one thing and getting it to the ryot in a manner which will ensure general adoption is another. The mass of farmers is not easily convinced, and intensive propaganda and demonstration are necessary before even some footing is secured. This was carried on in the two districts of Navsari and Baroda of the Baroda State since August 1934 for four seasons with funds provided by the Indian Central Cotton Committee and for two seasons more as a joint scheme of the State: the Indian Central Cotton Committee's contribution was nearly Rs. 30,000 for the period.

Progress in the two districts has not been on the same level of intensity or response. In the Navsari District, in spite of its acknowledged usefulness, the plant puller did not catch on with the same ease or intensity as in the Baroda District. In the Baroda District, over 21,000 plant pullers were sold during this period for propaganda and demonstration as against 7,152 in the Navsari District.

The area under intensive attention in Baroda last year was over 1,40,000 acres and represented an intensity of 90 per cent. and above of plant-pulled cotton in certain areas.

This has been achieved by intensive propaganda in successive areas by means of magic-lantern lectures, distribution of leaflets in thousands and discussions and demonstrations by plant puller competitions and field tests.

The doubters and others who were critically conservative raised three points against the use of the plant puller: (*a*) loss of organic matter from roots removed, which otherwise remained in the soil; (*b*) bad physical condition of the soil consequent on root pulling, leading to a poor stand; (*c*) greater cost of plant pulling because it was considered that more labourers were required for plant pulling as compared with digging.

Objections Answered

These are clever destructive arguments. The first objection was easily answered when instances of holdings practising plant pulling for several years were known not to have suffered any reduction of yield of cotton or of fertility traceable to the supposed loss of organic matter. The second point of poor stand could not be disposed of straightaway. It had to be put to test for the satisfaction of those who were sincerely doubtful. Several tests both in Navsari and Baroda showed no difference in stand in the areas treated with the plant puller and adjoining areas cut with the *kodali*. In 1940-41, nine such tests in Dabhoi, Baroda, Padra and Waghodia talukas showed an average increase of 10 per cent. in yield on the plant-pulled portion as compared with the adjacent cut-over portion. The fear that the use of the plant puller may bring on a poor stand and so a reduced yield is not substantiated by any serious observation or tests, the areas treated with the plant puller actually showing higher yields. The third objection of increased labour cost has something in it, as a certain amount of experience is necessary in handling the plant puller, like any new device. Even so, it was amply demonstrated in the plant pulling competitions, of which we had more than 20 in the course of the propaganda in both the districts, that an acre a day per

(*Continued on page* 323)

The Indian Cotton Textile Industry (1880-1939)

By V. RAMAKRISHNA RAO, M.A., M.Litt. (Econ.)

(*Specially Contributed*)

THE Indian cotton textile industry is the biggest national enterprise which represents a total capital investment of well over 80 crores of rupees, which gives direct employment to no less than 450,000 workers and indirect employment to perhaps as many in the subsidiary industries and which is the largest consumer of Indian cotton—366,000 bales out of 5 to 6 million bales produced in the country. Its contribution to our national income, if the wages paid to the workers are included, is about 140 millions of rupees. It is not only the largest indigenous industry but it is also the largest exporting industry. The value of total cotton exports to overseas countries on private account alone, i.e., exclusive of those made on Government account, was 46 crores of rupees in 1942-43 or 25 per cent. of all the exports from India. Therefore, it is interesting to study the growth of this great national enterprise whose importance in our national economy cannot be exaggerated.

This great national industry dates as far back as 1818 when the first mill was started in Calcutta. The first mill in Bombay, which was destined to be the home of the cotton mill industry, was the result of Parsi enterprise and began working in 1854. Since then the industry has experienced great development in spite of the occasional setbacks due to famines, plague, foreign competition, fluctuations in exchange and in the prices of cotton and apathy and indifference of the Government.

The early concentration of the industry in the island of Bombay has been governed by factors other than natural and permanent, such as abundance of capital and credit facilities, the presence of cheap and speedy means of transport, and the temporary growth of demand for yarn from China, which Bombay was in an exceptionally favourable situation to meet. The year 1877 is notable in the history of the development of the industry from the point of view of its distribution. It saw the beginning of the rapid growth of mills in the up-country centres like Nagpur, Ahmedabad, Sholapur, etc. This later development was influenced to a great extent by natural factors such as the vicinity of sources of raw materials, plentiful supply of cheap labour and large markets. The wider distribution of the industry was also aided by the development of railways in India. Mention must also be made of the growth of the *swadeshi* movement from 1895 which in the absence of encouragement of the Government, tended to foster the rapid rise of the textile industry. The island of Bombay was losing ground, due mainly to the rapid decline of Chinese imports of Indian yarn and the very high labour and transport costs. Lately the factory legislation in British India created a tendency for the industry to migrate to the Indian States where factory legislation was not enforced strictly.

Though the industry dates as far back as 1818, complete statistics were not reported till the year 1879-80. The table below shows the growth of the industry from 1879-80 to 1913-14, i.e., upto the commencement of the last world war.

TABLE 1

Period	No. of mills	Persons employed (000)	Looms (000)	Spindles (000)
1879-80—1883-84 ..	63	51	14	1,610
1884-85—1888-89 ..	93	76	18	2,296
1889-90—1893-94 ..	127	116	25	3,263
1894-95—1898-99 ..	156	150	36	4,046
1899-1900—1903-04.	195	172	42	5,009
1904-05—1908-09 ..	218	216	60	5,549
1909-10—1913-14 ..	257	243	88	6,406

Taking the average for the period 1879-80 to 1883-84 as 100, we find that the number of mills increased by 308 per cent., number of persons employed by 374 per cent. and looms and spindles increased by 508 per cent. and 298 per cent.

In 1892-93 the Bombay Presidency possessed 74 per cent. of the mills, 83 per cent. of the looms and 75 per cent. of the spindles. This shows there was greater concentration of weaving industry in Bombay than spinning. By 1911-12 the share of Bombay fell to 68 per cent. of the mills, 77 per cent. of the looms and 70 per cent. of the spindles. This shows the process of wider distribution of the industry.

Another trend to be observed in the distribution of industry was the rising importance of Ahmedabad as a centre of the cotton textile industry. For example, in 1892-93, out of 88 mills located in the Bombay Presidency, 60 were located in Bombay Island, 21 in Ahmedabad and the rest in other centres of the presidency. In 1911-12, the position was that 85 mills were located in the island of Bombay, 59 in Ahmedabad and 20 elsewhere in the presidency.

The growth of the industry is also seen from the statistics of production of woven goods and yarn.

TABLE 2

(Million lbs.)

Average for	Yarn	Woven goods
1896-97 to 1900-01 ..	443.9	91.8
1906-07 to 1910-11 ..	636.8	194.1

In 1896-97 the percentage of indigenous production to the imports from abroad was 19.3 per cent. and in 1913-14 the same rose to 35 per cent.

This gradual and sustained development without State aid received considerable stimulus from the conditions created by the last war. The large patronage extended by the Government to the mills in respect of military requirements, together with the sharp decline in the imports from Lancashire as well as the steep rise in the prices of imported cloth, gave a fillip to the home industry, although the difficulty of importing machinery prevented as speedy a development as would otherwise have taken place. The progress of the industry during this period is shown by Table 3 below.

TABLE 3

Period	No. of mills	Persons employed (000)	Looms (000)	Spindles (000)
Average				
1909-10 to 1913-14 .	257	244	88	6,406
1914-15 to 1918-19 .	277	278	111	6,629

The production of the woven goods increased from 1,164 million yards in 1913-14 to 1,640 million yards at the end of the war. In terms of the import of foreign cloth, the production rose from 35 per cent. to 114.9 per cent. in 1918-19, that is to say, more than 50 per cent. of the home demand was met by the Indian mills.

The same period saw also the improvement in the quality of the goods produced. For example, in 1913-14 the percentage of yarn of counts 1 to 25 to the total production was 91 per cent. and the same dropped to 87 per cent. in 1918-19.

The wider diffusion of the industry continued during the war and in 1918-19, out of 258 mills at work, only 85 were located in Bombay Island, 61 in Ahmedabad and the rest elsewhere.

The prosperity enjoyed by the industry during the war is seen from the fact that in 1918-19, the dividend declared was as much as 40 per cent. in Bombay Island. This continued upto the year 1922.

From this year onwards, the industry entered on a period of ' atrophy ' caused by the post-war depression, keen foreign competition, labour troubles, over-capitalization, etc. These conditions are reflected in the amounts of dividend declared in 1925, which was as low as 2.2 per cent. The competition of Japan in the home market as well as in the Near East and African markets was severely felt. The severity of the Japanese competition is seen from the fact that the imports from that country were 108 million yds. in 1922-23 and in 1929-30 they rose to 562 millions yards. The depreciation of the yen and the reorganization of the Japanese industry by rationalization made the competition from that country still more keen. It virtually amounted to dumping of Japanese goods. Therefore, the industry made repeated representations to the Government for (1) repeal of the excise duty imposed on indigeneous production and (2) tariff protection against Japanese dumping.

After a good deal of representation in the country, the excise duty was abolished in August 1927. This is the beginning of State aid. But upto 1930, no protection to the industry was given by the Government. Therefore, it can be said upto this period, the industry developed from its inception as a result of the special advantages, (*a*) the fall in rupee exchange, 1873 to 1897, which gave protection to the extent of 25 per cent. to 100 per cent., (*b*) the *swadeshi* movement since 1895 and (*c*) the isolation of the Indian market during war.

From 1930, the growth of the industry was to a great extent due to tariff protection. As already mentioned, the Japanese dumping of cotton goods into India forced the Government to give protection to the industry. Further, the great economic depression, 1931-35, made it necessary to impose customs duties for revenue purposes. Thus the high revenue and protective duties helped the industry to make rapid strides. The progress of the industry under the shelter of tariff walls is seen from the tables given below:—

TABLE 4

	1932	1938	Percentages 1932	Percentages 1938
Bombay	81	69	23.9	18.2
Ahmedabad ..	78	78	23.0	20.5
Rest of India ..	180	230	53.1	61.3

The above table shows further deterioration in the position of Bombay Island. It is also seen that the growth of the industry during the period was entirely taking place outside Bombay Presidency.

The table underneath illustrates the phenomenal increase in home production.

TABLE 5

(Million of yards)
Production of piece-goods.

Year.	Quantity.
1922-23	1,725
1926-27	2,250
1929-30	2,419
1934-35	3,393
1938-39	4,269

During the period 1931-32 to 1938-39, Bombay's share in the total production fell from 39 per cent. to 32 per cent. while that of the rest of India increased from 38 per cent. to 46 per cent., the remaining being that of Ahmedabad.

With the growth of internal production the imports continued to shrink. There is no doubt that the civil disobedience movement of 1931-32 and boycott of British goods were two major factors responsible for the decline in foreign imports. In 1929-30, the total imports of foreign cloth was 1,882 million yards and the same declined to 647 million yards in 1938-39. The most remarkable thing to be noted in this period was the virtual loss of market for British cotton goods, the reduction being from 1,236 million yards to 205 million yards. This is so in spite of the preference shown to the British manufactures in the tariff duties. By 1938-39, the cotton industry was well established in the country with a virtual monopoly in the home market. This is an outstanding example of what can be achieved by protective tariffs.

Not only was there a large increase in the production of cotton tissues, there was also considerable improvement in the quality produced. The amount of yarn of counts 40 and above produced rose from 27.3 million lbs. in 1930-31 to 85.1 million lbs. in 1938-39, i.e., more than 300 per cent.

In regard to the size of the mill, there was not much improvement. This is explained by table 6.

TABLE 6

Average	1914	1931	1938
Spindles per mill ..	25,014	26,360	26,368
Do. looms..	383	532	527
Average spindles per loom	65	54	50

The present war affords another opportunity for the industry to set its house in order and to capture the entire Indian market and to face competition on equal terms in Eastern countries of Asia and Africa. It is gratifying to note that the Government control exports so that the quality of goods sent abroad is maintained and that they intend to build up a research fund out of the export cess.

Distribution of Industrial Activity in India

State in Relation to Industrial Location

"THE problem of industrial location has to be viewed from several angles. From the limited standpoint of each industry the dominant consideration must always be to secure the maximum efficiency of production and distribution. Indeed, no industry can prosper unless it is located at a place chosen from this point of view. Experience shows, however, that if industrial location is governed by this consideration alone, it may easily give rise to a variety of social and economic evils, such as excessive congestion in particular localities, concentration in vulnerable areas and wide disparities in the living standards of different sections of the population. Modern industrial communities which have suffered from these evils have begun to feel the need for some kind of regional planning of industry, which would aim not merely at maximum efficiency of production and distribution but also at an optimum distribution of industrial activity based on broader economic, social and strategical considerations."

Thus observes a memorandum of the office of the Economic Adviser to the Government of India on "The Location of Industry in India." This memorandum is intended to serve as a basis of discussion by the Policy Committees on Postwar Planning.

Distribution of Industrial Activity

On the whole, the memorandum observes, the distribution of industrial activity in India is extremely uneven. In 1939, as much as 52 per cent. of the total number of factory workers in India were found in only two provinces, namely, Bengal and Bombay. The economy of this country, it says, "is already heavily unbalanced as a result of its excessive dependence on agriculture and the disadvantages arising from this fact are further aggravated by this uneven distribution of industry. If India were highly industrialized, this excessive concentration of industry would not have perhaps been such a serious matter, but when the total number of factory workers is less than 1 per cent. of the total population, the concentration of 52 per cent. of this small number in two provinces reduces the share of other provinces to an even more insignificant figure as compared with their population. The wide disparities in the standards of living in different parts of India are at least partly due to the differences in the degree of industrial development." In recent years, however, the memorandum states, as a result of various factors there has been a gradual dispersal of industries to new centres. The tendency towards dispersal is most marked in the case of the cotton textile mill industry.

More Industrial Expansion in Indian States

According to the memorandum, there has been a pronounced tendency for new enterprises to be attracted to Indian States owing partly to various inducements offered by the States' Governments and partly to the relatively low level of rents and wages there. The possibility of escaping the incidence of high taxation in British India is an additional inducement. If the increase in factory employment can be taken as an index of industrial expansion, nearly 33 per cent. of the total expansion between 1921 and 1939 took place in the States, particularly Hyderabad, Mysore, Baroda, Kashmir and Central India States. The rate of expansion in the States was also higher than in British India.

Uneven Distribution of Industrial Workers

In 1921 as well as in 1939, observes the memorandum, not only was industry unevenly distributed absolutely but also in relation to the distribution of population. The most conspicuous examples were Bengal and Bombay which, with 15 and 5 per cent. of the population respectively contained 29 and 23 per cent. of the total number of industrial workers in the latter year. All other provinces except the smaller areas of Baluchistan, Ajmer-Merwara, Delhi and Coorg possessed smaller shares of the industrial population than would be justified on the basis of their shares in the total population. But the dispersal trend already referred to, the memorandum explains, was in operation in Bengal and Bombay during the years herein mentioned. During these years, while the share of Bengal in the total number of industrial workers declined from 35 to 29 per cent. and that of Bombay (including Sind) from 25 to 24 per cent., Madras increased its share from 8 to 10 per cent., U.P. from 6 to 8 per cent. and Punjab from 3 to 4 per cent.

State and Industrial Location

What should be the policy of the State in regard to industrial location?

The memorandum enunciates a twofold objective of national policy; a planned development of industrial towns and a more even distribution of industry as between regions in order to secure a balanced development of the country as a whole. During the last two decades, the population of most of the industrial towns in India has increased by leaps and bounds and the memorandum states that if India's industrialization is to be accompanied by a further concentration in such towns, the benefits resulting from industrialization will be largely nullified by the tremendous social cost which the nation will incur in the form of slums, disease, congestion, accidents and a general deterioration of mental and physical health. Direct State control may also be necessary to prevent an excessive concentration of industry and population in vulnerable areas.

With regard to the second objective, the memorandum makes it clear that in a country like India it will be extremely dangerous for the State to arrogate to itself the right to determine the location of individual undertakings. The successful conduct of industry from the business point of view is of primary importance if India is to achieve the desired industrial progress. At the same time, considerable stress has been laid on the need for taking direct measures for encouraging the industrial progress of backward areas, e.g., the development of internal communications and power resources, the creation of suitable financial institutions for mobilizing the capital resources in such areas and special assistance to the particular industries suited to such areas. The memorandum gives a detailed account of the work done by the Special Areas Commissioners in Great Britain and advocates similar measures for encouraging the dispersal of industry into the countryside.

The memorandum pleads for a proper co-ordination between house-building and road-building on the one hand and industrial development on the other. " In the absence of proper planning in this respect," it states, " we may discover when it is too late (as other countries, e.g., Great Britain have done) that a large part of our investments in housing and roads could have been turned to a much better account if it had been duly co-ordinated with our programme of industrial development." While it deprecates the further growth of some of the existing towns, it makes out a plea for increased urbanisation of the population through a planned dispersal of industrial activity, on the ground that it will be impracticable to provide many of the modern services and amenities on an efficient scale except in towns of an optimum size. " As an instrument of urbanisation, therefore, dispersal of industry can be the starting point of a great deal of social and material improvement in the country."

◆

Hours of Work and Output*

Enquiry by the Industrial Health Research Board

A REPORT entitled " A Study of Variations in Output " has recently been published by the Industrial Health Research Board of the Medical Research Council in United Kingdom.

In a previous inquiry by the Board it was revealed that except as a temporary emergency measure, working hours in manual operations involving a fair amount of physical effort should not exceed 60-65 per week for men and 55-60 for women; longer hours will in time result in reduction of output and increase of lost time and of spoiled work. In the latter part of 1942 the weekly hours of work were reduced in several factories engaged in war production; it was thought that the change, though in some cases very small, might have a measurable effect on output, and the present investigation was designed to ascertain whether, and to what extent, such an effect occurred.

The investigation, which was carried out in seven factories, was chiefly concerned with women workers. The extent of the reduction in hours varied widely at the factories concerned, but in most cases it was between 3 and 8 per cent. Twenty-one groups of workers, covering nearly 4,000 individuals, were studied, and the investigation showed that on an average hourly output was 4.1 per cent. higher, in the twelve weeks following the reduction in hours of work, than it was before the change. In the case of five groups the increase in the hourly rate of output after the change ranged from about 11 to 21 per cent., and only in six out of the twenty-one groups was there a decrease in the rate of output following the reduction in hours.

It was found, however, that although the factories to be studied and the operations to be measured were selected most carefully in order to avoid as far as possible external influences, many other factors, operating simultaneously with the reduction in hours, tended to obscure the effects of the latter on output. The most important of these factors were changes in the type or design of the product; mechanical breakdowns and variability in the material which had to be worked; flow of working material; technical improvements in the design of the machines used; changes in the general lay-out of the work; and personal factors, such as dissatisfaction with the method or rate of payment and occasional friction between the management and the workers. In only three of the groups studied was it possible to infer with some degree of certainty that the hourly output increased as the result of the shorter hours of work; even then the position was complicated in two cases by the incidence of the annual holiday.

Despite the difficulties encountered, the Report suggests that shortening of a working week may directly result in increased output, but adds that this effect may be relatively small. There is, moreover, some indication that shorter working hours lead to a decrease in absence from work.

Some information was also obtained as to output and absence on different shifts. On the two-shifts system there was practically no difference in output between night and day work. On the three-shift system there were indications that output was likely to be highest on the afternoon shift and lowest on the morning shift ; the differences, however, were not large. Absence was found, on the average, to be appreciably higher among two groups of women employed on the three-shift system than among five groups of women on the two-shift system.

The results obtained in this and the previous investigation suggest that, of all the factors studied, technical improvements and reorganization are the most likely to lead to an increasingly high and steady level of efficiency. In conclusion, the Report emphasizes the importance of relating the design and operation of machines to human capacities, if the greatest efficiency is to be attained ; in other words machines should be made for men, not men forcibly adapted to machines.—*Indian Labour Gazette.*

Post-war Industrial Development

Future of India's Trade and Commerce

Government of India's Plans

THE following extracts from the Second Report of the Reconstruction Committee of the Viceroy's Executive Council, released last month, will be read with interest:—

If industrialization is to be one of the major aims of economic policy, a steep and even spectacular increase in India's import trade would be inevitable in the post-war era. Although India's capacity to pay for the imports has been greatly strengthened by the growing accumulation of sterling balances and by the reduction of the external debt, the financing of foreign purchases will still entail the maintenance of the export trade at the highest possible level. Moreover, a higher level of trade and commerce would help to increase the wealth and purchasing power and to reduce the incidence of unemployment. But international trade is not unilateral, and no country can lay down a commercial policy for itself in isolation from others. Although it would not be possible to bring the determination of a post-war trade and commercial policy for India to the stage of finality before the framework of the new order contemplated by the United Nations has been fashioned, an endeavour should be made to determine provisionally what policy is best suited to Indian conditions and interests.

Export Policy

As far as possible, export of raw materials should be replaced by export of semi or fully-manufactured goods. Undue dependence on a particular market for the disposal of a particular class or classes of goods, should be avoided, but increased attention should be paid to the development of Eastern markets. Standards of quality for export goods should be laid down and rigorously enforced and encouragement should be given to the formation of larger export units and to action directed towards an improvement in existing trade methods. State-owned organizations should be set up at the appropriate time for the purpose of trading with State-trading countries or in commodities produced or manufactured by State-owned enterprises.

Import Policy

Subject to what is stated in the succeeding paragraphs, it would be of considerable importance to avoid undue dependence on particular import markets and to consider whether action should not be taken to check the growing tendency for companies domiciled abroad to establish branches or subsidiaries in India for purposes of both import and internal distribution in preference to employing Indian or other established agency houses.

Future of Trade Controls

Export and import controls owe their origin to war-time conditions which include economic warfare, supply and availability considerations, difficult currency and shipping. These conditions, or secondary manifestations of them, are bound to persist for some period after the war which may be estimated at about three years. During this period, the present controls should be maintained with greater or lesser severity. But, it is clear that the general trend of international opinion is towards the complete abolition of these controls in all countries at the end of this period. To continue the controls when the present abnormal conditions have disappeared would not be easy and might invite reprisals from other countries; but that should not blind us to the fact that if any comprehensive scheme of industrial development is undertaken in the post-war period, some form of trade control, particularly on imports, will be found inevitable.

It would be necessary to adjust war-time controls in sufficient time to ensure that—(*a*) orders could be placed for the import of capital and consumer goods from overseas and that the necessary priority of shipping could be obtained for the goods urgently required; (*b*) contacts, and possibly contracts, are made with possible purchasers overseas to ensure the retention of pre-war markets and the creation of new ones; (*c*) the necessary foreign exchange is made available to finance imports.

Tariff Policy—Export Duties

India's policy in regard to the imposition of export duties should continue to be guided by the following recommendations:—

(*a*) Export duties should not be imposed for the purpose of protecting industries.

(*b*) Export duties for revenue purposes should be employed sparingly and with great caution; they should be imposed only on articles in which India has a monopoly or a semi-monopoly; and in every case the duties should be moderate.

(*c*) There is no objection to the imposition of small export cesses, the proceeds of which do not go into general revenues but are devoted solely to the improvement of industries including agriculture on which they are based.

Tariff Policy—Import Duties

The revenue tariff imposes a relatively moderate uniform rate of duties on all commodities subject to the levy of a much higher duty on particular articles, mainly of the luxury type, and to exemption from duty or admission at low rates of other articles where the national interests require such concessions. This is a policy which has stood the test of time and might well be followed in the post-war period, though the actual content of the tariff schedules should be subject to review from time to time. One of the weaknesses of the fiscal system has been the extent to which Central revenues had been dependent on customs duties. The present trend towards the enlargement of the scope of direct taxation and excise duties is a wholesome development which should be further encouraged in the post-war period.

Protective duties are imposed in pursuance of the accepted policy of protection. The principles and working of this policy must form the subject of a detailed investigation. Meanwhile, the provisional view is that the economic interests of the country would be best served by the continuance of a policy of protection subject, however, to a liberalization of the principles governing the selection of industries and of the procedure for the initiation and conduct of investigations into claims to protection. The grant of protection would not be confined to existing industries and investigations about the necessity for granting protection to industries yet to be established would be made.

While subsidies and bounties would be unsuitable for countries like India with limited revenue resources and might involve regressive taxation, they may have to be granted as a special measure in some cases.

The resuscitation of the Tariff Board should have first claim on the attention of Government as soon as normal competitive conditions are beginning to be restored, but before that stage is reached provisional decisions should be made as to the status, functions and the period of appointment of the future Board.

Treaty Policy

The ultra-cautious and conservative policy of "do not enter into a trade agreement unless you *must*" should give place to a progressive policy actuated by an anxiety to enter into trade agreements whenever there appears a prospect of a commercial advantage being gained for India. In particular, if the proposals sponsored by the leading members of the United Nations for a multilateral convention covering the principal aspects of commercial policy materialize, we may adhere to such a convention, provided our vital interests are safeguarded. If no such convention is accepted internationally, or, if accepted, to the extent permitted by it, we should endeavour to conclude commercial treaties or bilateral trade agreements on a most favoured nation or other suitable basis with our principal foreign customers or suppliers. At the same time, consideration should be given to the difficulties which have militated against India's adhesion to certain international conventions without awkward reservations, such as the position of Indian States and the treatment of claims to national, or most-favoured-nation, treatment with respect to internal duties levied for the benefit of local authorities.

Industrial Development

The following paragraphs deal with the methods by which it is proposed to foster planned industrial development in India.

For the direction of planning an Industrial Adviser to the Government of India has been appointed. He will be assisted by a number of Deputy or Assistant Industrial Advisers. It is intended to set up a representative Industries Committee from among the foremost industrialists in India, together with representatives of Provinces and States. This Committee will be consulted from time to time on questions of policy pertaining to industrial development. For the actual development work, panels consisting of one or two industrialists concerned with the particular industry, or group of industries, and assisted by experts and an officer from the Planning and Development Department, will be formed. Side by side with this, the Provinces and States are also being advised to set up industries committees of their own so as to see that their own special needs are not lost sight of. The recommendations of the industrial panels would be co-ordinated with those of the Provincial and States Committees before they are considered by the Government of India. This should not prevent the Provinces from going ahead with such schemes of industrial development as may be ready. Such proposals will be examined by the Government of India on their merits from the point of view of any controls that may be required and any assistance that may be desired.

In order to promote Indian industrial development and also to provide first-hand up-to-date information of what is happening in other countries it is proposed to arrange visits by leading Indian industrialists to Great Britain and if possible to U.S.A., and to give them all facilities possible under present circumstances to make contacts, exchange ideas and discuss mutual arrangements for implementing post-war plans. Arrangements are under way for the first group of certain well-known industrialists to leave as soon as they are ready.

Besides organized industry contemplated above the development of small-scale manufacturers and of cottage and bazaar industries will also be taken up. Panels for the development of small-scale industries, particularly those which have grown up during the war, are also being formed in the Supply Department. The question of marrying cottage production with organized industry, as has been successfully done in Japan, is a possibility, but without the horrors of exploitation that the ruthless capitalist and military creed of that country brought into being. This work is especially the field of Provincial and State Governments and efforts will be made to give them every assistance and to work in the closest co-operation with them.

Another form of industry that requires planning is that connected with the processing of natural products and minerals. These may involve only the preliminary processes or be developed so as to carry right through to the finished product. The Agricultural, Forestry and Fisheries Departments, and the Geological Survey, combined with the Board of Scientific and Industrial Research, will be able to render great assistance in promoting development in this direction.

As far as it can be seen at present planning for post-war development falls chronologically into two different phases: (i) planning for the conversion from war to peace production and for ensuring the continued operation on peace-time work of plants installed for munitions production, and (ii) long-term planning for the industrial development of India.

Regarding the first, it is very essential that plans be prepared immediately to turn over from war to peace; otherwise widespread unemployment and unrest will result as well as an unpardonable wastage of industrial potential. With this problem is also involved the question of rehabilitation of industry and the making good of war arrears in plant repairs and replacements. In order to prepare the ground for this work it is necessary to have as complete a picture as possible of Indian industries as they are to-day and of the position in which they are likely to find themselves at the end of the war. For this purpose a questionnaire was issued to the industry as far back as November last. The response so far has been poor ; attempts are, however, being made to expedite the replies to this questionnaire as well as to collect this information by other means.

In the same connection, i.e., rehabilitation, should be considered the question of any expansion that existing factories may be contemplating immediately on the cessation of hostilities. Some part of such expansion may fall under the purview of the long-term plan but most of it will be the legitimate extension which would have proceeded normally but for the war. There is bound to be competition for such extensions as soon as hostilities cease and it is necessary to plan with this contingency in view. To this end a questionnaire was issued last October asking Industry to report its capital goods (machinery) requirements. Response here too has been poor.

A special problem arises in connection with the Government-owned munition, food, clothing and other factories. One alternative would be to hand them over to private industrialists on suitable terms reserving only such as are required for the production of lethal weapons and special equipment. This might involve agreement to the maintenance of certain special machinery that might be required for war production.

Another method would be for Government to convert these factories to civil production under Government management, e.g., for machine tools, radio sets, scientific instruments, aircraft parts and maintenance, etc., whilst retaining their war potential. There is much to be said for this method provided the factories are managed on commercial lines. They might become valuable training grounds for highly skilled technicians and also produce goods which at this stage could hardly be profitably produced by private firms. They might also undertake the production of the more specialized equipment required by the Railways and P. and T. Department.

It may be noted that after the last war Australia procured valuable equipment at a low price from surplus munition factories in the U.K. and thus laid the foundations of her present munitions industry. It is possible that India might do the same especially as it is believed there is likely to be a surplus of machine tools in the U.K. as well as of specialized equipment for making munitions.

As regards the second phase, namely, long-term planning, we have the All-India and Provincial Industrial Committees and the Industrial Panels through whom the Plan will be prepared.

The imposition of controls will require legislation with special reference to the licensing of industries, control of imports of capital goods and a control of capital issues. The question whether agreement can be reached with States as to the application of any of these controls will also have to be reviewed. These measures will have to be considered in conjunction with the Governments of Great Britain and the U.S.A. and it is to be anticipated that if they maintain any control over the manufacture and exports of capital goods, they will be ready to accept the recommendations of the Government of India in respect of priorities. It will also be necessary to take steps to ensure the grading and guarantee of the quality of Indian products. The building up of India as a great industrial country may be seriously jeopardized by questionable methods, unreliable samples or inferior workmanship on the part of a few manufacturers and it may be necessary to devise machinery to guard against this and to ensure standardization of grades and uniformity of samples and manufactures.

The examination and review of industrial development will have to decide the following questions of policy:—

(*a*) Whether the development is desirable and in what location.

(*b*) What assistance, if any, is required from Government in the form of tariffs, finance, etc.

(*c*) What agency should undertake it.

(*d*) What priority should be given to the import of the capital goods required.

(*e*) Whether suitable labour is available and whether suitable arrangements have been made for housing.

(*f*) Whether adequate technical staff is available or can be obtained.

(*g*) Whether coal and/or electric power are easily available.

(*h*) Whether adequate transportation facilities can be provided.

(*i*) Proximity to markets or to ports for export.

Industrial development cannot proceed according to artificial governmental boundaries; it must depend upon the geography or raw materials, power and markets. Planning will, therefore, have to be regional to a certain extent and the recommendations of Provincial and State authorities will have to be co-ordinated with the practical advice of industry. Development will, therefore, not only be a question of assistance by Government but also of direction, co-ordination and control.

The pace of development is likely to be governed more by the availability of imported machinery and technical staff than by considerations of finance. These are both matters in which Government assistance may be necessary.

The most serious difficulty facing the expansion of industry will be the dearth of technical staff, especially for the higher technical and managerial posts. Efforts are being made to arrange for the despatch of promising young men to the U.K. for this type of training. It may be necessary to obtain a quota for Indian students at the Universities and technical colleges in the U.K. in view of the very large influx of British students expected at the end of the war.

The major industries will require examination in detail under the following heads:

(*a*) Technical—to determine if the industry can be efficiently established in India in the proposed location, or where it should be located.

(*b*) Scope—to decide on the range and variety of articles to be produced.

(*c*) Commercial—to decide if markets are available in India or overseas and what competition is to be anticipated.

(*d*) Strategic—to settle whether the industry is necessary on Defence grounds or is essential to economic development.

Advantages of Larger Package and Bigger Ring Diameter

Suggestions for Post-war Development

BY TRILOKI NATH SHARMA

(*Specially Contributed*)

MOST of the textile mills in this country have got at present ring frames of 5″ lift and 1⅝″ ring diameter for spinning coarse, medium and fine counts.

Since the length of coarser yarn on 5″ lift and 1⅝″ ring diameter bobbin is comparatively less, it is neither economical nor convenient to employ ring frames with smaller lift and smaller ring diameter for the spinning of coarser yarn.

The following table shows approximately the length of yarn of different counts on various lifts and ring diameter bobbin.

Lift	Ring dia.	Length of yarn in yards							
		10s	12s	14s	16s	18s	20s	22s	24s
5″ ..	1⅝″	525	630	735	840	945	1,050	1,155	1,260
5″ ..	1¾″	575	690	805	920	1,035	1,150	1,265	1,380
5″ ..	2″	646	775	904	1,034	1,163	1,292	1,421	1,550
6″ ..	1⅝″	630	756	882	1,008	1,134	1,260	1,386	1,512
6″ ..	1¾″	690	828	966	1,104	1,242	1,380	1,518	1,656
6″ ..	2″	775	930	1,085	1,240	1,395	1,550	1,705	1,860
7″ ..	1⅝″	735	882	1,029	1,176	1,323	1,470	1,617	1,769
7″ ..	1¾″	805	966	1,127	1,288	1,449	1,610	1,771	1,932
7″ ..	2″	904	1,085	1,266	1,446	1,627	1,808	1,989	2,170
8″ ..	1⅝″	840	1,008	1,176	1,344	1,512	1,680	1,848	2,016
8″ ..	1¾″	920	1,104	1,288	1,472	1,656	1,840	2,024	2,208
8″ ..	2″	1,033	1,240	1,446	1,653	1.859	2,056	2,273	2,480
9″ ..	1⅝″	945	1,134	1,323	1,512	1,701	1,890	2,079	2,268
9″ ..	1¾″	1,035	1,242	1,449	1,656	1,863	2,070	2,277	2,484
9″ ..	2″	1,163	1,396	1,628	1,861	2,093	2,326	2.559	2,792

Let us examine the advantages and disadvantages in two similar mills, one equipped with ring frames with 5″ lift, and 1⅝″ ring diameter and the other having spinning frames of 7″ lift, 2″ ring diameter, all other details remaining entirely identical in the two mills.

Particulars	Mill No. 1.	Mill No. 2.
No. of ring frames	40	40
No. of spindles per frame	352	352
Lift	5″	7″
Diameter of ring	1⅝″	2″
Revolution per minute of front roller	182	182
Diameter of front roller	⅞″	⅞″
Spindle speed	7,500	7,500
Counts spun	10s	10s
Working hours	9	9
Time taken to complete one set	38 mts.	65 mts.
Number of doffs in 9 hours per frame	14.6	8.4
Number of doffs in 9 hours in 40 frames	584	336
Weight of yarn in one set in lbs.	22	38
Time taken to restart the frame after doffing	2 mts.	2 mts.
Actual doffs in 9 hours per frame	14.0	8.0
Number of doffs in 40 frames (actual)	547	325
Production in 9 hours per frame	301 lbs.	309 lbs.
Production of 40 frames in 9 hours	12,040 lbs.	12,350 lbs.
Work done by a doffer in 9 hours	12 doffs.	12 doffs.
Doffers required in 9 hours	46	27
Number of empty pirns required in 9 hours	1,92,544	1,14,400

From the above data it is clear that:—

1. No. 2 Mill will get about 300 lbs. extra production in 9 hours.

2. No. 2 Mill will require 27 doffers as against 46 required in No. 1 Mill.

3. No. 2 Mill will require 1,14,400 ring bobbins to work 40 ring frames, as against 1,92,544 required to work the same number of rings in Mill No. 1.

4. Since the number of doffs is less in Mill No. 2, the breakage will be about 22 per cent. less, as most of the breakages of ends occurs when the machine is restarted after doffing.

5. The tenter in Mill No. 2 will have less work and during the time thus saved, he can look after more spindles.

So far we have discussed the advantages anticipated in spinning in a mill where the ring frames are installed with longer lift and bigger ring diameter. Now let us see how it affects the subsequent process, such as winding, warping, sizing and weaving.

Most of the work of a winder is to replace ring bobbins, from which the yarn has either run out or is broken in the process of transferring the yarn to the warper bobbins, apart from taking out the slubs, snarls, kinks and weak places. The operator makes suitable knots as and when required. While by improving the quality of the yarn we can minimize the yarn breakages, we cannot decrease the changing of bobbins when run out.

Let us see how the longer lift and bigger ring diameter influence the working of the winding department. The following table shows a comparison of longer lift and bigger diameter and small lift and small diameter performances.

Particulars	Mill 1	Mill 2
	5″ lift, 1⅝″ ring dia.	7″ lift, 2″ ring dia.
Number of spindles a winder can manage	15	24
Number of ring bobbins required to fill one warper bobbin.	18	11
Number of knots in one warper bobbin	17	10
Number of winders required to work one winding frame of 300 spindles	20	13
Count of yarn worked ..	10s	10s

From the above table we find that it will be economical and convenient to have ring bobbins of longer lift and bigger diameter. The cost of production will be low, apart from the ease in operation which the winding department will have.

Although there seems to be no direct relation between warping and ring bobbins, and although the change in any shape or form in the size of bobbin should not have any effect on this department, we should examine if there is any influence, good or evil, with warper beam prepared from bigger ring bobbin.

Particulars	Mill 1	Mill 2
	Lift 5″, Ring dia. 1⅝″	Lift 7″, Ring dia. 2″
Counts of yarn	10s	10s
Number of ends	450	450
Length of yarn on warper beams in yards	6,000	6,000
Number of knots in the beam.	5,143	2,983

It is seen from above table that the beams prepared in No. 2 Mill will have very few knots as compared with the beams prepared in No. 1 Mill.

These knots, especially in coarser counts, give trouble in the weaving shed, keep down efficiency and increase the damage percentage. The cloth with fewer knots is better in every respect.

So far, we have shown the advantages of the longer lift and bigger size of rings. Now let us see its disadvantages, if any, and whether ways and means can be adopted to overcome the difficulties.

Difficulty is encountered on the spinning frame, due to the limitation of the ring traveller speed, as, for example, the surface speed of the traveller, when the spindles having a ring of 1⅝″ in diameter revolve at 12,000 r.p.m., is 1,702 yards per minute. When the diameter is changed to 2″ the spindles are worked at a lower speed of 9,775 r.p.m. While the surface speed of the traveller in both the cases remains the same, the spindle speed in the latter case is reduced considerably. The reduction in spindle speed means decrease in production.

If the spindle speed is increased, the travellers will begin to burn and fly off. It will not be possible for a minder to look after his spindles. 9,750 r.p.m. is the limit of spindle speed, which it is not possible to exceed when the diameter of ring is 2″.

We have taken 12,000 r.p.m. spindle speed, which is rather on the higher side. Generally it is rarely kept, although efforts are being made by machine manufacturers to make the ring spindle work at higher speeds.

There are many coarse counts, such as 10s to 16s, where the spindle speed is kept from 7,500 to 9,500 r.p.m. irrespective of the ring diameter. Therefore, 2″ ring diameter will work on the above counts without any difficulty.

Finer counts, where the spindle speed is higher, will not work with 2″ ring diameter. It is necessary, therefore, to change this. On longer lift frames, the tension on the yarn is increased and causes increased breakages. There are many ways which help to reduce the tension and remove other defects such as ballooning, especially when the machine is started with a fresh set. Machine manufacturers are supplying special types of separators, rising and falling lappets, etc., to keep down the number of breakages.

All these small changes may not be required, if the rings have got variable speed motors or arrangements to start the ring frames at slow speed when the frame is started. The speed can, however, increase automatically, as soon as the bottom is formed.

A reputed firm have so designed their ring frames that the spindle rail moves up and down in the place of ring rail. With this arrangement, it will be possible to employ ring frames of higher lifts in conjunction with variable speed drive.

It will be possible to spin medium counts without any difficulty.

Indian Trade Commissioners Abroad

Important Role in Post-war Period

DURING the present war emergency, Indian Trade Commissioners are performing certain functions outside their normal duties in the territories under their jurisdiction where there is no other suitable officer to represent the Government of India. For example their services have been utilized in arranging for the supply of raw materials required for Defence Services and for recruitment of specialists for military services and nurses for the Indian Nursing Services (Temporary).

The first Indian Trade Commissioner was appointed in the U.K. in 1917 ; but it was not until 1930 that definite steps were taken to set up Trade Commissioners' posts in countries in which the fostering of India's trade was a matter of some importance. At the outbreak of the war, there were Trade Commissioners in London, New York, Alexandria, Mombasa, Hamburg, Milan and Osaka ; but the last three offices had to be closed down on the outbreak of hostilities. New posts of Trade Commissioners have since been created at Sydney, Toronto, Buenos Aires and Persia.

Indian Trade Commissioners will be called upon to play an important part in fostering and developing India's trade in the post-war period. During normal times, their principal duties are to answer trade inquiries which are directed to the development of markets for Indian goods, to furnish commercial information directed to the development of Indian export trade required by Government Departments, to report local developments likely to affect Indian trade, to organize exhibits of Indian goods at local exhibitions and fairs, to represent the possibilities of Indian trade by means of lectures, display of films and other suitable methods and to take such other steps as will promote the development of India's foreign trade.

These functions could not be performed during the war period, for obvious reasons, principally due to war-time restrictions on imports and exports. But with the end of the war these and other duties of the Trade Commissioners will assume their usual peace-time importance, which will be far greater than in the pre-war years. As there will be a variety of new and intricate problems to be tackled regarding India's foreign trade in the coming years, the Trade Commissioners may be expected to render in the post-war period a very useful service in fostering and developing India's export trade in a manner which will be conducive to the general economic and industrial development of the country.

Cottage Industries in the Bombay Province

Their Place in the Rural Uplift Plan

(*Contributed*)

COUNTRIES depending for their subsistence mainly on agriculture are proverbially poor, and India being what she is, is no exception. The pressure of population on soil and the consequent low standard of income is the root of all evils associated with village life, such as illiteracy, ill-health, improper nourishment, high death-rate, enforced idleness for the greater part of the year, want of minimum comforts by way of housing and clothing. Any plan intended to remedy these evils must particularly concentrate on improving the *per capita* income, which alone can ensure to every man, woman and child two meals, shelter, clothing and such other amenities as are necessary for a just and reasonable existence.

Agriculture is the primary occupation of the people. Therefore, the success of any rural uplift plan must depend upon:—

(i) Improving agriculture and making it a paying proposition.

(ii) Gainful occupation of a subsidiary nature to agriculture for the under-employed (in most cases agriculture is only seasonal,

(iii) Whole-time small-scale industries to give steady employment to surplus labour.

Agriculture alone cannot hope to give full employment to our teeming millions. Thus the value of subsidiary cottage occupation and small-scale industries in the rural economy towards improving work, wage and wealth cannot be denied. Cottage industries flourished in India not long ago and gave employment to a large percentage of its population. Its products not only met the demands of home markets, but were exported to foreign countries where they were greatly appreciated. But the dumping of cheap imported goods, competition from machine-made products of organized industries and lack of assistance from Government and the general public ruined these industries, with the result that the healthy balance between agriculture and industry was disturbed to the detriment of the villager.

Large-scale industries of the following type are essential, however:—Mining and metallurgy, chemical industries such as fertilizers, heavy chemicals, dyestuff, rayon, fine chemicals and drugs, etc.

Apart from the virtue of the direct employment which these industries provide, they render possible and greatly facilitate the development of all kinds of small-scale and cottage industries, the finished product from the former class functioning as raw material of the latter or *vice versa.* In this connection, mention may be made of Japan and Germany, where a considerable proportion of the industrial production comes from factories employing a very small number of operatives.

Cause of Decline of Cottage Industries

It is a curious fact that in spite of numerous handicaps and practically no organized help from any quarter, some of the cottage industries have continued to linger. A living example is the handloom weaving industry which in spite of its languid condition, gives the largest employment, next only to agriculture. The important handicaps adversely affecting cottage industries in general are:—

(i) Difficulty of obtaining raw materials in sufficient quantities regularly and at a fair price. (It must be observed that organized large-scale industries purchase their entire requirements of raw materials for the year during the season.)

(ii) Lack of facilities for improvement of manufacturing technique, so that quality, design and standard could be improved to suit the changing tastes and fashions.

(iii) Lack of capital (exploitation by money-lenders).

(iv) Absence of facilities for publicity and marketing (exploitation by middlemen).

(v) Taxation.

(vi) Conservatism, lack of initiative, etc.

But the cessation of imports and huge demands to meet civil and military requirements during 1940, however, offered them opportunity to prosper. The Government had to look to these industries for the supply of blankets, *kumblies*, tentage, camouflage nets, hats, leather and rubber goods, etc. The Provincial Governments were directed to give all possible assistance, such as supply of raw material, financial help and technical guidance. But the Government of India may not show the same concern for these industries after the war. With the return of competition in the post-war period the future of cottage industries can be anything but bright. Their resuscitation and progress demand a thorough survey, planning and organization. The Bombay Government appear to have given little attention to cottage industries in " Planning for the Future of Bombay's Countryside."

Cottage Industries

In considering the question of new occupations or giving encouragement to existing ones, the aim should be to select industries (i) for which raw materials exist or can be had at sufficiently low rates, and (ii) occupations for the practice of which certain areas are most suitable from the viewpoint of meeting the peculiar needs of the local market, availability of power, suitable labour and facility for quick and cheap transport.

The raw materials in Bombay Province fall under five heads:—Power resources; agricultural products; animal products; forest products; and marine products.

To review the position under some of these five heads.

Power Resources

We have no coal in our province. But fortunately, we have huge resources for hydro-electric power which are more than a substitute for coal as motive power. Except for the hydro-electric power generated in the vicinity of Bombay, these resources have remained untapped. We have observed how as a result of supply of cheap electric power in Mysore, Madras and Travancore cottage industries have sprung up, tapping the local known and as yet unknown resources. It is a matter for gratification that the Bombay Government has been making the necessary survey and effort to put up a grid system which will facilitate the supply of power to rural areas.

Agricultural Products

The important food crops are *jowar*, *bajra*, wheat, rice, sugarcane. Some of the industries connected with these are fairly developed, such as rice milling, paddy boiling; grinding of cereals; manufacture of jaggery, etc.

Tapioca.—In the Konkan strip where the rainfall is fairly abundant, tapioca can be grown on uplands (lands not suitable for paddy). A visitor to Malabar can realise how this root has saved millions from starvation. If not required as foodstuff the Travancore villagers convert it into starch—a valuable product for textile sizing and finishing. It was the Travancore tapioca starch which sustained the textile industry in the years 1940, 1941 and 1942. But an embargo was later imposed as the rice scarcity had become acute. Tapioca is a hardy plant, resistant to draught, pests and parasites and requires little attention in cultivating it. The Agriculture Department must take the lead in introducing this valuable dual-purpose crop in this province.

Cotton.—Carding, hand spinning and handloom weaving. The A.I.S.A. has been doing good work in the promotion of cottage industry, but still much remains to be done.

The handloom weaving industry of the province and the ancillary operations connected with it rank in importance and magnitude only next to agriculture. This industry from the standpoint of well-being of the rural population plays a conspicuous part as there are few occupations so remunerative as weaving to absorb the population not engaged in agriculture or to keep them occupied when there is no work in the fields. The Central Government realizing the need for assisting this industry, appointed some time ago a committee to go into the details of hardships of handloom workers and recommend remedies for their removal.

Fibres.—The important fibres are agave, ambadi, hemp, sisal and coir. The industries connected with these are ropes, cordage, matting, nets, etc. There should be great possibilities for the development of these industries. Travancore particularly has organized these industries on sound lines, its products such as coir matting and ropes are well known throughout the country.

Animal Products

Sheep.—Wool spinning and weaving of blankets and *kumblis*. The quality of wool in the province is poor. Interesting experiments towards improvement of breed of sheep to obtain superior quality and larger yield have been undertaken in several parts of India and this province should undertake improvement on their lines.

Sericulture

This industry, subsidiary to agriculture, has made good progress in Mysore, Kashmir, Bengal and Madras. Mr. Ramnath, a sericulturist from Mysore who surveyed the Bombay Province to report its suitability for growing mulberry and rearing silk-worms has indicated that great potentialities exist in certain areas for the development of sericulture and the Bombay Government acting on his recommendations, has opened a demonstration farm near Belgaum.

Recommendations

The recommendations of the Bombay Industrial and Economic Inquiry Committee should be considered and implemented if small-scale industries are to be placed on sound footing. Some of their important recommendations are:—

(i) Establishment of small-scale industries bank.
(ii) Comprehensive survey of resources with the object of starting new occupations and developing existing ones.
(iii) Technical aid and research.
(iv) Demonstration parties.
(v) Exhibitions, museums and sales depot to popularize cottage industries products.
(vi) Co-operative buying and selling.
(vi) Stores purchase policy to be so framed as to give preference to the products of local industries.

Conclusion

The growing pressure upon the land renders the development of small-scale and cottage industries imperative to the economic future of this province. Workers and artisans can help themselves to some extent through self-help and co-operative methods. But no permanent results can be achieved without the active help of the Government. The Government should, therefore, assign an important place for the problem of small-scale and cottage industries in their post-war rural uplift plan.

Sericulture in Travancore

THE Agricultural and Industrial Departments are engaged in the revival of the sericultural industry in Travancore. Experimental plantations of mulberry have been started at Pangode, in the premises of the Pattom and Kowdiar Palaces and also in the area adjoining the Reformatory and the Central Prison.

Experimental rearing of silk-worms was started in 1944 with 100 layings of seed eggs obtained from Coimbatore. 67½ lbs. of raw cocoons of high quality were produced, the output being comparable with those obtaining in Mysore and Coimbatore.

According to expert opinion, the soil and climatic conditions in many parts of Travancore are favourable for mulberry cultivation, and there is every possibility of establishing a flourishing sericultural industry in the State in the near future.

What is Nylon?*

TO attempt concisely to answer the question "what is nylon?" is rather like playing the parlour game known as "Animal, Vegetable or Mineral." Textiles may be vegetable like cotton and flax, and the fibres jute, hemp and ramie; or they may be on the animal side such as wool and silk. Nylon is definitely mineral, for in effect it is derived from coal, air and water. All the textile materials consist of long chain molecules, and in many cases science has as yet only a rough idea as to the build-up of these molecules. Nature is an adept in building-up long chain molecules. Man has only been getting down to the job over the last few decades, but already with a good measure of success.

Building-up Long Chains

When an ordinary salt is prepared from an acid and a base, the molecules so formed are usually quite simple ones and are not linked one with the other, but molecules of certain materials may be persuaded, by use of the right conditions, to link together to form a chain, just as it is possible to make a chain out of paper clips. Such a chain is called a polymer. If the molecules link up in a nice straight line and do not, as it were, eat their own tails, the chain is called a linear polymer. In other cases a molecule of one particular material may be made to link up with a molecule of another material, and so on, forming a mixed chain. It is in such manner that many materials coming to the fore to-day are made. If we consider the developments in the manufacture of the various sorts of synthetic rubbers, we can say that what is being done is that long molecules are being built up from small ones. In this way materials are produced which are rubber-like in their properties. These materials are at the present time all called "synthetic rubbers," but this is really a misnomer, for what is happening is that man is building up materials which have a somewhat similar structure to natural rubber, but not identical with it. Man is really manufacturing a variety of rubbers, each of which will have its special application.

In the textile field, man has been trying to emulate the silk-worm for generations. His efforts led first to the invention of what was originally called "artificial silk" and is now known as rayon. A number of artificial silks were made from cellulose, and as they developed it was seen that their acceptance by the public was held back by the word "artificial" which implied something *ersatz*. Accordingly, manufacturers and others coined for these materials the name "rayon" which has been generally accepted in America and, though to a far less degree, in England.

In making rayon man does not build up a long chain molecule, but makes use of the work which Nature has already done. He enters, as it were, at the half-way stage; thus, no matter whether he uses cotton or wood as the basic material he uses the long chains provided by Nature, and merely converts them into a usable form by modifying them under chemical treatment. Similarly, with casein fibres he uses long chains of proteins in milk produced by animals and modifies these to suit his purpose. With the nylons, on the other hand, he does not go to Nature for an already made chain. He builds one up himself. It will be noticed that reference is made to "nylons" themselves because nylon is actually a generic term covering a whole new series of products, possible hundreds in number, all built up from the same type of materials. The technical definition of nylon as adopted by the Patents Office is rather complicated:—

> "Nylon is a generic term for all synthetic fibre-forming polyamides, i.e., organic condensation products which contain a multiplicity of structural units linked in series by amide or thio-amide groupings produced by a process of manufacture in which non-fibre-forming organic substances of lower molecular weight are converted into products of such high molecular weight as to be capable of being formed into filaments which, upon cold drawing, acquire a true fibre structure recognisable by X-ray examination."

Actually, the structure of the nylons is similar to that of the proteins, at any rate to that structure which it is at present thought that proteins possess. Rayon was discovered because man tried to imitate the silk-worm, which can convert cellulose into a protein fibre. Man did not succeed in this and found that what he had done was to convert cellulose into usable form. Coming back to the question: "Animal, Vegetable or Mineral?" rayon is possibly most accurately classed as vegetable, or at best vegetable plus mineral.

---

*Press note released for publication by The Imperial Chemical Industries Ltd. in England.

How Nylons are Made

By no means all the nylons that can be made have yet been made. The particular nylon which forms the bulk of the present-day production is actually built up from a dibasic acid and a diamine. The acid is prepared either from phenol or from benzol, while the raw materials for the diamine are phenol or benzol and ammonia. Ammonia is, of course, made synthetically by causing hydrogen from water to unite with nitrogen from the air, while phenol and benzol are both derived from coal. Thus present-day nylon can truly be said to be produced from coal, air and water, no vegetable or animal product being employed.

Having obtained the acid and the diamine, these are combined in the same way that an acid is combined with an alkali to form a salt. This is called nylon salt, and it is an ordinary crystalline powder. The molecules of this salt, although containing a lot of atoms, are still small individual molecules, but when heated under the right conditions, proceed to link up to form long chains. In fact, care is needed to prevent the chains from becoming too long. In other words, molecules must be trimmed to the right length for the particular job in question. At the appropriate time the melted material, now called nylon polymer, is squeezed out and rapidly cooled.

In this form nylon polymer is hard, white and shiny, rather like a piece of flaked-off white enamel or a piece of cuttle-fish. Actually in this form the long chain molecules are all jumbled up together, whereas for use they should be arranged in an orderly fashion. The polymer is accordingly melted and forced through a small hole from which emerges a filament which is again rapidly cooled. The peculiar property of this filament is that it can be drawn out to many times its own length. During this cold drawing process the long chain molecules align themselves and the filament gets stronger all the time. When it has been drawn to a certain length, somewhere between four or seven times the original length, a further change takes place for, instead of being merely extensible, the filament suddenly becomes elastic. Similarly nylon yarn is elastic to a certain degree, and you can readily see why nylon yarn seems to be the ideal yarn for the manufacture of hosiery.

Properties of the Nylon

It is not yet known what properties will be forthcoming from the nylons yet to be discovered or what modifications can be made to the long chains once they have been formed, but there are bound to be many interesting developments, as interesting as they are important, during the course of the next ten years, if not sooner.

The properties of the yarn produced from present-day nylon are:—

(1) For a given denier nylon yarn is very much stronger than any of the other textile materials, including silk; thus nylon yarn has a strength of 6 grams per denier as compared with 3.8 grams per denier for raw silk. Steel has a strength of about 3.3 grams per denier.

(2) In addition to being stronger than silk, nylon yarn is also lighter, having a density of 1.14 compared with raw silk in the range 1.30-1.37 and boiled silk having a density of 1.25.

(3) It has a high melting point of about 480° F.

(4) Nylon yarn and monofil is practically as strong when wet as when dry.

(5) It absorbs but little water and thus dries readily.

(6) It does not burn—just melts.

(7) It is absolutely proof against attack from moth. In other words, Nature apparently realizes its mineral origin, and will have none of it.

(8) An interesting and important property of nylon yarn is that hot water or saturated steam imparts a substantial permanent "set" to nylon yarns and fabrics, i.e., if a nylon yarn or fabric is subjected to hot water or steam during manufacture it tends thereafter to retain the form in which it was during the steam or hot water treatment. Advantage is taken of

this property in making nylon hosiery, with the result that such hosiery, after repeated wear and washing fits the human leg as closely as when new.

Nylon is extremely hard-wearing and this property, together with its strength when wet, has led to the use of what is called nylon monofil as a replacement for bristles. Many people will by now have had experience of the durability of nylon monofil when used for tooth brushes. In the future, of course, these hard-wearing nylon bristles will be utilized in industry for bottle-washing machines, paint brushes, etc., and so on. Again nylon monofil is used as sutures, and there is nylon film and nylon enamels.

Nylon yarn is superior in strength and elasticity to the other textiles and is, in fact, in a class by itself. Nylon is used for purposes other than textiles. One can scarcely imagine a tooth brush, for example, let alone an industrial brush, being made of the usual textile materials.

A few words about the word "nylon" itself. Messrs. du Pont have been very anxious to point out that, apart from their desire to have a word ending with "on" —i.e., in line with cotton and rayon, there is no particular meaning behind the word itself which was chosen from many hundreds of suggestions. The word "nylon" should be spelt with a little "n" and should be used in an adjectival sense —thus, nylon yarn, nylon monofil, nylon sutures, nylon films, etc., except where the chemical itself is intended.

1. Nylon is a generic term just as glass is a generic term and covers products of particular origin just as rayon is a generic term covering yarns derived from cellulose.
2. The long chain molecules necessary for its properties as a textile are entirely built up by man.
3. Nylon polymer is capable of forming nylon yarn which has unique properties among the textiles, and is also capable of forming films, sheets, bristles and sutures.
4. The letters of the word "nylon" have no particular significance and the word should be spelt with a little "n" and not included in inverted commas. The word is not a trade-mark and should be used in an adjectival sense, such as nylon yarn, nylon monofil, nylon sutures, and so on, except where the chemical itself is being referred to.

Hosiery Industry and the Present War

By K. K. MADAN, *Hosiery Technologist, Cawnpore*

ALTHOUGH the present war has brought a boom to industry in general, the hosiery industry has received a setback and its existence is in jeopardy. The shortage of all sorts of hosiery needles has debarred the manufacturer from making even normal profits. At the present moment many factories are lying idle, some of them are running partially and very few are really working.

The needles, like other essential parts, could easily be manufactured by any enterprising capitalist. All sorts of parts have been made in our country and it is a strange thing that nobody has thought of this line. The available stock has been difficult to procure because of the advent of the black marketeer.

The menace of Japanese competition and dumping was at its climax when war broke out, and the manufacturer and technician in this industry were hoping for a better day as a result of the war, but were disappointed as the needles could not be made in India. The problem became very acute and the condition deteriorated to such an extent that most of the owners had to stop their factories even though the demand for goods grew many times and the profits were very lucrative.

Will any responsible person who has the welfare of this budding industry at heart think of reviving it? With Government's help we can well manage to bring it into line with other industries at a comparatively low cost.

Bombay Government Take Over Yarn Distribution

Other Control Notes and News

THE Government of Bombay have assumed complete control over the distribution of yarn in Bombay Province. In pursuance of this, the Provincial Textile Controller served an order freezing the stocks of yarn with 80 wholesale yarn merchants in Bombay City. These stocks will be distributed by the Provincial Textile Controller directly to the weaving and powerloom associations in the district.

The step was taken to bring under Government control stocks of yarn which had hitherto remained in the black market and beyond the reach of the small-scale handloom and powerloom weavers whose trade was almost paralysed for want of yarn.

Bombay Province requires a minimum of 14,000 bales of yarn a month to feed its handloom and powerloom industry. As the total yarn available for this purpose does not exceed the requirements, and as certain varieties are particularly sought after by the weavers, there is considerable competitive buying in the yarn market as also black market trading. The poorer class of weavers are unable to get any stock, with the result that their trade has been completely crippled. Further, much of the valuable commodity was frittered away in the manufacturing centres.

After several weeks' planning and careful consideration, the Provincial Textile Controller, Mr. J. K. Thakore, prepared a scheme for the distribution of yarn to weavers throughout the province and the machinery for it has been set up. Consumers in the northern division of the province between Viramgam and Surat are to be supplied from Ahmedabad with 2,000 bales of yarn. The rest of the province will be supplied from Bombay and Sholapur.

It is expected that 6,000 bales of yarn will come into the hands of the Provincial Controller as a result of the freezing of the stocks in Bombay.

The details of the new scheme of distribution of cloth, outlined by Mr. K. M. D. Thackersey, Chairman of the Textile Control Board, at the meeting of the Board held in Bombay on Thursday the 25th of January last*, were discussed at a conference of the Provincial Textile Controllers held in Bombay on Tuesday the 13th February 1945 and the following two days. Mr. M. K. Vellodi, Textile Commissioner, presided. The conference was attended by the representatives of the various provinces and of some of the Indian States including Hyderabad (Deccan), Mysore, Baroda and Indore.

The object of the conference was to elicit information on the difficulties of the Provincial Governments and the States in giving effect to the scheme with a view to making minor alterations to suit the convenience of the various administrations.

Registration of Transport Permits

On and from 5th February 1945, all transport permits and applications for the registration of movement of cotton piecegoods and yarn whether against war or standard cloth orders or for civil requirements from Bombay will be accepted for registration at the old G.I.P. Booking Office, Old Hanuman Lane, Mulji Jetha Market, Bombay.

No such applications for movement will be accepted at Shahibagh House, Office of the Textile Commissioner, from the above date.

Cotton Waste

By a notification in a *Gazette of India Extraordinary* dated 31st January 1945, the Government of India have, under powers conferred by sub-rule (5) of rule 75A of the Defence of India Rules, directed all those dealing in cotton waste to declare the stocks of cotton waste in their possession at the end of each calendar month, and at the same time to declare their commitments for the sale as well as for the purchase of cotton waste. The Order also requires them to state their total purchases during the year 1944. The declarations are to reach the office of the Textile Commissioner on or before the 10th of the succeeding month. The statement relative to total purchases of cotton waste during the year 1944 will accompany only the declarations as at 31st January 1945. The types of cotton waste to which this order applies are: (1) cop bottoms, (2) reeling waste (both white and coloured) and (3) sized waste (both grey and coloured), and all other hard waste including mixtures in any proportions.

The order applies to dealers only and not to cotton mills.

---

* Please see *Indian Textile Journal*, January 1945, p. 253.

C

Disposal of Cloth Stocks

The permission granted to dealers in the Bombay City and suburban area receiving goods directly from a manufacturer (quota holders) to dispose of 20 per cent. of their stocks to persons other than other quota holders or retailers is cancelled and all sales of such cloth by such persons may hereafter be made only in accordance with a written authority granted by the Textile Commissioner.

The Provincial Textile Controller will recommend to the Textile Commissioner to grant licences permitting dealers other than retailers within the Bombay Surplus Area to purchase a specific number of bales of such cloth and the Textile Commissioner will, on such recommendation, grant such authorities enabling such merchants to purchase from the quota holders a specific number of bales.

Printing of Cloth

According to the Bombay Hand Printers Licensing Order, 1944, which came into force in Bombay City and the Bombay Suburban District and certain areas in Ahmedabad District on 24th September 1944, no person other than the holder of a licence issued under the order can order printing of cloth from a licensed hand printer except under a permit issued by the Licensing Authority, which in the case of Bombay City and the Bombay Suburban District is the Provincial Textile Controller, Bombay, says the Public Relations Officer (Rationing).

Members of the public cannot, therefore, place an order for hand printing of cloth with a licensed printer without first obtaining a permit and no licensed printer can accept orders for such printing work without receiving such a permit from the customer.

Such permits can be obtained from the office of the Provincial Textile Controller at Kalachowki, Parel Road, Bombay.

Hand-dyed Cloth Under Control

Hand-dyed cotton cloth was hitherto exempted from the provision of clause 14 of the Cotton Cloth and Yarn (Control) Order, 1943, which prescribes the time limits for the disposal of stocks of cloth and yarn. The Textile Commissioner has decided to withdraw this exemption as from 27th January 1945.

Revised Processing Charges

A notification by the Textile Commissioner prescribing revised bleaching, dyeing, finishing and other processing charges applicable to all processors (other than those who are also manufacturers of the basic cloth or yarn) has been published in the *Gazette of India* dated 13th January 1945. The notification provides that the charges notified shall be applicable to all cloth and yarn to which the Cotton Cloth and Yarn (Control) Order applies. Copies of the revised schedule of charges have been issued to all mills and processors.

Cloth Export from India: Restrictions Tightened Up

The Government of India have decided to tighten up the restrictions on export of cloth in which the count of warp yarn is 36s or finer, and such cloth will hereafter be allowed to be exported only to the extent of a very small percentage of the production. A Press Note which contains this says that the Government decided upon the step in view of the shortage of supplies of fine cloth available for the civil market.

Shipments of fine cloth against export licences for cotton piecegoods already issued by Export Trade Controllers will only be allowed in cases where the cloth is proved to have been acquired for export against such licences before the date of this announcement.

Distribution of Cotton Seed: Zonal Scheme for Madras Province

A Press Note issued by the Board of Revenue (Civil Supplies Department), Madras, says:—

The Province of Madras is heavily deficit in cotton seed. With a view to conserving the available supplies, the Government issued orders in November 1943 prohibiting the export of cotton seed outside the Province, and to make up the deficit, arrangements are being made for imports from the Central Provinces and other places outside this Province. In order to prevent unnecessary cross movement, a zonal scheme for distribution of the seed within the Province has been drawn up in consultation with the Regional Controller of Railway Priorities, Madras. Under this scheme, the Province has been divided into the following five groups of districts:—

Zone 1: Vizagapatam, East Godavari, West Godavari, Kistna and Guntur.

Zone 2: Kurnool, Bellary, Anantapur, Cuddapah and Nellore.

Zone 3: Chingleput, Madras, South Arcot, Chittoor, North Arcot and Tanjore.

Zone 4: Salem, Coimbatore, Trichinopoly, Malabar and South Kanara.

Zone 5: Ramnad, Madura and Tinnevelly.

Of the five groups, Zones 1 and 5 are self-sufficient, and no movements from or into the zones will be allowed.

Zone 2 is surplus. The surplus from Bellary District alone will be allowed to move to the deficit districts in Zone 3.

Zones 3 and 4 are deficit and no movement of the seed will therefore be allowed to places outside these zones. To meet the deficit in these zones imports from outside the zones will be arranged for.

There will be no restrictions on the movement of the seed from one district to another within each zone. Any movement of the seed not in conformity with the above scheme will not be assisted by the railways.

Standard Cloth Sarees

After consulting the Provincial Advisory Committee for Standard Cloth, the Bombay Government have sanctioned a reduction, from 15th February in the prices of standard cloth seven-yard and eight-yard *sarees*, received against the first four allotments of standard cloth. The prices have been reduced from Rs. 3-9-9 to Rs. 2-12 for seven-yards *saris* and from Rs. 4-9 to Rs. 3-10 for eight-yard *saris*, says a press note from the Director of Information, Bombay.

New Profit Margins Fixed

The question of reallocating the margins in the sales of cloth and yarn among dealers in the various stages in the chain of distribution has been engaging the attention of the Textile Commissioner for some time now and he has in consultation with the Textile Control Board decided to change the existing margins. By a notification issued by the Textile Commissioner and published in the *Gazette of India Extraordinary* dated the 2nd February 1945, it is provided that quota holders should not sell cloth to anyone at a price exceeding 3 per cent. above the ex-mill price. Similarly, dealers who want to dispose of cloth to dealers in another zone are prohibited from charging more than 3 per cent. above the ex-mill price. The notification also provides that the wholesale prices applicable to all other transactions in cloth should not be in excess of 10 per cent. over the ex-mill prices. Another notification published in the *Gazette of India Extraordinary* of the same date provides for profit margins for the sale of yarn manufactured in India. For the purpose of determining the margins for the sale of yarn, it has been decided to group different counts of yarn into different categories and the profit margins have been fixed in relation to the groups and the nature of the transactions, depending upon whether the sale is between a manufacturer and a dealer; between a dealer and a dealer in bulk and whether the sale is wholesale or retail. The notification provides for the inclusion of the freight actually paid to the selling price subject to a maximum fixed by the notification.

In view of the above provisions, another notification issued in the *Gazette of India Extraordinary* of the same date deletes sub-clauses 3 and 4 of clause 12 of the Cotton Cloth and Yarn Control Order, which provided for different margins for the sale of cloth and yarn within and without the 100-mile limit of the manufacturing centre.

Stamping of Prices

The Government of India have amended clause 13 of the Cotton Cloth and Yarn (Control) Order, with a view to clarify the provisions of the existing clause. The clause as amended provides that no manufacturer or dealer shall stamp any marking which has not been specified by the Textile Commissioner or make any addition or alteration to the specified markings. Possession by any person of cloth or yarn with defaced or altered markings is an offence punishable with three years' imprisonment in addition to fine. Those who have got such cloth for *bona fide* personal requirements are not covered by this notification.

The same clause further provides that no manufacturer shall mark any cloth or yarn for which prices have not been fixed and notified by the Textile Commissioner except in cases where prices for such cloth or yarn have been submitted for approval to the Textile Commissioner and provisional prices have been supplied by the member of the Industry's Committee of the Board concerned, these prices may be stamped on the cloth or yarn, and will be deemed to be prices fixed and notified by the Textile Commissioner pending final decision in the matter. The latter provision, however, does not apply to those manufacturers who had less than 25 power looms on 1st January 1944 or to any processor.

◆

Cotton Plant Puller Propaganda

(*Concluded from page* 304)

puller was not at all a difficult rate once one is accustomed to the proper handling of the implement. In all such tests we asked the *kodali* cutters to enter; but only at one place did the operator with *kodali* enter the competition and was so soon outstripped by all plant puller entrants that he withdrew before even half his row was cut.

Ease of working the land after rain by other cultural implements where the plant puller has been used is so universally acknowledged that for many it is the reason for inclusion of the plant puller in their armoury of field implements.

Even in a measure like this, research and demonstration does not fulfil its object unless the practice is enforced on all by an Act of State. Foreseeing the need for such a measure, a Noxious Disease and Pest Control Act was passed by the Baroda Government in February 1940. It has been invoked to make the use of the plant puller compulsory.

For this purpose propaganda had to be made by wide circulation of leaflets and by talks with village leaders, revenue authorities and co-operative societies.

The area under cotton in the Baroda District is over 400,000 acres. The bulk of this is distributed in nine talukas and for facility of operation of the Act, it has been considered advisable to apply it in three stages, over 150,000 acres being taken up in Karjan, Sinor and Dabhoi in the first stage, over 100,000 acres in Sankheda, Tilakwada and Dabhoi in the second, and over 150,000 acres in the third stage in Waghodia, Padra and Savli; thus having all the cotton talukas of the district completely under the operation of the Act in 1944.

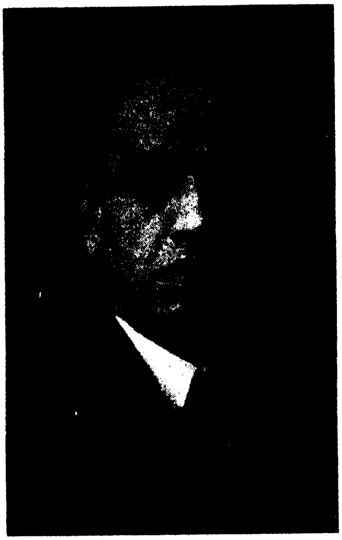
In actual working of the Act in the first stage last season, some difficulties of an administrative nature concerning tenancy and land-leasing practices were met with. It is hoped these have now been smoothed out by the help of the revenue authorities.

Special field staff had to be employed to see that the measure was being put into force. This was in addition to the assistance of the existing staff. Last season's experience was gratifying considering the difficulty of moving the usually inert mass in acting up to the requirements of the Act, and it is hoped that by 1944 every cotton cultivator will be so familiar with the operation of the measure that every one will automatically act up to it for the benefit of all concerned.

OUR PERSONAL COLUMN

The Millowners' Association, Bombay

Sir Vithal Chandavarkar, Kt., M.L.A., has been re-elected Chairman of the Millowners' Association, Bombay, for the year 1945. He is the Managing Director of Messrs. N. Sirur & Co., is a Director of several cotton mills in Bombay, Mysore and Hyderabad, and has been representing the Association in the Central Legislative Assembly since 1941. He was on the Committee of the Association for several years, was its Deputy Chairman in 1935 and Chairman in 1936, 1940, 1941, 1943 and 1944. He was formerly Mayor of Bombay, Vice-Chancellor of the University of Bombay and President of the Rotary Club of Bombay.



Mr. J. C. Lancashire, of Messrs. Forbes Forbes Campbell & Co., Ltd., has been re-elected Deputy Chairman of the Association for the year 1945. He is a Director of the Gokak and Simplex Mills and has been connected with the textile industry of this country in all phases of its production and distributive activities for over 25 years. He has been a member of the Committee of the Millowners' Association since September 1941.

The following have been elected to serve as members of the Committee of the Association for 1945:– Sir Ness Wadia, Sir Sorab Saklatvala, Messrs. A. Geddis, T. V. Baddeley, H. F. Milne, Dharamsey Mulraj Khatau, A. Pether, Neville N. Wadia, Krishnaraj M. D. Thackersey, G. D. Somani, L. F. H. Goodwin, H. G. H. Everitt, Ramniwas Ramnarain, Ramnath A. Podar, Bhagwandas C. Mehta, W. B. Bryden, Tansukhrai M. Karundia, and Navinchandra Mafatlal.

The Indian Merchants' Chamber, Bombay

Mr. M. A. Master, General Manager of the Scindia Steam Navigation Co., Ltd., was unanimously elected President of the Indian Merchants' Chamber, Bombay, for the current year.

Mr. Master has been a member of the Committee of the Chamber for a number of years and last year was Vice-President. He is a member of the Governing Body of the I.M.M.T.S. "Dufferin," the Shipping Policy Committee, and the Lighthouse Committee. He is also a trustee of the Port of Bombay, and has represented India at International Shipping Conferences. Prior to the flotation of the Scindia Steam Navigation Company he was connected with the management of the Sholapur Mills and the Morarjee Goculdas Mills, Bombay.

Mr. Mahomed Husein Hasham Premji, who has been elected as the Vice-President of the Chamber for the year 1945, is a graduate in History and Economics of the Bombay University. He joined his father in the family business of Messrs. Hasham Premji and has been at the head of the organization since 1936 when his father died. He has paid several visits not only to Burma and Ceylon but to England, France, Germany and other countries on the Continent. Messrs. Hasham Premji have extensive trade connections with the above countries and Africa and have interest in a variety of commodities including cotton, cotton-seeds, textiles, groundnuts, oil, tea, hessian, rice, grains, etc.

Mr. Premji represents the Federation of Indian Chambers of Commerce and Industry on the Foodgrains Prices Control Committee, the Foodgrains Procurement Committee and the Food Advisory Council and has been a sitting member of the Committee of the Indian Merchants' Chamber for the last six years.

The following members were declared elected to the Committee of the Chamber for 1945:–

Mr. Pranlal Devkaran Nanjee, Messrs. Pratapsinh, Mathuradas Vissanji, Ratilal M. Nanavati, Vijaysinh Govindji, Ratilal M. Gandhi, Sankalchand G. Shah, Mangaldas B. Mehta, Prof. Sohrab R. Davar, Messrs. Dawood Hajee Nasser, Amratlal Kalidas, Sarabhai Prataprai, R. G. Saraiya, Chimanlal B. Parikh, B. M. Bhargava, Mathuradas Canji Matani, C. S. Patel, Dhirajlal C. Modi, P. M. Chinai, Nandlal M. Bhuta, B. S. Dabke, Mohanlal A. Parikh, Haridas M. Parikh, and Vallabhdas Vasanji.

The engagement is announced between **Major P. W. Beardall,** I.A.O.C., eldest son of Mr. and Mrs. W. R. Beardall, Framton, Boston, Lincoln, and **Jean Marie Guthrie,** only daughter of Mr. F. Guthrie (Manager of the Century Mills, Bombay) and Mrs. Guthrie of Manchester and Bombay.

The Syndicate of the Bombay University have lent for a year the services of **Prof. C. N. Vakil,** Director, University School of Economics and Sociology, to the Government of India, to act as economist to the Planning and Development Department.

Seth Surajmal Gendalal Badjatia, millowner, industrialist and banker of Indore, is Managing Director of the Gendalal Mills, Ltd., Jalgaon, East Khandesh. Well known for his business instincts, at the age of 19 he was managing the finances of the Agra United Mills, where he came into contact with business men of high reputation. The training he had under his father, combined with his own innate ability, helped him to bring the firm to its present position. He also worked the Cambay Mills on lease very efficiently and made a name among millowners.

Seth Surajmal's personal charm is said to have won for him the trust and confidence of everybody and his devotion to duty and sound business instincts have only cemented the relations so formed. He has displayed a broad, progressive outlook in all walks of life. His philanthropic activities include running an Ayurvedic dispensary, donations to educational institutions, to temples and the poor. The welfare amenities provided in his mills are well spoken of.

Seth Surajmal is the President of the Bada Sarafa Cotton Association, Indore. He has not lagged behind in helping the war effort; his mills have been working on war orders and he has himself contributed generously to the war and Red Cross funds.

Mr. K. D. Guha, Director of Industries, C.P., has been appointed Deputy Industrial Adviser to the Department of Planning and Development, Government of India, from April next.

Mr. S. C. Joshi, a member of the Bombay Legislative Council and labour leader, has been appointed Labour Commissioner of the Government of India with headquarters at New Delhi. Mr. Joshi, an advocate of the Bombay High Court, is connected with the G.I.P. Railwaymen's Union, the Postal Employees' Union, the Reserve Bank Employees' Union and several other organizations. He is also the President of the All-India Railwaymen's Federation. He is relinquishing his leadership of all these labour organizations consequent on the acceptance of his new office.

This appointment is in pursuance of a scheme for appointing a Labour Commissioner and Deputy Labour Commissioners in different zones with a view to improving and strengthening the machinery for the conciliation of trade disputes arising in undertakings owned or controlled by the Central Government, including federal railways, mines, oilfields and major ports.

Mr. D. G. Jadhav, Conciliation Officer for the East Indian and the Bengal and Assam Railways, has been appointed to one of the posts of Deputy Labour Commissioners. Two more Deputy Labour Commissioners will be selected by the Federal Public Services Commission.

Memon Chamber of Commerce.—The following members have been elected office-bearers of the Memon Chamber of Commerce, Bombay, for the current year: Mr. H. H. Ismail, President; Messrs. Alhaj E. Mottiwala, Vice-President, Ganny Mohamed and Gulmohamed, Honorary Secretaries.

Mr. A. W. Percy, Manager of Burmah-Shell Oil Storage and Distributing Co. of India, Ltd., Bombay Branch, was unanimously elected Vice-President of the Bombay Chamber of Commerce for 1945-46. Mr. Percy has been a member of the Committee for the past few years and is at present Chairman of its Labour Sub-Committee. He is a Justice of the Peace.

Mr. Cassamally Munji has been unanimously elected President of the All-India Muslim Chamber of Commerce and Industry for the year 1945.

Sir Victor Sassoon, Bart., the well-known millowner of Bombay, has given Rs. 4,00,000 to the Governor of Bombay for the welfare of troops in the Bombay Presidency.

In making this very generous gift, Sir Victor says, in a letter to Sir John Colville, that he does so in response to the Prime Minister's statement in the House of Commons recently on the subject of the welfare of troops in India and that he is anxious that Bombay should lead the way in this matter.

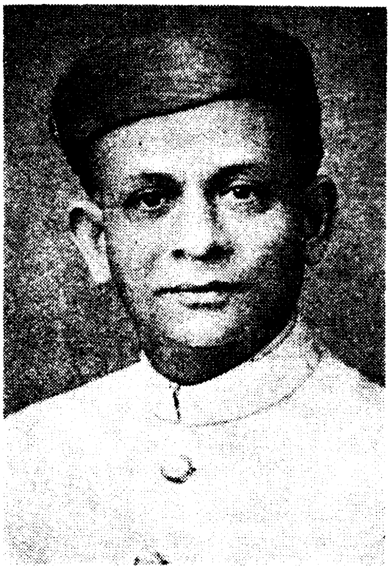
Mr. H. A. H. McGill, of Messrs. Platt Bros. & Co., Ltd. the well-known textile machinery manufacturers of Oldham, England, has been elected Chairman of the newly founded Russian trade section of the Manchester Chamber of Commerce.

Sheth Shantilal Mangaldas, well-known mill magnate of Ahmedabad, was the guest of honour at a luncheon party at the Taj Mahal Hotel, Bombay, arranged by his friends on the eve of his departure by plane to attend the opening ceremony of the first Overseas Branch of the Exchange Bank of India and Africa Ltd., at Colombo.

Sheth Shantibhai thanked all present for their good wishes and the honour done to him and said that the main object of the Exchange Bank of India and Africa Ltd. was to finance the import and export trade of India in its humble way.

Sheth Shantilal is connected with the management of four cotton mills, the Jehangir Vakil Mills and the Rustom Jehangir Vakil Mills, Ahmedabad, the New Jehangir Vakil Mills at Bhavnagar and the Navjivan Mills at Kalol. He has been representing the Ahmedabad Millowners' Association on the Bombay University Senate for several years and has served as a member of the Board of Visitors of the Department of Chemical Technology of the University of Bombay. He is a director of several textile concerns, insurance companies and banks.

Mr. Masturlal Chunilal Mehta, the Proprietor of Masturlal Chunilal & Co., Ahmedabad, a well-known firm dealing in mill stores, started business with small assets in the year 1936. Prior to this, he was a partner of the firm of Messrs. Narottamdas Chunilal & Co., and managed its affairs for a period of 20 years.



During his business career, Mr. Mehta has widely extended his firm's activities in the textile trade and to-day the firm can boast of its connections with several leading mills as suppliers of essential mill stores. Due to his longstanding and thorough experience coupled with skilled organization, he is highly popular in commercial circles.

The firm, which has its Bombay office at 73, Apollo Street, and is represented in other large textile centres also, has specialised in cotton ropes, English bobbins and Kenyon's woollen goods like roller and clearer cloths and sizing flannels. They are also stockists of bobbins and shuttles, healds, reeds and wire healds, leather goods like roller skins, picking bands, belting, etc., cotton ropes and bandings, cotton tapes, heald cord, etc., all of well-known English makes. They are also makers of the "Spin-well" brand of roller varnish.

Mr. Sashittal Nagesh Rao, Technical and Sales Manager of Das & Co., mill-stores, colours and chemical merchants, of Ahmedabad, proposes to make an extensive tour of Great Britain and the United States of America on behalf of his firm with the idea of forming new connections as well as renewing old ones to be ready for trade expansion during the post-war period. During his stay of about four months in the United Kingdom and another 4 months in the United States of America, he will get in touch with machinery manufacturers for selecting machinery for the manufacture of root starches and their products in this country; he will also select suitable plant for the making of materials useful for the textile industry in India.

Mr. Rao was a student of the V.J.T. Institute and has obtained the L.T.C. diploma and has passed the City and Guilds examination in dyeing, technology of oils, fats and waxes. Prior to his joining the firm of Das & Co. he was serving for a short period as an assistant in the Standard Mills and as Dyeing Master in the New China Mills. During his tour he will represent not only Das & Co., but also its sister concerns, the United Export and Import Company and Bhagwati Cotton Trading Company, etc.

Mr. V. Ethirajulu Naidu, formerly Spinning Master of the Raghuvanshi Mills, Bombay, has joined the Swadeshi Cotton and Flour Mills Ltd., Indore, since the middle of 1944 in the same capacity.

Trade Union Congress Working Committee.—The General Council of All-India Trade Union Congress has elected the following members to the Working Committee:– Messrs. B. T. Ranadive, F. E. Qurban, D. S. Vaidya, R. K. Bhogle, Bankim Mukerji, Rannen Sen, S. S. Yusuf, Gyanavikash Maitra, Kalayanasundaram, V. V. Giri, V. R. Kalappa, B. K. Mukerji, Dinker Desai, K. N. Joglekar and Viswanath Dubey.

Problems of Industrial Labour in India

Regulation of Wages by the State

In " The Regulation of Wages and Other Problems of Industrial Labour in India," Mr. D. R. Gadgil, M.A., M.Litt. (Cantab.), brings together the lectures delivered by him as Banaili Reader of the Patna University. Mr. Gadgil deals with wage-levels in theory and practice and with the effects of wage movements on the volume of employment at a given time. He then tackles the problem of the regulation of wages and proceeds further to cover the subjects of rationalization, industrialization and the standard of living. The following pages attempt a survey, to a large extent in the author's own words, of the work and its scope.*

WAGES being far and away the most important cause of industrial disputes in India, the determination of the size of the wage and the methods of paying it constitute the most vital problems relating to industrial labour. So far as the cotton mill labour market is concerned, collective bargaining has been more or less successful in Ahmedabad, but in Bombay, though trade union action has not been effective, the millowners have been regulating wage levels conjointly; elsewhere employer-employee organizations are yet very weak. Data regarding the wages of three important categories of time-workers, e.g., doffers, tarwallas and ring spinners, indicate that the level of wage rates is widely dissimilar in the different centres and regions of the Province of Bombay. It has also been found that, even in the same centre, the level of rates paid by the different units is not uniform. " The present working of the economic system in India," says Mr. Gadgil, " does not seem to bring about or even to tend to bring about a similar scale of charges levied on the product of the industry for similar service rendered to the industry." The variations are particularly wide in centres where, unlike in Ahmedabad, wages are unregulated. Commenting on these variations, Mr. Gadgil expresses the opinion that the usual assumptions on which a theory of wages has been built do not hold good in India and that there should therefore be no question of prescribing policy on the basis of that theory. In an ideally free labour market there should not be so many divergences as to call for the intervention of external forces in order to effect an " equitable distribution of resources and adjustment of payments."

Wages and Employment

Mr. Gadgil poses the question: How is the volume of employment in particular industries in India and the total volume of industrial employment likely to be affected by a movement of the wage rates? We must note, he says, certain peculiarities of the employment of industrial labour in India. It is working at a very low rate of efficiency, and so a wage increase may result in the substitution of machinery for labour (and therefore reduction in volume of employment) or it may increase standard of living and consequently efficiency (which might make it profitable to employ the same volume of labour as before at the higher rate). Another peculiarity is that increase in wage rates results in a falling off, at least temporarily, in the labour supply. But according to Mr. Gadgil there is little connection between higher wage rates and higher absenteeism. Employers maintain that wage rates and earnings have been steadily moving upwards during the last few decades. " If there was definite correlation," says Mr. Gadgil, " between higher earnings and higher absenteeism there should have been evident, *pari passu*, a tendency towards increased absenteeism during all this period, but no such tendency is even alleged to be in evidence."

Short-term repercussions of a wage increase on the volume of employment will vary with the measure of importance attached to wage costs in the total expenses of production. In the cotton textile industry of the province of Bombay, the costs of labour are between a fourth and a fifth of the cost of the finished product. In this industry, however, wage rates are stationary over comparatively long periods and the volume of employment offered varies over short periods by a lesser or greater resort to night shift working. The level of wage rates has little effect on these short-term adjustments in the extent of employment offered, adjustments which depend almost wholly on temporary changes in the state of trade and industry. If all considerations are properly weighed, it appears that movements of wage rates of a limited size should have little effect on increases in production or employment in industry during a short period.

Rationalization and Wages

Dealing with rationalization, Mr. Gadgil explains how it affects labour directly through changes in the technique of manufacture and in the methods of labour management. The aim of rationalization measures is generally the reduction of the cost of production per unit and the increase in the margin of profit, or alternatively diminution in the margin of loss. Labour cost in most industries is an important component of the cost structure. There are two ways in which this labour cost could be reduced. Either the rate of payment per unit of labour could be reduced or each unit of labour could be made to go farther in its productive effort by increasing its efficiency or by bringing about a reduction in the number of units of labour required in the different processes. The cotton textile industry in the city of Bombay entered a period of depression in 1924-25 which lasted for nearly a decade. The Tariff Board in 1927 reported that the level of wages in Bombay was one of the reasons for its lack of competitive power. But labour stoutly opposed any move to reduce wages, which was actually effected only in 1933-34. In these circumstances it was only to be expected that the millowners should have tried to reduce labour costs per unit of output by methods other than a direct cut in wage-rates. Each operative was asked to do more work or mind more machines than he was used to. Because the process of introducing labour-saving plant is a gradual one, it rarely results in the actual displacement of employed labour. The chief effect of such introduction is therefore one of not bringing about an expansion in the demand for labour to the same extent as might otherwise have taken place; this seems to have happened to some extent in Ahmedabad. In Bombay, on the other hand, rationalization creates an acute problem, for it leads to fear of direct unemployment among labourers, and that usually at times of trade depression.

---

* Published by the Gokhale Institute of Economics and Politics, Poona. Price: Rs. 5 or 10*s*.

> **" If," says Mr. Gadgil, " there is a strong feeling among the mass of workers against rationalization methods trade union leaders might find it inexpedient to co-operate actively in working out measures that are unpopular, because the appointment of experts on the side of labour places on labourers the responsibility of accepting ungrudgingly all the innovations to which their experts may agree. In the ring spinning department of Ahmedabad cotton mills rationalization was brought about by joint agreement between the Ahmedabad Millowners' Association and the Textile Labour Association, but it is now complained that the Labour Association is now taking up a *non-possumus* attitude in respect of proposals for the other departments.**

In Bombay rationalization, in the sense of intensification, has been taking place for more than a decade. Conditions in the rationalized departments have distinctly improved in recent years and complaints and disputes on this score are fewer in number now than they were a few years ago.

Regulation of Wages

There is enough evidence to question the existence under Indian conditions of a competitive or fair wage level or of any tendency towards the establishment of such a level. Other charges on or shares in the product of the industry, e.g., managing agents' remuneration, are also not determined in a consistent or a uniform manner. Proceeding, Mr. Gadgil observes: " Wages in India are determined not by the uniform operation of an inexorable economic law but by considerations of the particular circumstances of each locality and each unit; the forces of the economic market (of the economic theorist) operate only slowly and unevenly."

Non-interference with wages as a doctrine of State policy in India during the past has resulted in producing conditions not of an orderly competitive market but of chaos and disorder, in which unfair competition and low and uneven rates of wages have been prominent. *Laissez faire* having completely failed, we must have resort to regulation. The regulation of wages must become a normal feature of the industrial situation. So far the only measure undertaken by the State in India has been the Payment of Wages Act (1936), a useful piece of legislation which has prevented or minimized a number of abuses in connection with practices adopted by employers to effect indirect cuts in wages.

Low wages are the result of either (*a*) absolute low level of the total proceeds of the industry to be shared or (*b*) a low share of the proceeds accruing to the wage-earners. The former can be improved by increased industrial efficiency, the latter by improving labour's bargaining power or by outside interference. Several years ago the level of wages in the cotton mills of Ahmedabad was lower than in Bombay, but subsequently it became definitely higher; the industry in Ahmedabad has been expanding continuously, its production and employment figures having increased, the efficiency of the units has also increased as well as the efficiency of labour. The installation of modern plant and up-to-date labour-saving machinery has been a marked feature. Labour in Ahmedabad is also better organized than anywhere else in India. Collective bargaining and, to a certain extent, standardization of wages have been in force for several years in that centre.

Why Regulation Is Necessary in India

The regulation of wages in India is necessary because of (1) unduly low wages in particular occupations and units, (2) the undesirable effects of the possibility of the undercutting of wages by the employers and (3) the difficulties created by disparities in wage rates in the matter of preserving industrial peace. The less efficient employer must be forced to pay the same wage as the more efficient; also he would have no incentive to improve his methods and " would continue to produce on a scale larger than the one to which he is entitled."

The regulating agencies and measures are of three kinds: (1) Collective bargaining between both sides, (2) one-sided regulation by one party to the wage bargain, and (3) action by the State.

There is a general tendency at present to guarantee certain minimum conditions for labour universally by legislative action and to leave the rest to collective bargaining. But, in India, the only instance of collective agreement dealing with wage rates is the arrangement obtaining in the Ahmedabad cotton mill industry, and we cannot look to it for a wider application of collective agreements. One-sided regulation by either the workers themselves or by the employers is one alternative. In the province of Bombay, ever since the close of the last war, employers have been acting together in these matters. The Millowners' Association, Bombay, was responsible for preparing the scheme for the standardization of wages submitted to the Bombay Strike Enquiry Committee (1928-29). It was not, however, adopted, and chaotic wage conditions continued until 1934 when the Association introduced a schedule of minimum wages. This schedule was confined to certain important time-rated occupations, and its scope has been increased slightly in recent years. But obviously this is a regulation that is too one-sided and cannot, therefore, be recommended for wider application. Being framed and enforced by the employers themselves, it cannot be expected to inspire confidence in the workers, so that we are left with the other alternative of State action. With the great diversity of labour conditions in India it is not necessary, according to Mr. Gadgil, that a uniform system should operate throughout the country, but the Provincial Governments should see the desirability of having a similar policy in these matters.

Agency Best Suited to India

What, however, is the best type of wage regulation suited to India? Mr. Gadgil answers: Minimum wage fixing machinery. In India the rates of payment differ widely from unit to unit and some concerns pay a very low wage, and, therefore, a system of minimum wage regulation should be immediately introduced.

But what is the most suitable machinery for minimum wage regulation in India? Arbitration courts or trade boards? The experience of arbitral bodies elsewhere demonstrates the absence of any scientific or theoretical basis on which an absolutely just division of the proceeds of industry can be founded and on which an accurate assessment of wage levels can be made. In countries like Canada or Australia the desire for the protection of the national standard of living inevitably led to an attempt to lay down a general minimum level which had nothing to do with any particular occupation or industry. The problem in India, however, is to raise, by a series of particular measures, the standard of living of those in receipt of very low incomes. The concept of a single general minimum is, therefore, inapplicable to Indian conditions. We want wage-regulation in order to prevent an unduly low wage in certain occupational categories, to prevent the subsidizing of the low-wage-paying employer and to allay labour discontent. Wage regulation must, therefore, cover all the main occupational categories. The minimum wage schedule of the Millowners' Association, Bombay, covers all important classes of time-rated workers up to the rank of jobbers and supervisors, just as in the case of trade board lists in England.

Wage regulation in India must, therefore, take the form of schedules or lists of wages which lay down the minimum rates for all occupational categories of workers included in the industry for which the regulation is framed. "Scientific measurement of the difference in the type of work and effort called for from different classes of workers is possible within close limits, and wage rates for separate classes can be determined in a scientific manner following such a measurement of the differences in the quality of effort required." There are, however, several special difficulties in India. The first relates to the spread between the earnings of different classes of workers. The differences in payment to the unskilled, semi-skilled, and skilled, workers in India are disproportionate in comparison with the differences ruling elsewhere. These disparities are even greater when the level of payments to the manual workers is compared with levels of payments to the clerical, the technical, and the managerial staffs. But this disparity in earnings between the skilled and the unskilled is greater in the smaller centres of industry than in the larger ones. Thus "while the rates of payment to doffers and single-side ring siders are distinctly lower in Sholapur than in Bombay, the rates of payments to weavers in the two centres are almost the same." This is perhaps explained by the fact that, "while in the larger centres a fairly numerous class of semi-skilled and skilled workers has been built up in course of time, the paucity of skilled and semi-skilled workers continues to be marked in the smaller centres of the industry."

There are two ways in which these disparities can be acted upon from outside: the spread of general and technical education, and accurate methods of determining the differences in the quality of the work performed by the different classes of workers and fixing the corresponding money differences. But in Mr. Gadgil's experience, there is no unanimity among employers from the different centres on such points as the relative strenuousness of different kinds of work. Room for difference of opinion is even greater when it comes to detailed calculations regarding payments. The rates of payments for, e.g., the front-sider and the back-sider and to the drawer-in and the reacher-in in the different cotton mill centres in the Province of Bombay differ very considerably. When these differences are studied comparatively for the various centres in India, the divergence is found naturally to be even wider.

Trade Boards and Their Working

Mr. Gadgil's conclusion is "that rates of wages in industry are best determined by the representatives of employers and employees in the industry itself; for, an outsider who has no intimate knowledge of conditions in the industry is apt to go wrong." The most appropriate machinery for wage regulation would be that of a Trade Board, the majority of whose members will be composed in equal measure by representatives of employers and of workers. Minimum wage regulation through the machinery of Trade Boards would seem to be the most appropriate, particularly in view of the very great differences noticeable in the extent of development of the industry, the sources and nature of the available labour supply, and the state of organization among employers and labourers.

Maintaining Industrial Peace

Mr. Gadgil deals with the problem of maintaining industrial peace from the point of view of narrowing the grounds of possible differences of opinion by, e.g., the regularization and systematization of wage payments. Any measure that leads to a feeling of contentment among the working classes and to the creation of a confidence that they were, as individuals and as a class, being dealt with justly must automatically help the cause of industrial peace. There will, however, arise occasions on which a difference of opinion regarding the terms of a particular bargain will be evident between the two parties. The machinery and technique of maintaining industrial peace is particularly concerned on these occasions. In India the employers are as a rule stronger. Non-members of employers' organizations from among the constituent units of the industry are always few in number. On the other hand, the proportion of members of trade unions among individual workers is very small. This disparity in membership between employers' and workers' organizations is more marked in India than elsewhere. Indian labour leaders and organizers rarely come from the ranks of actual workers. Trade unions, too, have not generally found it possible or desirable " to give sufficient attention to organizing any common or corporative activities which might interest or help their members." Therefore many trade unions have laid themselves open to the charge of being no more than strike committees. Nor have the employers been helpful. They consider it worthwhile to incur even considerable immediate losses if they can permanently prevent an inconvenient union from coming into existence. They are unwilling to deal with the leaders of such organizations as exist and, when forced by circumstances or outside pressure to deal with them, they are anxious to withdraw from the position as soon as it is possible. This being so, the problem in India is one of " initially helping a proper organization of workers and obtaining for it the right to bargain collectively." Unfortunately, at present, the conduct of trade union affairs is largely influenced by extraneous considerations. There are two classes of labour leaders in this country: those whose political or other creeds simply colour their general policy and for whom the immediate interests of the trade union and the interests of its individual members are of paramount importance, and those others who are " primarily interested in a faith or a philosophy and its spread and to whom unionization of labour is an incident and a means to certain ultimate ends." " *We have mostly had so far the latter type of leadership prominent in our labour movement.*" And this, naturally, has determined the *sticking point* of the workers, which has often been fixed at too high a figure, owing perhaps to the outside leader's underestimating the positive cost to the workers of the struggle and his treating as very important the advantage that may accrue from the struggle apart from the particular point that is at issue. And, according to Mr. Gadgil, " Indian trade union leaders seem to have given considerable importance to this latter kind of negative costs." Outside leadership tends largely, therefore, in the direction of prolonged dislocation of industry and of an increase in the cost to the community of the industrial dispute. The solution of the problem is not simple ; what is wanted is " more literate, more educated and a more stable labour force capable of throwing up leaders from among itself."

Methods of Conciliation

There are three methods of intervention in industrial disputes: (1) Inquiry, (2) conciliation and (3) arbitration. An inquiry committee's report presents an expert independent review of the situation and its findings on it. The essential nature of conciliation, on the other hand, is not investigation or inquiry, but arranging to get the two parties together to effect a settlement. Conciliation may often succeed but is not always and necessarily effective. Arbitration, whether voluntary or compulsory, leads ordinarily to a final settlement, the arbitral award being binding on both the parties. " A committee of inquiry would tend to arrive at what appears to it to be the logical conclusions arising out of its review of the situation, but a board of arbitration must look not only to the logic but also to the workability of the award that it presents. It would ordinarily prefer a solution that appears workable and satisfactory to both parties to a solution that was merely correct."

Before the war of 1914-18 leaders of labour organizations in India were not adequately protected in law; the Trade Union Act of 1926 removed this difficulty, however. But the first legislative enactment providing for official intervention in labour disputes was the Trades Disputes Act of 1929. Almost no use was, however, made by Provincial Governments of the provisions under this Act regarding the appointment of boards of conciliation, and the Bombay Trade Disputes Act of 1934 sought to remedy this defect.

The Bombay Industrial Disputes Act, 1938

The Bombay Industrial Disputes Act of 1938 was a much more ambitious piece of legislation. These two Bombay Acts constitute the sole experiments in the sphere of machinery for the settlement of industrial disputes in India. Mr. Gadgil then examines the working of the 1934 Act and compares it with that of the 1938 Act. The least disputed feature of the latter Act is the provision for compulsory conciliation, before the completion of which any strike or lockout that may have been declared is illegal. In addition to conciliation, expected to be carried out by officers of the Government Labour Office, the Act of 1938 provides for the appointment of Boards of Conciliation for dealing with particular disputes. In this connection there are two different kinds of approach: the activities of the Ministry of Labour in England and of the Boards of Conciliation and Investigation of Canada. The work of the former is influenced by the principles of informality and privacy, and no reports are published. In Canada the Boards of Conciliation are *ad hoc* bodies which are not merely conciliatory bodies but investigating ones as well, and then reports are published. The Bombay Act of 1934 was built largely on the English model, but section 38 (4) of the 1938 Act lays down that the report of conciliation proceedings before officers of the Labour Office should be published; Mr. Gadgil considers it undesirable to require Government officials " to express definite opinions in public on matters that are matters of violent current controversy between capital and labour." He continues: " The position would not perhaps have been bad if the report could have been confined to a bare recital of the facts and the actual proceedings. Unfortunately, however, the form in which the Conciliator or Boards of Conciliation submit their report seems to be developing in a direction which is not warranted by the provisions of the Act." The Act " nowhere asks for the findings of a conciliator or board of conciliation." In spite of the clear wording of the Act, protests Mr. Gadgil, "Conciliators and Boards of Conciliation have in reports relating to recent disputes included elaborately argued findings and recommendations for the settlement of the disputes and these have been talked of as awards " by the public. **This is a clear case of misdirection of the machinery of conciliation.** By providing for the creation of a permanent industrial court the Bombay Act of 1938 creates for the first time in India permanent official machinery for arbitration between the two parties.

The Court of Industrial Arbitration created by the Bombay Act of 1938 has the advantage of being a permanent tribunal that should eliminate the delay involved in the constitution of *ad hoc* bodies and acquire intimacy with industrial questions and facility in dealing with them. But this arbitration is voluntary; official machinery is merely available to those who would avail themselves of it. Mr. Gadgil recognizes that the habit of referring disputes to arbitration can grow only slowly, and that an extension of State regulation by the introduction of compulsory arbitration cannot be thought of just yet. But under conditions of war, Government have taken a bold step and a Defence of India Rule provides for such compulsory arbitration. It remains to be seen how far this emergency regulation will survive when peace returns. Everyone will agree with Mr. Gadgil, however, that it is highly desirable to facilitate agreements between the two parties to submit all disputes between them to arbitration in the ordinary course.

Mr. Gadgil has some sound criticism to make of the provision in the 1938 Bombay Act regarding the legal rights of so-called "recognized" and "representative" unions. "The Registrar's power to declare occupations and areas," continues Mr. Gadgil, "might well be used in certain cases to give a union the status of a representative union artificially and *vice versa*. The provisions are not only illogical, but lend themselves, under given conditions, to manipulations by the party in power. It is therefore difficult to understand why the Act insists that all the representatives of the workers must be selected from among themselves." These provisions are illogical in conception and likely to prove retrograde in their effect on union organization. The procedure followed by the National Labour Relations Board in the U.S.A. should be our example, according to Mr. Gadgil. In the course of administering an elaborate set of rules for the conduct of elections and the determination of representation, the United States Board has to settle representation controversies between rival unions; but it settles the issue for each particular case and no permanent monopoly of representation is given to any particular organization. The Board does not countenance "the undemocratic principle embodied in the Bombay Act that there can at a time be only one registered union in one area and occupation . . ." This method is "simple, logical and fair and seems to be the only one suitable to India under present conditions." Another drawback in the Bombay Industrial Disputes Act of 1938 is that it makes no difference between individual disputes and group or collective disputes. On the other hand, in a country like India, where trade unions are neither strong nor well organized, some provision for dealing promptly with the grievances of individual workmen is specially necessary. As Mr. Gadgil shrewdly observes, "A prompt settlement of individual grievances is further desirable because collective disputes are apt to arise out of unredressed individual grievances." The institution of special machinery to deal promptly with individual complaints is even more necessary in India than that of machinery to deal with collective disputes. Mr. Gadgil then proceeds to offer some very helpful and constructive criticism of the present position of labour officers in mills and factories and indicates clearly the vast scope that there is for their increasing usefulness in the future.

Standard of Living

The standard of living affects the efficiency of the workers and labour efficiency is an important factor in determining the efficiency of the whole productive organization. The standard of living of Indian workers is one of poverty, extremely overcrowded and unhygienic home conditions, lack of privacy and ordinary family life, paucity of educational, medical or recreational facilities, chronic indebtedness, low money incomes and poor quality and insufficient quantity of food. Apart from directly measurable phenomena like the effects on efficiency of the installation of air-conditioning plants in cotton mills, no investigations have been conducted into the long-term effects of the conditions of living on efficiency. But experience has proved that wherever workers are specially well paid their efficiency is high. When one compares different centres of an industry the efficiency of workers is seen to vary usually with the level of wages paid to them; also when in a centre the level of wages is gradually increased the level of efficiency also increases, as in Ahmedabad.

In the matter of raising the standard of living action is possible in two ways: (1) regarding the wage paid by the employer, and (2) direct and indirect help given by the State or society to raise the standard of living. In India it is wages that determine almost solely the standard of living of workers. But there are limits to the possible action regarding wages, for, as pointed out by Mr. Gadgil, "the economic wage, i.e., the wage that under existing arrangements and in the present economic structure a worker may obtain, is limited by the total product of the industry in which the worker is employed. The total net product of the industry is subject to certain deductions before one can arrive at the total that may be paid out in wages," and there are limits below which these deductions cannot be forced. The total product of the industry is itself the result of the general character of the productive organization, an improvement in the nature and efficiency of which can take place only slowly.

Wage-regulation, however, is necessary to enforce payment of the wage that under existing arrangements is economically possible and proper. The remaining action must be taken by the State. "The wage depends mainly on the effort put forward by the worker and his service to industry: it will have little to do with his individual needs or standard of living. Social action which aims at increasing the standard of living must adopt different criteria." State action in this respect refers usually to separate aspects of the standard of living of the workers and caters for specific needs in each of these aspects. For this purpose direct money payments may be necessary, specially in circumstances where money payment is the most appropriate form of help. Examples of such money payments are outdoor poor relief, old age pensions and family allowances.

Mr. Gadgil then goes on to indicate the directions in which State action towards raising the standard of living would be fruitful, such as education, nutrition, housing, and health.

Cambridge Textile Extensometer

THIS instrument manufactured by **Cambridge Instrument Co., Ltd., 13 Grosvenor Place, London, England,** is suitable for testing almost every type of textile fibre and yarn. It records on rectangular co-ordinates the relation between load and extension of textile fibres, threads and yarns, with increasing and decreasing loads. The specimen being tested can, if necessary, be immersed in a liquid or in a box containing air with a known humidity. Included in the load-extension relationship are such factors as ultimate strength and extension, and hysteresis loss arising from different behaviour during the loading and unloading. The instrument may be operated at a constant rate of loading or a constant rate of extension of the specimen, as desired, the change-over from one type of testing to another being effected very rapidly by means of a switch. The instrument is worked entirely from the A.C. mains, and all electrical contact troubles are avoided by the use of a thyratron or gas-filled relay in the control circuit.

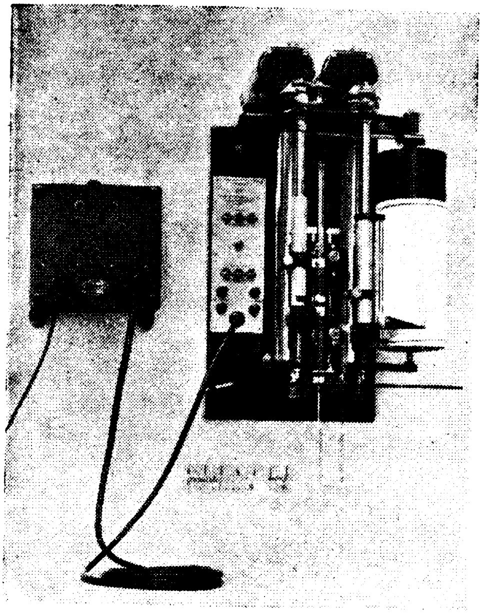


Fig. 1. 24 × 14 × 12 inches—90 lbs.

The extensometer is illustrated in Fig. 1 and is shown diagrammatically in Fig. 2. The basic principle is that the specimen under test and a spring are simultaneously extended by independent means, an electrical contact device keeping their tensions equal. The specimen A is extended by means of the motor W and tension screw B on the left-hand side of the instrument. The spring C is extended by means of a similar motor W_1 and screw D on the right-hand side. One motor (normally the " spring " motor) runs at a constant speed while the other is switched on and off by the sensitive tension-equalising switch E, situated between the spring and the specimen under test. The second motor and gears are adjusted so that if left on continuously they give a speed higher than the maximum required in the test, but the speed is reduced to give equality of tensions by intermittent supply of current through the switch E. The functioning of this switch is so rapid that the motor usually turns at a reasonably uniform speed and produces a smooth record. Two interchangeable sensitive switches are supplied with each instrument, one delicate enough for work on single fibres and the other suitable for use with yarns having breaking loads up to about 3 lbs.

The drum F, which carries the squared paper on which the record is drawn, is driven from the screw B by a double worm gear drive so that its surface movement is either equal to, or five times as great as, the extension of the specimen, the change of ratio being effected by a simple interchange of wheels. The carriage H which runs on the screw D carries a pen J, whose movement is equal to the extension of the spring and, therefore, proportional to the load. The pen thus records the load-extension curve on rectangular co-ordinates.

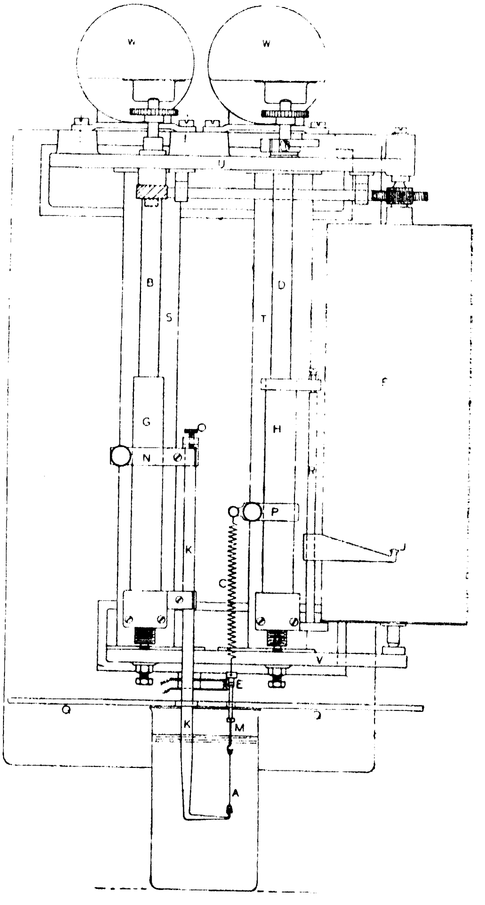

Fig. 2.

The specimen under test is arranged to project downwards below the instrument, and can, therefore, be immersed in a hot or cold liquid or in a humidity chamber. The specimen is carried between a hook-shaped stainless steel member K and a thin rod M which is attached to the sensitive switch. Interchangeable grips for holding fibres, yarns and narrow strips of film are provided. All these parts are made of materials which are highly resistant to corrosion. The adjustment of clamp N on the carriage G allows any reasonable length of fibre to be used, and similarly, the clamp P allows considerable latitude in the length of the spring. Calibrated springs of widely different strengths can, therefore, be readily accommodated. The member K and the rod M pass through a sheet of bakelised material Q, which serves to protect the instrument from vapour and from splashes of any liquid in which the specimen may be immersed.

The drum F is held by a spring plunger and is easily removable from the frame. The pen J can be swung away from the drum when desired and will remain about 1 inch clear. Further, it can be moved into alternative positions along the rod R in order to allow a number of records, starting at any desired distance apart, to be taken on one sheet of paper.

The main framework of the instrument consists of two substantial steel tubes S and T, supported by two end castings U and V, the whole being fastened down to a metal base by means of four feet. The motors W W_1 are mounted on the top casting U and drive through change wheels similar to those on a screw-cutting lathe. They are geared down to 25 r.p.m. on their driving shafts, giving screw speeds of 2.77-225 r.p.m. The pitch of the screw is 1/20th of an inch; a wide range of speeds is thus obtainable. For the interrupted motor these figures represent the maximum speed for any given set of wheels. If a finer adjustment of speed should be found necessary, rheostats can be inserted in the motor circuits, and terminals for the connection of these are provided on the panel.

The instrument is operated from the A.C. mains through a transformer and rectifier unit (not shown in the illustration). This unit also contains a thyratron or gas-filled relay valve, interposed between the sensitive switch E and the controlled motor, which reduces the electrical load on the switch contacts and eliminates contact trouble. All the control switches are mounted on the panel on the left-hand side of the instrument. One switch starts and stops the instrument while the other two define respectively the direction of running and which motor runs at constant speed. Four adjustable limit switches automatically stop the respective motors when the carriages G and H reach any desired point, and in any event before the end of the screw thread is reached.

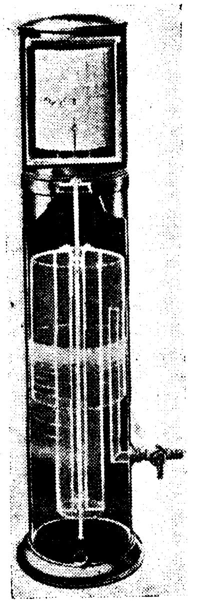
Sensitive Recording Draught Gauges

FOR the efficient operation of steam-boiler plant the use of recording draught gauges connected to various " key " points, such as in the case, for example, of Lancashire boilers over the fires, before and after the economizer, and at the chimney base or fan inlet, is an obvious advantage, and in this connection a notable instrument is the " Arkon " draught recorder, made by Walker, Crosweller & Co., Ltd., Cheltenham (Glos.), England.

The instrument is in the form of a neat vertical sheet metal cylinder, with a chart and pen mechanism in the upper portion, formed with a large window. Dimensions of the cylinder are 8″ diameter with a base of 10″, and various heights depending on the range of the chart required. Thus, for example, when reading up to a total of 0.6″ W.G. to 100th of an inch the overall height of the instrument is 37¼″, whereas a larger size chart, reading up to 4″ W.G., has an overall height of 39¾″.

Essentially the arrangement consists of an inner brass sheet metal float, operating in an outer brass casing, in the form of an inverted bell, suspended in water which rises or falls according to the degree of the draught, that is the suction, a ⅛″ diameter pipe being connected to the instrument so that it projects vertically into the upper portion of the float surface, above the level of the water. As the float moves it actuates the pen rod and pen, which records upon a chart wrapped round a clockwork-driven drum in the upper portion, the chart being rectangular in shape, 18″ long and 6″ working height, with uniform horizontal divisions, so that, as already mentioned, the curve can be read to 0.01″ W.G. Because of the correct proportion between the size and weight of the floating bell the movement of the latter may be as much as ten times the direct measurement of the suction, whilst another important point is that the pen is directly attached to the float with no links or levers, which would considerably increase the friction. Further, the complete recorder is coated with black crystalline stoved enamel, whilst the standard clock used, of strong and reliable construction, makes one revolution in 24 hours and runs for seven days at one winding.

In this connection the firm make a complete range of portable, fixed, indicating, and recording gauges for air and other gases, including the sensitive inclined water-gauge type reading to one hundredth of an inch W.G. These instruments can be used with advantage for controlling air supply for combustion in all types of furnace setting as well as for gas when this is used as fuel.



"Arkon" Recording Draught Gauge.

Indian Cotton Review for 1943-44 *

Production and Supply

THE area under cotton during 1943-44 was finally estimated by the Government at 20,398,000 acres, against 19,203,000 (revised) acres in 1942-43. The 1943-44 crop was estimated by the Government at 5,094,000 bales (revised), against 4,702,000 bales (revised) in 1942-43. Thus the 1943-44 acreage and crop respectively were 6 per cent. and 8 per cent. above the revised estimates for the previous season. The yield per acre worked out at 100 lbs. per acre, compared with 98 lbs. in 1942-43.

Excepting in Karnatak and Indian States, the acreage decreased everywhere in the Bombay Province owing to the grow-more-food campaign. In the Central Provinces and Berar, the switch-over to medium-staple cottons continued but the total acreage was down. In Madras, the decrease in acreage was attributed in part to the prohibition of cultivation of *Mungari* or early cotton. Amongst the notable increases in acreage over the previous season, 1942-43, were those in the Punjab (+14 per cent.), Sind (+23 per cent.), U. P. (+17 per cent.), and the Hyderabad State (+39 per cent.). Being a surplus product of food-grains, the increase in acreage under short-staples that took place in the Punjab was practically ignored. In Sind, most of the increase took place under American seed cotton. In U. P. acreage under short-staples increased owing to high cotton prices of the previous year. In the Hyderabad State the increase in the acreage under short-staples was the highest obviously because the State's " grow-more-food " propaganda failed to reach the actual farming classes.

The pride of place for the highest per-acre yield for the season easily went to the irrigated areas of Sind. The highest per-acre yield of 238 lbs. was registered under Sind Deshi, while the next best was Sind-American with 236 lbs. per acre. Amongst the monsoon-feds, Broach, Surti and Gujerat Dholleras behaved the best of all with respective per-acre yields of 133 lbs., 104 lbs. and 109 lbs. C. P. and Berar Verums showed better results at 83 lbs. per acre against 67 lbs. per acre in 1942-43. Amongst the worst sufferers were the Southerns which showed yields varying between 41 lbs. to 55 lbs. per acre.

Roughly classified into various staple length groups, the production of medium-staple cotton during 1943-44 formed about 62 per cent. of the officially estimated crop, compared with 60 per cent. in 1942-43 and 45 per cent. in 1941-42.

As regards the actual size of the 1943-44 crop, there is no reason to suspect the near accuracy of the Government crop forecast which placed the crop at 5,094,000 bales. The season's total cotton pressings amounted to 4,970,000 bales and the lag between the crop estimate and pressings was insignificant. That is not to suggest that the Government estimation was altogether faultless. The fault could not but be there; but the margin of error appears to be very narrow which is obviously the result of the employment of revised standard yield figures.

Taking the non-factory consumption of about 350,000 bales into consideration, private sources have estimated the 1943-44 crop at about 5,450,000 bales which is 650,000 bales in excess of the private estimate for the previous season.

The season's world supply of Indian cotton, on the basis of private estimates and inclusive of the previous season's carryover (revised) of 2,975,000 bales, should have amounted to 8,425,000 bales, compared with 7,800,000 bales in 1942-43.

Imports of Foreign Cotton

Imports were almost equal to or a little in excess of the previous season's imports of over 500,000 bales. Whereas imports of Egyptians at about 235,000 bales were approximately 27 per cent. less than the previous season, imports of Soudanese and East African cottons at about 80,000 bales and 120,000 bales respectively were approximately 120 per cent. and 40 per cent. higher than the previous season. India continued to be, as in the past, the A-1 customer of East African cottons.

Consumption at its Second Best in History

Mills in India consumed 4,125,000 bales of Indian raw cotton during 1943-44 as compared with the all-time record of 4,307,000 (revised) bales in 1942-43. This was due to the fact that the Indian cotton textile industry could not produce to capacity because of (a) the increasingly difficult position in respect of coal supplies in certain manufacturing areas, which compelled at places either the use of wood as fuel, or entire closure of operations for some weeks, if not months ; (*b*) the restricted supplies of essential stores, and (*c*) the comparative shortage of trained labour.

Total production of piecegoods during the year made an all-time record at about 4,800 million yards (estimate), compared with 4,236 million yards in 1942-43. The increase in production is reflective of increased weaving activity as compared with the previous season when production in leading centres underwent continued interruption and dislocation owing to political activity in the country and resulted in huge stocks of yarn being carried over into the season under review. Of the estimated production of 4,800 million yards, about 500 million yards were earmarked for exports while the Defence Services monopolised about 700 million yards. The estimated 1943-44 exports of 500 million yards compared with 606 million yards in 1942-43 and 944 million yards in 1941-42.

Consumption of foreign raw cottons in India during 1943-44, on the whole, continued well and is provisionally estimated at around 600,000 bales, compared with 609,000 bales (revised) in 1942-43 and the all-time record of 716,000 bales touched in 1941-42. Use of foreign cottons was well-balanced and was well facilitated through the scheme of allocations which allotted supplies to mills from time to time at defined prices with due regard to their actual individual requirements. Moreover, equitable distribution of foreign cotton stocks of all descriptions held within the country was also facilitated by the ban on sales of foreign cotton except on the strength of a licence issued under the Foreign Cotton Control Order, 1944. Mill consumption of all cottons in India during the season 1943-44 thus amounted to roughly 4,725,000 bales, which compared with the all-time record of 4,890,000 bales (revised) touched in 1942-43 and 4,741,000 bales in 1941-42.

---

* Published by Chunilal Mehta & Co., Ltd., 51, Marwari Bazar, Bombay.

The total world consumption of Indian raw cotton can be estimated at 4,775,000 bales, compared with 4,812,000 bales in 1942-43, indicating an average monthly consumption rate of 398,000 bales in 1943-44, as compared with 401,000 bales (revised) in 1942-43 and 450,000 bales in 1941-42.

The net 1943-44 exports of Indian cotton to foreign countries were considerably below the peace-time norm. But at about 300,000 bales, these compared well with the all-time low record of 155,000 bales (revised) touched in 1942-43.

Burdensome Carry-over

World's carry-over of Indian raw cotton as on 1st September, 1944 is roughly being estimated at 3,650,000 bales, compared with 2,975,000 bales (revised) a year ago. Of this, approximately 3,550,000 bales containing a burdensome percentage of short-staple and old crop cottons were concentrated in India, compared with 2,875,000 bales (revised) a year ago.

Looking Ahead

The balance-sheet of Indian cotton as at the end of the season 1943-44 is as under :—

INDIAN COTTON BALANCE SHEET
(Exclusive of Foreign Growths)
(Approximate Figures).

Supply throughout India :—		400 lbs. bales
All-India Carry-over as on 1st September 1943.		2,875,000
Approximate crop, 1943-44		5,450,000
Total supply for the season . ..		8,325,000
Distribution—	Bales	
All-India exports (inclusive of Kathiawar ports)	300,000	
All-India mill consumption ..	4,125,000	
Extras for hand-spinning, etc. ..	350,000	
Total distribution		4,775,000
Balance carried over throughout India as on 1st September 1944		3,550,000
Of this carry-over Government of India own about		275,000
" Free " cotton left with the mills and trade..		3,275,00

The situation is bad enough. However, the relatively low production expected during the current season (1944-45) should act as a corrective. In view of the strict enforcement of the Growth-of-Food Crops Act in the Khandesh and other areas, the acreage under cotton in the Bombay Province is expected to be much less than in the previous season. The Hyderabad State also promises to show a reduction of about 30 per cent. in acreage under cotton. Owing to the general food shortage, the relatively disappointing prices for cotton and the increased costs of cotton production, acreage under cotton in other Provinces and States excepting Sind, the Punjab and Madras, is also likely to show a sizeable reduction. Assuming, therefore, that total acreage during the season 1944-45 will be 10 to 15 per cent. less than the previous season, a crop of about 4,500,000 bales can be expected to be raised in 1944-45, which would compare with the private estimate of the 1943-44 crop of 5,450,000 bales.

The total available supply during the season 1944-45, including the carry-over of 3,550,000 bales, should thus amount to about 8,050,000 bales, compared with the 1943-44 supply of 8,325,000 bales.

Victory for the Allies is no doubt in sight ; but the essential factor is the time that would elapse between now and the actual end of hostilities. For aught one knows and thinks, hostilities in Europe can be expected to end any time between now and the first few months of 1945. But the war in the Far East, according to military experts, may take a couple of years to terminate. In that eventuality, firstly, the Supply Department's orders for cloth in 1944-45 can be expected easily to surpass the 1943-44 total mainly because India is the biggest accredited supply base for the Allies in the East and because increased troop movements would mean increased re-equipment demand for Indian cloth. Secondly, the end of the war in Europe would release the pent-up demand from the ill-clad populations of liberated countries in Europe. Looking to the way in which industrial establishments almost in the whole of Europe have been erased first by Germany and then by the Allies, this post-war demand for textiles will have to be taken care of by the United Kingdom or the United States. Under the circumstances, the possibility of these two big producers carrying competition with Indian textiles in the Indian market itself is very remote, at least during the initial portion of the post-war period. Thirdly, the position of Indian textiles in the foreign markets acquired during the war may be somewhat difficult in the long run. But in the near future, there is nothing in the situation to apprehend a loss of these markets and even if a slack in export demand develops, the Indian population itself, which was compelled during war-time to make only frugal purchases of cloth, can be expected to make good the void created in the export demand for Indian textiles. Fourthly, so long as the war lasts there is no reason to apprehend that the profit-stimulant would be lost. It has to be noted in this connection that the whole plan of war-time control over the Indian textile industry is based on the principle of profit for all, that is profit even for the least efficient mill. Nothing has so far happened to suspect that this principle would be given up all of a sudden. Finally, on the assumption that the current shortages in respect of fuel, millstores, machinery parts, etc., would not be allowed to disrupt the full-time working of mills, one ventures the guess that consumption of Indian raw cotton in India during the season 1944-45 may amount to 4,250,000 bales, or about 125,000 bales in excess of the 1943-44 figure of 4,125,000 bales.

As regards exports to foreign countries, the policy of economic warfare adopted by the U.S. legislature by empowering the U.S. Government to sell U.S. cotton at world competitive prices has greatly disappointed India in her expectation that the post-war period would mean better prices for an increased offtake of Indian cotton. The U.S. Government have been authorized by the aforesaid legislation to sell Government-owned cotton to the extent of 1 million to 1½ million bales at competitive world prices. This, in practice, would mean the adoption of the theory of two prices. The home price would be the 1928-peak at which the U.S. Government have promised to buy the whole of the 1944 crop in U.S.A. while the export price will be roughly 4 cents lower in accordance with the latest announcement. Such subsidized exports cannot but strangulate Indian cotton exports unless timely efforts are made by the Government of India to arrive at an amicable settlement with the United States and to secure for India her right to export cotton on the pre-war *pro-rata* basis. If such a right to export on the basis of pre-war *pro-rata* basis is secured, then alone can India expect, after the end of the war in Europe, to export to U. K. and the Continent the pre-war (1938-39) volume of Indian cotton, namely, about 1,299,000 bales. As, however, the war in Europe is yet continuing and it will take considerable time for rehabilitating the mill industry in liberated countries, possible exports in 1944-45 to U.K. and other countries cannot be expected to exceed 600,000 bales at their optimum. The question of the restoration of our biggest pre-war customers, namely, China and Japan, does not at all arise at the moment as both the countries at the moment are in the throes of war. Even if the war in the Far East ends earlier than expected, it is unlikely that the Japanese mill industry would be left unscathed in view of the heavy allied pounding of Japan's industrial centres that may finally eventuate. Under the circumstances, export prospects for Indian raw cotton cannot but be considered to be disappointing.

With domestic mill consumption at about 4,250,000 bales, exports at 600,000 bales and private consumption at homes in India of 350,000 bales, the distribution of Indian cotton in 1944-45 may amount to about 5,200,000 bales. Deducting this from the season's estimated supply of 8,050,000 bales, the carry-over as at the end of the season 1944-45 should work out at about 2,850,000 bales as against the estimated carry-over of about 3,550,000 bales at the end of the season 1943-44.

Post-war Prospects for Indian Cotton

Post-war prospects for Indian cotton are, indeed, gloomy if steps are not taken to plan Indian agriculture on a modern basis. Efforts, no doubt, have been made to draft post-war agricultural reconstruction schemes. But, with due deference to those who drafted them, it has to be stated that raw cotton has received a step-motherly treatment at their hands and, it has, for all practical purposes, been isolated from the purview of the various schemes. The report of Dr. William Burns, D.Sc., C.I.E., late Agricultural Commissioner with the Government of India, on the technological possibilities of agricultural development is an instance in point. **If, as he has recommended, the average yield of rice in India can be raised by 30 to 50 per cent., that of wheat can be raised from 640 lbs. per acre to 1,200 lbs. and that of sugarcane can be raised from 15 tons to 30 tons and even to 50 tons, there is certainly equal scope for the per-acre yield of cotton to increase from the 30-year average of 90 lbs. to, say, 150 lbs. per acre. It is regrettable, however, that Dr. W. Burns should have refrained from placing any target for raw cotton on the specious plea that cotton was a matter of national and international policy.**

In fact, cotton yields can be greatly improved by modern methods of intensified agriculture. That an acre produces 293.3 lbs. (as in the current season) of lint in U.S.A., 531 lbs. in Egypt and 277 lbs. in Anglo-Egyptian Soudan is the very reason why a cut-and-dried reconstruction scheme is needed to improve the per-acre yields of and post-war prospects for Indian raw cotton. For, firstly, an increased yield per acre would automatically lessen the costs of production thereby making cotton growing a business proposition to the producer and, secondly, it would raise the competitive capacity of Indian cotton in the world's markets. Finally, the national aspect of the post-war cotton policy would be to make the industry of cotton production a business proposition for the farmer and the international aspect would be to secure for Indian cotton the right to have export markets on the pre-war *pro-rata* basis.

As regards prices, raw cotton has been the worst sufferer during the past two seasons. Increased and increasing emphasis has been laid on the need to raise the production of foodstuffs and queer and unjust methods have been adopted to discourage the cultivation of raw cotton and to switch over the acreage under cotton to food. No one disputes or has ever disputed the war-time necessity for growing food in adequate quantities in India. But the method of approach to the problem adopted by the authorities has been seriously defective and even vindictive in the case of cotton. To put it bluntly, there is absolutely no need any more to increase the acreage under foodgrains. Even the current acreage is quite enough to produce at least 25 per cent. more of food-grains, provided, modern implements of agriculture and fertilisers are supplied to the farmers at cheap cost. Similarly, and on the same basis, even the presently reduced cotton acreage is quite adequate to produce a crop that will cover both the national and international demand for cotton at relatively economic world prices. Instead of moving in the direction discussed above, the authorities have only placed undue emphasis on the switchover of acreages from cash crops like cotton to food crops and have even placed price deterrents in the way of growing cotton. The most condemnable feature of the grow-more-food campaign and the Bombay Government's " Growth of Food Crops Act " is that the acreage switchovers have been or are sought to be attained at the cost and sacrifice of the cotton farmer and without paying him adequate monetary compensation for the self-denial involved.

In respect of their price policy for the 1944-45 season, the Government of India have gone a step further. They have entirely excluded not only short-staple cottons from their purview, but they have also ignored the ¾″ staples like the Dholleras and Kalagins by not fixing floors for them. In short, the policy of the Government of India appears to be to water down the price level of cotton and to perpetuate the step-motherly treatment offered to it so far. Under the circumstances, one should hardly feel surprised if the ceilings and floors for the 1945-46 season are still further reduced by them under the plea of anti-inflationary effort.

Annual Sports Meeting of the Dawn Mills Sports Club

The Sir Percival David Volley Ball Tournament

THE annual sports meeting of the Dawn Mills Sports Club, Bombay, was held in the Dawn Mills compound on 2nd February at 5-30 p.m. Mr. L. H. Lawford, Managing Director of the mill, presided. A large gathering was present and a specially erected shamiana accommodated the distinguished guests of the evening.

The principal event of the evening was the final match of the Sir Percival David Volley Ball Tournament. This tournament, conducted by the Dawn Mills Sports Club, was open to all clubs in the city of Bombay and suburbs. The Dawn Mills Sports Club and the Delisle Road Welfare Centre met in the finals and the match between them was of a high standard and proved interesting. The Dawn Mills won the match in two straight games, the scores being 15—12, 15—5.

In the first game the Delisle Road Welfare Centre put up a stout fight. Their defence was good but their attack proved ineffective. Their smashes were invariably blocked just over the net by Dwarka, the outstanding smasher and defender of the Dawn Mills team. Encouraged by their victory in the first game, the Dawn Mills played splendidly in the second, and completely outplayed their opponents, who were too tired and nervous to offer any appreciable resistance.

Winners of the Sir Percival David Volley Ball Tournament, 1944—The Dawn Mills Sports Club.

Seated (left to right):—Mr. L. H. Lawford, the Managing Director of the Dawn Mills and Mr. H. Hargreaves, the Manager of the Dawn Mills.

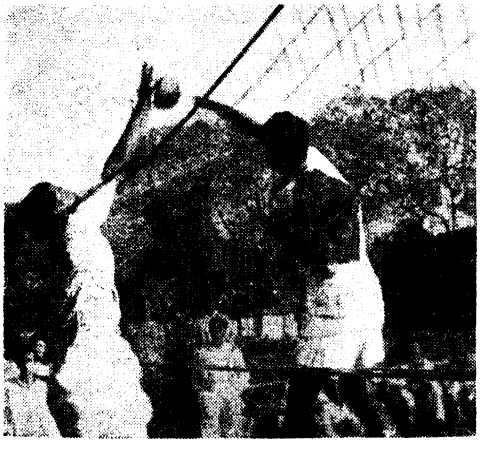
Standing (left to right):—Messrs. K. S. Gill, R. P. Gour, Y. S. Pawar, Keshodeo, Dwarkadas, B. S. Gill (Captain).

Another interesting event was the tug-of-war final between the carding and doubling departments of the mill. Both teams were equally strong and well matched. With grim determination and after a hard struggle, the carding department finally emerged victorious.

The Hon. Secretary of the club, Mr. B. S. Gill, read the annual report, giving a brief description of the various activities of the sports club during the past year.

In giving away the prizes, Mrs. Lawford congratulated and shook hands with each prize-winner. The prizes consisted of shields, cups, medals and even cash prizes, which were attractively displayed on a table in front of the president. Prizes were awarded for carrom (singles and doubles), volley ball, tug-of-war, 100 yards, ½ mile, high jump, long jump and putting the shot. A. Sattar, who secured the highest number of points, was the individual champion and was awarded a special prize.

The rival Captains—left: Mr. B. S. Gill (Dawn Mills) and Mr. Shinde (Government Welfare Centre).



Mr. Dwarkadas (left), a champion smasher from Rajputana supposed to be the best smasher in Bombay to-day in action.

A view of the final Volley Ball match in progress.

After the prizes were distributed, the president, Mr. L. H. Lawford, in a short but humorous speech, expressed his joy and pleasure at having been present on the occasion. He congratulated the prize-winners and wondered whether with his weight he would not have been useful in assisting one of the tug-of-war teams which took part in the final match that evening.

Mr. Lawford was very pleased that the mill was doing so much for its workers in the line of sports, and he hoped that the sports club would develop and flourish as it had done so far with the encouragement of the mill manager, Mr. H. Hargreaves, and through its Hon. Secretary, Mr. B. S. Gill.

He exhorted all the workers to help the war effort by striving hard to increase the production of the mill and promised to write to Sir Percival David, the proprietor of the mill, who was in South Africa at the time, giving him a full description of the evening's function as, he said, Sir Percival was very interested in the affairs of the mill and would undoubtedly be pleased to learn of that successful and enjoyable function.

The Labour Officer, Mr. D. D. Mistry, in proposing a vote of thanks to the chair, referred to Mr. Lawford's genial personality and sporting spirit.

Mr. L. H. Lawford, the president, and Mrs. Lawford, Mr. H. Hargreaves, the mill manager, and Mrs. Hargreaves, were then garlanded, and the function ended with "God Save The King."

Century Spinning and Manufacturing Co., Ltd. Bombay

Welfare Activities in 1944

THE following are extracts from the tenth annual report of the welfare department, Century Mills, Bombay, for the year ending 31st December 1944:—

The activities of the welfare department can be conveniently dealt with under the following heads:—(1) The Employees' Co-operative Credit Society, (2) Education, (3) Entertainment and recreation, (4) Scouts and blue birds, (5) Safety first (instruction and propaganda), (6) Grain Shop, (7) Canteens, (8) Medical, (9) Baby creché, (10) Scripture classes, (11) Sanitation and (12) General.

The Employees' Co-operative Credit Society

The year under report opened with 823 members on the roll. The number of members at present is 1,215, which shows a net rise of 392.

Composition of old debts.—Twenty cases of redemption of old debts were settled by the Welfare Officer for the borrowing members. In most cases creditors were successfully persuaded to reduce their claims in consideration of the interest they had already received from the debtors.

Education

The department conducted night classes for adults in Marathi, Telugu and Hindi. They were examined on the 1st and 2nd February 1944, the examinations being conducted by the Adult Literacy Committee. Certificates were awarded to the successful students.

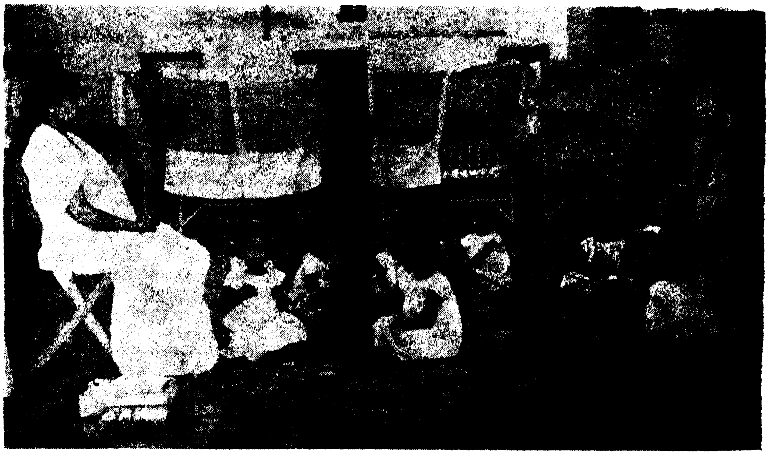
Library and Reading Room.—On account of popularity of the welfare library among mill staff, post-literacy students, scouts, retail cloth shop staff and chawl inmates, books worth about Rs. 500 in Marathi, Gujarati, Hindi and Telugu were added to the library. The use of the library has increased considerably.

Women's Club.—It has 28 women on its roll and attendance is about 16 on the average. The members meet once a week on Friday in the welfare centre. They are instructed in sewing, songs, rangoli, games, reading and writing. Blouses prepared by them were presented to them.

Nursery Class.—This class for infant and little girls from the chawls is in charge of two lady instructors who give them a general training in home crafts like sewing, knitting, cutting, etc., and in the three R's, physical exercises, domestic hygiene and cleanliness. The aim is to help the young ones to form habits of clean and decent living and be useful in their homes.

Entertainment and Recreation

Garden.—Facilities for games and sports of different kinds are provided in a recreation garden in the welfare centre where children of the workmen come to play in the evening.



Baby Creche: Montessori Training Class

Radio.—The radio installed in the welfare centre renders useful service in giving news. The automatic gramophone arrangement also gave useful service in training blue birds and scout boys in advance course of dancing, action songs and drill.

Akhada.—Bhaiyas, Mahars and Marathas gather in the morning and in the evening and have daily physical exercises and wrestling in the *akhada* in the welfare centre.

Three competitors were sent to the inter-mill wrestling tournament held by the Millowners' Association. They got cash prizes, even though none was successful in the finals.

Cricket.—The cricket club of the mills was started in December 1943. About 53 players have joined. The company has given full facility for store and spacious playground. During the course of the year 8 matches were played, out of which the club won 7 matches. Due to shift system of holidays more matches could not be arranged. Mr. T. G. Gadre acted as the Chairman of the club.

Safety First (Instruction and Propaganda)

Twelve meetings of the Safety First Committee were held during the year when 38 accidents which occurred in the mills during this period were reviewed. There were 24 major accidents during the day shift and 14 in the night shift as compared with 38 during the day and 19 in the night shift last year.

Medical

The medical department of the mills continued to function well during the year under report.

The total number of patients treated during the year was 61,658 as compared to 58,851 last year. The mill medical officer paid free visits to the chawl patients who were unable to attend the dispensary. Workers are taking full advantage of the following:—Ultra-violet rays and infra-red rays, spectacles for defective vision, free use of hot water bottle, ice bag, bed pan, urine pots, feeding cups, mackintosh and thermometers, free supply of milk and sweet limes to weak and sick children, and milk to expectant women and mothers.

Creche.—The créche continued to become more popular and proved its utility. This year young children were trained by the health visitor by holding a Montessori class in the creche. She held a class of mothers in the creche and advised them to avoid bad habits such as giving opium, etc., and gave them instructions on sewing, stitching and embroidery. The health visitor with the aid of ayahs took a keen interest in the health and well-being of children and their mothers. The children are given free milk, clothes, toys and picture books.

New Strain of Mulberry Tree in America Helps Development of Sericulture

A UNITED States research specialist in sericulture has developed a new strain of mulberry tree which he believes will contribute to culture of silk in the other Americas.

The specialist is Dr. Vartan K. Osigian, who returned recently to Washington from Venezuela, where some 2,500,000 trees of the new strain which bears his name—*Morera Osigian*—are growing on seven plantations. Silk-worms feed on mulberry leaves.

A citizen of the United States, Dr. Osigian was born in Armenia, and is the seventh generation of his family to carry on research in silk. He has been interested in developing sericulture in the Western Hemisphere for nearly 20 years. He has been working in the Estacion Sericola El Pinar, at Caracas.

He expressed the opinion in Washington that conditions for growing silk in Latin America are favourable.

According to Dr. Osigian, the mulberry tree he has developed produces a crop of leaves in six months—leaves which he says are more tender, have more sap, and are six to eight times as large as the usual leaf.

Dr. Osigian explained that the silk-worm has five senses and is discriminating in its choice of food. The baby larvæ prefer chopped leaves. Dr. Osigian said a silk-worm placed on the usual leaf will go to one from the new type of tree placed nearby.

Dr. Osigian claims that the silk-worms feeding on the new type of mulberry tree form cocoons larger than usual, producing about 3,000 yards of silk filament instead of the 1,000 to 1,500 yards usually produced.

Dr. Osigian also is responsible for the discovery, in 1915, of a process for producing coloured silk.

Eggs of a silk-worm which has spun scarlet silk, Dr. Osigian says, will produce more silk-worms which spin scarlet thread. One spinning a golden-yellow filament will produce another generation of yellow-thread spinners.

Besides Venezuela, many other hemisphere countries have begun silk production or experiments in sericulture. In Brazil raw-silk production has reached 500,000 pounds a year.—*Foreign Commerce Weekly.*

Commercial and Technical Organizations

Indian Merchants' Chamber, Bombay

Annual General Meeting:—The following are extracts from the speech of Mr. M. A. Master, President, delivered at the thirty-seventh general meeting of the Chamber, held on Wednesday, the 31st January 1945:—

Taxation Policy Needs Revision

" Sir Ardeshir Dalal does not seem to share fully the view of the commercial community that the existing policy of taxation does not enable industries to accumulate such reserves as would assist them in meeting the cost of re-equipment, rehabilitation and future expansion. The authors of the Bombay Plan in their Second Report have, however, remarked that in any scheme of future taxation that may be evolved 'it is necessary to emphasize that adequate remission should be granted in respect of the depreciation of the assets employed in production and that incomes ploughed back for increasing industrial or agricultural production should also be granted similar remission.' Satisfactory as this suggestion is, it is necessary to emphasize that the policy of taxing industries on the present scale does not leave with them the reserves which are badly needed both for re-equipment as well as for expansion. One may legitimately ask how the industries should finance their programme in the future for this purpose. For instance, if a spindle cost a mill Rs. 50 and a loom Rs. 800 before the war, and if the same spindle were to cost that mill Rs. 200 and a loom Rs. 2,500 during the coming years, can it be said that the policy of taxation has allowed the textile industry to accumulate such reserves as would enable them to finance their programme of rehabilitation and reconstruction? One should not expect that such programme should be financed by further borrowings. That is bound to affect the economic structure and the financial strength of the existing industries. It should not be forgotten that industries in other countries have financed their programme of expansion out of the profits that they have already made. Unless, therefore, the existing policy of taxing industries is so revised as to enable them to provide adequate depreciation, calculated on the basis of replacement, and would place them in a position to build up sufficient reserves after the payment of taxes for their future expansion, not only will the existing industries find it difficult to maintain their financial stability but it will also make it almost impossible for future industries even to withstand foreign competition in spite of protection. I would, therefore, most earnestly appeal to Sir Ardeshir Dalal, who has vast experience in these matters, to urge upon the Government of India to evolve such a policy of taxing industries in the future as will enable both the existing and the future industries to grow and expand out of the profits that might be made by them under the policy of protection, when necessary, in the true interests of this country."

All-India Organization of Industrial Employers, Bombay

The following are extracts from the presidential speech of the Hon. Sir Rahimtoola M. Chinoy at the twelfth annual session held towards the end of January 1945:—

" During the current year, the war situation has completely changed, and the final victory over the enemy is now within sight. The war situation, as it has improved in the West, had led the Western countries, particularly the United Kingdom and the United States of America, to devote many months back their attention to the problems of making a beginning in the changing over from war economy to peace economy. In the U.S.A. many factories and industrial centres were released from obligation to manufacture for war purposes. Many more would have been released but for the temporary delay in the advance of the Allied armies in the Western Front. The fact that with the defeat of Germany the process of reconversion would immediately take place, as is evident from the recent Lease-Lend Agreement between the United Kingdom and the United States of America, should naturally lead us in this country to concentrate our efforts towards taking initial steps in switching over our war economy to peace-time needs. I very much apprehend that, while the United Kingdom and the United States would have already started manufacturing on a large scale for civilian and even export markets, we in India might continue to be handicapped on account of the Government of India being compelled to continue the rigour of war-time controls and justify the same as long as war with Japan continues, with India as the base of operations. As a result, Indian industry would not be enabled to meet India's own civilian demand, while foreign producers will commence exporting their goods to this country. Civilian demand—starved as it has been during the war because Indian industry was not allowed to increase production of civilian goods, and accumulated as it has—would be met by foreign producers, while Indian industry will remain in the strait jacket of rigid war-time controls and regulations. This will make it extremely difficult for Indian manufacturers to resume full contacts in their own market. It will indeed be a tragedy if the Government of India fail to realize sufficiently early that transition from war to peace in India should be timed with that in other countries.

Reconversion Problems

" While it is true that the post-war reconstruction plans for India, whether envisaged by the industrialists or by Government, or even by other economists and public men, would include a measure of Government control and regulation, there is great deal of misconception in regard to the nature and the necessity of controls. In the U.K., and particularly in the U.S.A., although planning for post-war reconstruction is accepted to be essential, the maintenance of private enterprise—free, uncontrolled and fully competitive—is being cherished. This is a legitimate reaction of the industrial and business community against war-time restrictions which they have accepted as necessary for mobilizing the resources of the country for a total war. We in this country have also been subjected to controls and restrictions which, though justifiable on account of war needs, cannot be said to be so devised, or even so administered, as to leave adequate scope to the industrialist for maintaining higher production, be it for war purposes or be it for essential civilian needs. Therefore, the first step—and this step should be taken as soon as possible—is to revise and rationalize all the controls over industry and trade, so as to help the process of reconversion which should be taken up without delay. I am afraid that the problems of reconversion are not fully appreciated in this country, at least not so fully as are the problems of reconstruction. It must be realized that reconversion should be planned in the same manner as the post-war reconstruction is being planned in this country. The first step towards reconversion is to allow the industry to switch-over to civilian production and thereby restore the existing industries in the country in their normal setting of overall industrial expansion. Controls hitherto have been restrictive. Controls should now be revised so as to help expansion. Unless this is done, I am afraid, our post-war planning would suffer for want of faith in the utility and benefits of controls. I am fully aware that the post-war planning, as it is envisaged in this country, would require a degree of Government regulation and control. Industries, such as munitions and armaments, might be entirely owned and managed by the State. Ownership and management of other industries, which are essential in the national interest but for which private capital may not be forthcoming, might also rest with Government. Government may further take over the ownership and control of certain large-scale industries of great national importance, which are beyond the resources of individual capitalists, and the industries which are likely to become monopolistic may also be run by the State. In spite of all this, it is evident that private enterprise will have an expanding sphere of operation. It may, in all wisdom, be proper to control the free play of private enterprise and initiative, at least in the primary stage of the post-war policy of our Government, but once the specific purpose is served, the basic requirements of continuing the system of private enterprise would be more fully appreciated. Of course, it is understood that whatever may be the degree of Government control, regulation, or even ownership and management of industries in the country, the Government should be a fully national one. No Government which falls short of our conception of a National Government can be vested with extraordinary powers affecting our industries. India, at the moment, is far behind the stage and the question is not whether the State control is absolutely necessary, but that, because the State does not belong to the citizens, the control would merely be the British control. The need for such a National Government is all the greater during the transition period, because it would entail sacrifices which a National Government alone could call upon the people to bear.

Future of Controls

" Controls hitherto have had only one objective, that is, to feed the war needs. Controls, during the reconversion phase, should simultaneously have another vital objective, namely, that of allowing industry to take up production for civilian market. Scarcity of essential materials, such as coal, raw materials, mechanical equipment, machinery, machine-tools, etc., should be forthwith met through local production; and if local production is incapable of meeting the same, imports should be immediately provided for. In regard to coal, I would like to mention that, instead of supplying the needs of the domestic industries, Indian coal of high grade quality is still being used for bunkering purposes of the British naval and merchant fleets at the Indian ports. I would earnestly urge upon the Government to prevail upon the United Nations, particularly the United Kingdom, to meet their increasing requirements of bunkering coal from sources other than Indian coal. In any case, this demand should not be met at the cost of industrial production in the country which has already suffered on account of several factories being compelled to close for want of coal supplies.

" Once the competitive conditions begin to emerge, the Indian industrialists will have to look into their cost of production if they are to face the competition, particularly with the foreign countries which have already taken steps in this direction. I would particularly urge upon the textile industry to study the problems of rationalization and take steps to achieve this. In the process of rationalization, we may find that our industrial equipment, which has been worn out almost completely during the last five years of war, would need to be replaced. Capital shall have to be found for such a replacement. We shall have to approach capital goods manufacturing countries for finding the replacement machinery. Foreign exchange will have to be found for that purpose. New technological developments, particularly those that have taken place in America, shall have to be taken into account.

Taxation

" If industries in India are continued to be burdened with the war-time taxation which has left very inadequate and lean depreciation and reserve funds in the hands of the industries, I am afraid that Indian industries would neither be able to achieve any rationalization nor compete on equal terms with the foreign producers. In this background the principle that war-scale of taxation should be continued for the sake of post-war reconstruction, as was indicated by His Excellency the Viceroy in his address to the Associated Chambers of Commerce, would not be acceptable to the country which has borne a burden of war cost far beyond its capacity—a cost over which the Indian public had neither any say nor any control. It must, therefore, be made clear that the very foundations of reconversion, as also of our post-war reconstruction, would be sabotaged if industrial expansion is hampered by high taxation which only the emergency of war has so far justified. The present level of taxation on industry is acknowledged by all authorities to be more burdensome than the Indian industries can bear. The present level of taxation needs revision, particularly in respect of granting larger allowances for depreciation and replacement funds. In making a plea for granting taxation relief to the industry adequate to the needs of reconversion and rationalization, I am fully conscious of the fact that our post-war reconstruction plans would demand sacrifice from the people, as also from the industry. The financing of our post-war plans would need huge funds, but these funds need not be provided from taxation only. Furthermore, even if higher taxation may be needed, the sources of taxation need not be the same as were exploited during the war. In fact, for our post-war reconstruction purposes, the whole of our taxation system shall have to be revised and rationalized. It must be elastic and it must help economic expansion. As the economic expansion takes place, the sources of revenue will be more varied and each source will yield larger revenue than what it used to yield before the war.

Exports

"I would recommend to the manufacturers and exporters to form export associations, the functions of which would be to study the requirements of our customers and to see that the standard and quality of our goods—whether raw materials or manufactured goods—are well-maintained. Such associations should be enabled to certify the quality and standard of goods. Simultaneously, the Government should see that our customer countries are well provided with able and energetic Trade Commissioners who should be drawn preferably from business. The principle that Trade Commissioners' Organizations should be equipped with able personnel having commercial experience and knowledge, has been recognized by the United Kingdom and the U.S.A. India has suffered for want of adequate facilities, and particularly for want of able personnel in our Trade Commissioners' Organizations.

Labour Welfare

"The essential requisite for implementing plans of labour welfare and social security is to make sure that industry is made capable of bearing the burden which would be involved thereby. Indian employers have sympathized with the measures contemplated by Government in respect of holidays with pay, or in respect of sickness insurance and social security. In fact, many employers have been voluntarily giving benefits and facilities to labour in these matters. We have unequivocally expressed our view that we are willing to bear our share of the burden of sickness insurance, as soon as a satisfactory scheme providing for an equitable distribution of the burden between the State, the employers and the workers has been evolved."

Textile Stores and Machinery Merchants' Association, Bombay

Third Quarterly Meeting.—The following are extracts from the speech of the President, Mr. R. M. Nanavati, at the third quarterly general meeting held on 5th January, 1945:—

"We can have one great relief in the statement made by H.E. the Viceroy that India's sterling debt will be honoured and upon discussion and negotiation, we can have payments in instalments, which will enable us to buy our requirements of capital goods from U.K. Manufacturers in U.K. and U.S.A. are quite ready to book orders for machinery. It will be second-hand, of course, in the sense it has been used, but it will be in first class condition and will represent the latest in scientific development. A special officer is being appointed in the Indian Department of Commerce in Washington to facilitate the importation of heavy machinery and capital goods for India's post-war development. However, British goods are supposed to be much cheaper than American, and if Indian business men will further delay in booking orders, the British industrialists who are conscious of the fact that America is attracting Indian attention, will send a British Manufacturers' Mission to India to establish trade contacts with Indian industrialists. They have not done so hitherto, because since about six months, the delegation of Indian industrialists are preparing to proceed to U.K. and U.S.A. During this war, the British and Americans have expanded their industries and after the war they will continue to enhance their production for securing employment. In order to liquidate the debts incurred in this war, they will also make substantial increases in exports. They expect that India's huge surplus sterling balance should be considered as having been paid over to them in exchange for their capital and consumer goods which may be delivered to us in future as and when convenient to them and at prices as may be charged by them."

Priority for movement of Millstores, Dyes and Chemicals.—A circular was issued by the Textile Commissioner on 20th July 1944 revising the previous list of stores exempted from the necessity of obtaining priority certificates for transport to textile mills by rail.

(*a*) The Association drew the attention of the Textile Commissioner to the fact that in the above circular, facilities to transport goods were given only in such cases where the goods were consigned to textile mills and the same facilities were not permitted when goods were consigned to handloom weavers. They requested the Textile Commissioner to extend the same facility to the handloom weavers who were mostly uneducated and further requested him to permit recognized and established suppliers to forward goods to handloom weavers without priority assistance.

The Textile Commissioner informed the Association that their suggestion could not be accepted due to administrative difficulties. He assured them that no genuine case of transport of millstores was refused and every care was taken to see that facilities for transport were provided. The restrictions had to be imposed as the facilities given in the past were abused. He further suggested that if any merchant experienced genuine difficulties in getting his consignment moved to handloom weavers or to any other genuine dealer in any part of India, they should kindly inform such parties to contact the Textile Commissioner's office when necessary steps would be taken to assist them.

(*b*) *Facilities for transport of tapioca powder.*—The Association requested the Textile Commissioner to grant facilities for the transport of tapioca powder from production centres in the south to Bombay and up-country mills. As movement of tapioca powder without priority was possible, the Textile Commissioner informed them that it was not necessary to grant special assistance in the matter. The production centres are given facilities to rail tapioca powder to Cochin from where the consignments are shipped to ports.

They also addressed the Textile Commissioner requesting him to extend the same facilities as were granted for the transport of 13 items of millstores, etc., to the following articles of millstores which were equally essential for textile mills and factories.

(i) Healds and Reeds, (ii) machinery cloth, (iii) leather belting, roller skins and picking bands, (iv) ropes, tapes and bandings.

The Textile Commissioner informed them that the items mentioned above could not be included in grade " A " and, therefore, applications on form " A " would have to be submitted to his office when necessary action would be taken.

Andhra Chamber of Commerce, Ltd., Madras

Conference of its Affiliated Bodies, etc.—Under the auspices of the Andhra Chamber of Commerce, a conference of its affiliated and other Andhra commercial bodies, etc., was held on the 29th, 30th and 31st December, 1944. Mr. S. V. Ramamurthy, I.C.S., Adviser to H.E. the Governor of Madras, opened the conference, and Mr. C. Seshachalam, M.A., B.L., President of the Chamber, presided. Several important subjects relating to controls, food problem, transport, taxation, post-war reconstruction, etc., were discussed at the conference.

The following resolutions, among others regarding the textile control orders, were passed at the conference:

" This conference resolves that, while the time limit of six months for the opening of the bales be retained, the time limit for the disposal of the goods by retailers be abandoned."

" This conference is of opinion that monopoly or invitee system deprives several merchants of their legitimate function in the trade in piecegoods and recommends to the Provincial Textile Commissioner to distribute the fixed quota goods to as many merchants as possible who are the real quota holders and thereby maintain a uniform policy of distribution."

" This conference is of opinion that a net per centage of twenty must be allowed by way of profits as the same is to be divided between three merchants and the provincial sales tax be over and above the fixed 20 per cent."

" This conference recommends to the All-India Commissioner through the Provincial Textile Commissioner to induce mills to manufacture only such varieties of cloth as are needed and not to manufacture unwanted cloth and thereby make the retailers suffer, as they cannot force the consumers to accept their choice."

" This conference requests the Provincial Textile Commissioner to enforce a scheme to ensure sufficient bales of grey and bleached longcloths, mulls, *khadis*, etc., to the colour cloth manufacturers in all the important centres for hand-printing and dyeing purposes from the quota holders all-round the province."

" This conference is of the opinion that the disparities in ceiling prices of certain qualities and especially in printed goods popularly known as 'Karkhana chints' are very apparent and the textile authorities have not taken any pains to eradicate this and hence this conference urges the Provincial Textile Commissioner to investigate the matter thoroughly and get it rectified as early as possible."

" This conference requests the Provincial Textile Commissioner to constitute District Committees comprising merchants, consumers and officials to advise the Government on all important matters regarding textile control orders including launching of prosecutions."

Bengal Millowners' Association, Calcutta

Second Quarterly Meeting.—The following are extracts from the presidential speech of Mr. R. N. Dutt at the second quarterly general meeting of the Association held last month:—

The joint efforts of Government and the textile industry in bringing down the cloth prices, have, I am happy to say, been crowned with a large measure of success. I would refer to the action of the Government of Bengal in bringing the quota system into operation with effect from November 1944. The Provincial Government deserves to be congratulated for this wise course of action, thereby helping to maintain normal channels of trade. I may point out that I impressed on the Hon'ble Minister for Civil Supplies during my recent interviews the necessity of maintaining normal trade channels and of fixing quotas between dealers and dealers. I hope that the Provincial Government would also release the finer counts through normal trade channels in the usual course.

"It will be recalled that during the recent visit of the Textile Commissioner to Calcutta and the discussions which your committee had with him, it was pointed out that the quota allocated to the Bengal area was insufficient to meet the full requirements of the province. The Textile Commissioner had then informed the Committee that the Government of India had fixed provincial quotas on a basis of 12 yards of cloth per head. Your Committee impressed on him the acute shortage in Bengal due to various factors such as the diversion of appreciable quantities of cloth for the manufacture of ready-made garments for the military and auxiliary personnel and to meet the requirements of Red Cross and other hospitals. The Committee also drew the attention of the Textile Commissioner to the exports of cloth from Bengal to certain countries like China. I have now learnt with great disappointment that the Textile Commissioner has arrived at some tentative pre-war consumption figures of cloth in the various provinces according to which Bengal has been allocated cloth on the basis of 10.45 yards per head. I am not aware as to the basis on which these consumption figures of cloth have been calculated. I may point out that the production of handloom cloth was a very big factor which supplemented the cloth consumption in normal times. It is estimated that fall in handloom production has been 30 per cent. below normal due to difficulties in getting yarn supply. In any case, the increase of military and auxiliary forces in Bengal have vastly added to the requirements of the civil population. Allocation of cloth to Bengal on the basis of 12 yards per head of the population is, as it is, quite insufficient to meet the requirements of the province.

As regards the urgent and varied problems that will face the Indian textile industry during the post-war period, I do not think it is necessary for me to prove the necessity for the announcement of a definite and positive policy by Government with regard to the post-war reconstruction of the Industry. One of the most pressing problems of the textile industry in the immediate post-war period would be the modernization and replacement of worn-out machinery. It is only if the Government of India come forward with active help in securing priorities by agreement with the the respective Governments that our industry can expect to replace a substantial part of their machinery requirements. Apart from this the Government of India's help is needed in enabling the cotton mills to accumulate adequate reserves for post-war replacements of machinery when much higher prices will have to be paid. This would involve depreciation allowance on a more generous scale than has hitherto been done. In this connection I consider that the scheme submitted by the Bombay Millowners' Association suggesting to the Government the grant of depreciation allowance at the rate of 10 per cent. for single shift, 20 per cent. for double shift and 25 per cent. for three shifts is quite reasonable. Moreover, I appeal to Government to earmark a higher portion of the E.P.T. profits for the post-war reconstruction of the industry. This is necessary in view of the special difficulties with which the industry is bound to be faced in the post-war period."

Karachi Chamber of Commerce, Karachi

Distribution of Cloth.—The Chamber has represented to the Textile Commissioner, Bombay, that the quota for Sind should be increased from 12 yards to at least 18 yards per head, which was understood to be the level of the allotment to Bombay and the Punjab. The Chamber submitted that 12 yards per head was definitely much below the normal consumption in Sind, and that 18 yards was the minimum necessary to meet actual requirements to adequately clothe the population. Further, there appeared to be no justifications for Sind receiving less than Bombay or the Punjab.

Upper India Chamber of Commerce, Cawnpore

Excess Profits Tax: Post-War Taxation on Profits of Industry.—The Associated Chambers of Commerce of India passed the following resolutions at the annual general meeting held in December last:

"This Association urges the Government of India to give an assurance to industry that, on the termination of excess profits tax, all revenue expenses incurred or accrued in earning these excess profits but not already included as a charge because of their indeterminate nature will be allowed as a deduction in computing the final liability to excess profits tax and that refunds of such tax in adjustment thereof will be made should the tax have been removed."

Constituent chambers have been informed that the following reply had been received from the Government of India:—

"In moving the resolution Mr. Younie asked for an assurance such as that given in the House of Commons by the Chancellor of the Exchequer, viz., that steps will be taken to see that all expenses of a revenue nature which have been incurred in earning the excess profits will be allowed as a deduction in computing the liability to excess profits tax. I am directed to say that the Government of India give such an assurance but that they are not prepared at this stage to commit themselves to any detailed proposals for giving effect to the assurance."

All-India Handloom Board.—Towards the end of May, the Director of Industries, United Provinces, invited the views of the Chamber on the subject of the setting up of an All-India Handloom Board.

The Director of Industries was informed that the proposed All-India Handloom Board could, undoubtedly, do very useful work on behalf of the handloom industry. It was, however, envisaged that an unwieldy Board of the description indicated in the Government of India's letter would not be able to give the industry the direct help it required (particularly in the varied and widely separated handloom districts), and also that the problem was one which could, to better advantage, be handled by Provincial Governments. It was accordingly suggested that, if an all-India Board was constituted, local Boards should also be formed in the various Provinces and States. It was thought that the latter would ensure closer contact with the local handloom industry and would be able better to appreciate their peculiar difficulties and report thereon to the all-India Board.

Association of Indian Importers of Dyestuffs, Bombay

Annual General Meeting.—The third annual general meeting of the Association was held on Saturday the 27th January, 1945. Mr. Khatau Valabhdas, President, presided. In a suitable speech, the President moved the adoption of the annual report and accounts for the year 1944. The Vice-President, Mr. K. H. Kabbur, seconded the motion, which was carried unanimously.

After some general discussion, the following persons were elected office-bearers for the year 1945:—

President: Mr. K. H. Kabbur. *Vice-President:* Mr. R. J. Mistry. *Members of the Committee:* Messrs. Khatau Valabhdas, S. Sheth, J. H Doshi and Chotalal Marfatia.

TRADE LETTERS

(From Our Special Correspondents)

Ahmedabad

AHMEDABAD cloth merchants who have adopted the quota system on the lines of the Government quota system have been merrily carrying on their trade while Bombay cloth merchants have been ousted by Government. Government, too, appears to be quite satisfied with the working of the quota system of the Ahmedabad cloth merchants who have secured the approval of the Textile Commissioner. While Bombay goods move slowly to the deficit zones owing to the interruption of the trade channel, Ahmedabad goods move quickly to the deficit zones through the usual trade channel. A complaint has been made by the Government agents of deficit zones of non-receipt of goods from Ahmedabad merchants, who state that as their goods have not been frozen by Government they are not bound to give goods to Government agents who are not their quota holders. As time passes, Ahmedabad merchants are perfecting their system of distribution. They have employed a special staff to supervise the working of their system, and if any breaches are detected, they are heavily fined. The association of the wholesale merchants known as the Maskati Cloth Market Association has frozen the stocks of all its members and distributes them to their quota-holders by varieties. There is thus no loophole left to individual merchants for black marketing.

Government is said to be devising a new scheme of distribution of cloth whereby surplus and deficit areas will be placed on the same level of 18 yards per head. Surplus areas will feel the same pinch as the deficit areas. To mitigate the hardships of both the areas Government is said to be contemplating a scheme to encourage spinning of yarn both by hand and machinery for handloom weavers. What China has done India can do if the people have the will to produce cloth by plying handlooms and spinning wheels which do not require any great skill or implements which cannot be available. If hand-spinning cannot yield sufficient yarn, Government is prepared to give facilities for importing spinning machinery and erecting spinning mills. India will have to clothe the world for some time, and she should utilize the opportunity fully to produce more cloth.

Textile Labour Association

While the need for greater production is felt more than ever before, the Textile Labour Association has threatened the local textile industry with a general strike if its demands for bonus, compensation for stoppages due to coal shortage and special facilities for night-shift workers are not settled through conciliation or arbitration. We don't think Government will allow a general strike in the midst of a war, and may persuade the Ahmedabad Millowners' Association to accept the arbitration of the Industrial Court as it did on the outbreak of war on the question of dearness allowance. Ahmedabad workers who have been getting the highest dearness allowance and basic wage in India, will succeed in extorting a few more concessions during the war, but after the war is over, they will have to face a cut which the millowners were persistently trying to effect before the war. They did not succeed as far as their brother millowners in Bombay and other places did, as they were confronted with a system of arbitration evolved by Mahatma Gandhi. They scrapped this system of arbitration as soon as the Industrial Disputes Act was passed with its provision for voluntary arbitration of the Industrial Court. They have accepted the latter during the war, but after the war they will not accept it unless it is made compulsory by Act like conciliation.

The Labour Association is preparing the workers for a grim struggle with capital if it is precipitated. It is drawing within its fold all the workers who have not joined it. Its membership has reached 65,000 out of the total number of 130,000 workers. It tried to collect their savings by a scheme of compulsory savings, but the Millowners' Association refused to accept it. Now it has approached Government to sanction its scheme of savings and has opened a co-operative bank for the purpose. Better organized and financially better-off Ahmedabad workers will offer a tougher fight to their employers after the war than before the war if they are forced to it. But if they are properly trained and housed, they will be an asset to the industry which will be better able to stand post-war depression. Nobody, however, thinks of training and housing labour for the good of the industry. When the post-war depression starts, efficiency of labour will help the industry, not a struggle between capital and labour, which will rudely shake the industry. In spite of the highest wage-bill which it has been paying, the Ahmedabad industry has progressed and will continue to progress if labour is efficient. The continuous flow of labour to Ahmedabad industry is maintained by the high wages which it gets in spite of the housing and other difficulties. Any attempt to cut wages will, besides precipitating a struggle with labour, interrupt the flow of labour to Ahmedabad industry which will experience shortage of labour. Abundant supply of labour is essential for raising the efficiency of labour to a high level. It is advisable for the Millowners' Association and the Labour Association to collaborate in a scheme for the efficiency of workers on which the post-war fate of the industry depends.

South India

Textile Control in 1943-44 in Madras

ONE of the most important duties which the Madras Textile Control Department undertook during 1943-44 was in connection with the administration of the Cotton Cloth and Yarn (Control) Order, 1943, promulgated by the Central Government in June 1943. Adequate arrangements were made in the province to enforce strictly the provisions of this Order, especially the anti-hoarding and price control provisions. The province had already built up an efficient licensing system, prior to the promulgation of the Cotton Cloth and Yarn (Cortrol) Order, 1943, by the Central Government.

Under an agreement with the millowners yarn required for the Government collective weaving centres and weavers' co-operative societies was supplied by the mills regularly at panel prices. With a view to safeguarding adequate supplies of yarn to handloom weavers outside these approved organizations, the Madras Government promulgated in March 1943 an important order prohibiting the export of yarn from the Province except under permits issued by the Provincial Textile Commissioner, Madras.

The collective weaving centres and Madras Handloom Weavers' Provincial Co-operative Society, Limited, Madras, produced and supplied for war purposes large quantities of towels, handkerchiefs, bandage, bunting and gauze cloths, dusters, etc.

The Government Textile Institute, Madras, was reorganized so that it might contribute the maximum practical assistance to the handloom industry. A gazetted officer, designated as "Tinctorial Chemist," was appointed for research on the extraction, standardization and use of vegetable dyes. This officer collected information regarding dye materials which are readily available in large quantities and conducted preliminary experiments on the nature of some materials so collected with reference to fast dyes, mainly for cotton. The experiments so far carried out indicate that gun kino and cashew shell liquid can be satisfactorily used for dyeing, especially for printing cotton cloth or yarn. The shades that could be obtained from the former are grey, brown, yellow, deep violet and red; and from the latter, violet, orange and red.

The quantity of mill-made standard cloth allotted to the province during May 1943 to July 1944 was 863 lakhs of yards. The sales upto the end of March 1944 were 291 lakhs of yards.

Collective weaving centres were originally organized to produce war textiles. Work in these centres was directed to meet civilian requirements. There were at the end of the year 13 centres in Salem, Ramnad, Bellary, Tinnevelly, Cuddapah, Kurnool, Guntur, Chitoor, East Godavari and Tanjore Districts. The number of looms in these centres rose from 1,420 to 6,178 towards the end of August 1943 and fell to 1,783 at the end of the year. All the centres worked at a profit.

Two schemes, one at Dharmavaram and the other at Cannanore, were worked for some time during the year through master weavers for the production of cloth to meet civilian requirements.

Export of Cloth for War Purposes

The Provincial Textile Commissioner in Madras has issued the following notification to the textile mills in the Province:—

"Under the first proviso to clause 3 of the Madras Cotton Cloth (Exports) Control Order, 1945, the Provincial Textile Commissioner, Madras, hereby authorizes the transport without a permit, by any textile mill in the province of Madras, of cloth manufactured by it for war purposes of which it is bound under clause 18A of the Cotton Cloth and Yarn (Control) Order, 1943, to deliver to its quota-holders at their place of business within the limits of the South Deficit Zone as specified in the General Permit notified by the Central Government for the purpose of the Cotton Cloth Movements Control Order, 1943.

"Any consignment of cloth transported by a textile mill under this general order shall be covered by a certificate in Form III in the Schedule to the aforesaid Control Order, duly signed by the agents or the manager of the mill.

"Under clause 9 of the Madras Cotton Cloth (Exports) Control Order, 1945, the Provincial Textile Commissioner hereby authorizes the officers specified below to exercise within their respective areas the powers of demanding information from and of giving instructions to holders of permits issued under the said Control Order."

Designation of Officer :—Area within which the powers may be exercised. (1) All Assistant Textile Commissioners—Throughout the Province. (2) Personal Assistant to the Provincial Textile Commissioner, Madras—Throughout the Province. (3) Textile Control Officers—Within the districts or portions of them over which they have jurisdiction. (4) Textile Assistant attached to the office of the Provincial Textile Commissioner, Madras. (5) Market Assistant attached to the office of the Provincial Textile Commissioner, Madras—Throughout the Province.

Food Crops on Land Intended for Mulberry

In connection with the cultivation of mulberry on waste lands in Kollegal taluk in Coimbatore district, the Government of Madras have made a concession to "the landless poor," that is, to ryots who are unable to take more than four acres for cultivation. This is *apropos* of the permanent assignment of 10,000 acres, in compact blocks of assessed and unassessed waste lands, in Kollegal taluk. The Government issued the assignment order in December 1943, in view of the importance of sericulture industry. The assignment order stipulated that ryots to whom a permanent assignment was made should grow only mulberry on those lands. Government have now relaxed the condition, so as to permit the "landless poor" to grow food crops to an extent not exceeding one acre out of the area assigned in each case for planting mulberry.

Export of Cloth from Madras Province Controlled

The Madras Government have promulgated the Madras Cloth (Exports) Control Order, 1945. It extends to the whole of the Province of Madras and came into force from 10th January 1945. The Order lays down that no person shall, on or after 10th January 1945 transport cloth from any place within the limits of the Province to any place in India outside the Province, except under a permit issued by the Provincial Textile Commissioner, Madras. It is, however, provided that the Commissioner may by general or special order, authorize such transport without a permit by any textile mill, of cloth manufactured by it for war purposes or which it is bound under clause 18A of the Cotton Cloth and Yarn Control Order of 1943, to deliver to its quota holders at their place of business within the limits of the South Deficit Zone.

Technological Education

The Madras Government have sanctioned a grant of Rs. 10 lakhs and a recurring annual grant of Rs. 2 lakhs to the Annamalai University for starting an Institute of Technology and a College of Engineering in the University. The College is expected to function from July next.

Cotton Production and Prices : Government Report

In a Press Note issued by the Madras Government on cotton production and prices the Department of Civil Supplies says that pickings of the Mungari or early sown crop are in progress and the yield is expected to be generally below the normal. Heavy and continuous rain in November 1944 are reported to have arrested the growth of the crop in the central districts and in the south. The plants are reported to be improving with the subsequent bright weather. The condition of the crop is generally satisfactory in the other districts of the Province.

The average wholesale price of cotton lint per imperial maund of 82 2/7 lbs. as reported from important markets on 6th January 1945, was Rs. 27-3 for Cocoanada, Rs. 19 for White Northerns, Rs. 24-11 for Red Northerns, Rs. 16-11 for Westerns (Mungari), Rs. 21-3 for Westerns (Hingari), Rs. 50-15 for Coimbatore (Cambodia), Rs. 44-15 for Coimbatore (Karunganni), Rs. 34-2 for Nadam cotton, Rs. 40-15 for Virudhunagar (Southern) Cambodia and Rs. 27-13 for Tinnevelly cotton. When compared with the prices on 9th December, dealt with in the last report, the prices reveal a rise of approximately 10 per cent. in the case of Cocoanadas, 25 per cent. in the case of Red Northerns, 2 per cent. in the case of Coimbatore Cambodia and 5 per cent. in the case of Coimbatore Karunganni and a fall of approximately 2 per cent. in the case of Westerns (Mungari) and (Hingari), the prices remaining stationary in the case of White Northerns and Nadam cotton.

Experiments on Diesel Oil Engines

The Government of Madras have issued the following Press Note:—"Experiments were carried out recently at the College of Engineering, Guindy, on running diesel oil engines with the combination of producer gas from charcoal and groundnut oil and that the investigation was far more important than the running of diesel oil engines on groundnut oil alone. The tests have been carried out and the following conclusions are drawn:—

The conversion of oil engines to run on suction gas should be confined to high speed diesel engines. The conversion depends upon the availability of gas producers. Until a reliable gas producer is developed for use with inferior fuels, charcoal gas producers manufactured in India for automobile engines are recommended for use with high speed diesel engines. The running of high speed diesel engines on charcoal gas with groundnut oil or high speed diesel oil is recommended in preference to running them on charcoal gas with magneto or coil and battery ignition. The running of high speed diesel engine in the above manner requires the provision of efficient and suitable type of carburettors. The carburettor should be connected to the pipe intake of the engine. Engines which do not have a pipe intake must be provided with a suitable fitting. Single-cylinder engine must be provided with an anti-pulsating device such as a 40-gallon drum introduced in the gas plant. Twin-cylinder and multi-cylinder engines do not require such a device. In order to ensure the highest percentage of fuel oil, the gas, air and oil control valves should be adjusted for each particular load in the adjustment of these valves, the important point to note is to give the engine maximum quantity of gas and minimum quantity of oil consistent with steady and smooth running of the engine. The highest percentage of groundnut oil savings in the 12.5 h.p. Lister high speed diesel engine when the gas, air and oil control valves were adjusted in the manner was 69 at 8.12 h.p. which was maintained up to 10.4 h.p. This figure can be improved if the engine is of a multi-cylinder type similar to an auto diesel engine. The conversion of high speed diesel engines to run on charcoal gas should be carried out by a reliable engineering firm, who have the technical personnel to design suitable carburettors and who have the experience and equipment for manufacturing gas producers in order to ensure the conversion to be a success.

All persons interested in the experiment who desire to get further details may get them from the Principal, College of Engineering, Guindy.

Raw Cotton Statistics

The receipts of loose cotton at presses and spinning mills in the Madras Province from 1st February 1944 to 12th January 1945 amounted to 497,323 bales of 400-lb. lint as against an estimate of 458,700 bales of the total crop of 1943-44. The receipts in the corresponding period of the previous year were 422,352 bales; 688,181 bales mainly of pressed cotton were received at spinning mills and 5,076 bales were exported by sea, while 230,430 bales were imported by sea mainly from Karachi and Bombay.

* * *

Egyptian Cotton Market

Second Crop Estimate

THE Ministry of Agriculture, Alexandria published, on 4th December, 1944, the following *second estimate of the* 1944-45 *cotton crop:*

	Unginned cotton		*Ginned cotton*	
	Total crop Cantars	Average yield per feddan Cantars	Total crop Cantars	Average yield per feddan Cantars
Long staple cotton— Longer than 1⅜" (Maarad, Malaki, Amon Karnak, Menufi, Giza 7) ..	3,203,000	4,63	3,349,000 (of which Giza 7	4,86 700,000 crs.)
Medium-Long staple cotton— Longer than 1¼" Other varieties	6,000	4,02	6,000	4,27
Medium-staple cotton— Longer than 1⅛". (Ashmuni)	932,000	5,86	1,034,000	6,51
Total ..	4,141,000	4,86	4,389,000	5,15
Scarto			94,000	
Total crop including Scarto..			4,483,000	

This second estimate differs only slightly from the first Government crop estimate published on 5th October, 1944, and corresponds closely with the recent estimate of the Commission de la Bourse de Minet-el-Bassal of 4,500,000 crs. excluding Scarto.

Exports

Exports from the beginning of the season (1-9-44) up to 18th December 1944, are recorded as follows:—

	From 1-9-1944 to 13-12-1944			As compared with last year during the same period (from 1-9-1943 to 15-12-1943)
	Bales		Cantars	Cantars
Sakel	3,381	=	24,483	42,846
Maarad	2,498	=	18,360	30,481
Giza 7	16,326	=	119,996	369,775
Karnak	44,212	=	324,958	371,217
Ashmuni	31,487	=	231,429	454,422
Zagora	3,254	=	23,917	263,923
Various	2,331	=	17,133	80,188
Malaki	....		....	27,103
Sakha 4	....		....	31,321
	103,489		760,276	1,671,276

Exports which proceeded at a very slow rate at the beginning of the season have suddenly improved and now reach 760,276 crs. The recent accelerated offtake has not been without a strengthening influence on the prices of the Alexandria spot market. If exports continue on the present scale, they should, together with the local consumption, easily absorb a quantity of cotton equal to the 1944-45 crop. It is, however, to be expected that exports, which during the first three and a half months of this season amounted only to 45 per cent. of last season's corresponding quantity, will be accelerated.

Planning for India's Needs

The Chemical Industry

THE chemical industry, entering as it does into the manufacture of almost all the materials required for human needs and comfort, plays a leading part in the development, industrial and other, of every nation. India's chemical industry is still in its infancy. It is true that five years of war have helped its expansion to a certain extent. But these favourable conditions will soon end, and then we shall have to face competition as never before. Our survival in that competition depends largely on the steps we take *now* to stabilize and expand this vital industry.

The important factors to consider in this connection are : raw materials, fuel and power, chemical plant, research, labour, transport facilities, and markets. None of these factors can be ignored if production is to be economical ; for the chemical industry has to reckon with several obstacles which are seldom present to the same degree in other industries : use of proportionately large amounts of heat and electrical energy, necessity of large-scale and continuous production, hazards in transportation and production, high ratios of salaries and capital investment to annual value of products, extensive research and control, and rapid changes resulting from scientific and industrial developments.

These requirements of the chemical industry must be carefully considered in the siting of factories, not only with a view to economical production and distribution, but from the standpoint of vulnerability in war.

In the matter of raw materials we are very fortunate. Labour is also available in abundance, though there is an almost unlimited scope for increasing its skill and efficiency. There are large sources of hydro-electric power waiting to be tapped. Coal, somewhat unevenly distributed over the country, is also available in sufficient quantities ; but it is particularly appropriate to stress here that this wasting asset should be most sparingly used for heat and power, and more utilized to obtain the numerous chemical products into which it can be transformed.

A vital consideration is the design of chemical plant. This is the field of the chemical engineer. He must attend not only to the mechanical strength of the materials of construction, but also to the corrosive action of the chemicals, the design and layout of the plant and other related factors.

The fabrication of chemical plant is in itself a highly specialized industry. The manufacture of chemical and allied plant has hitherto been neglected in India. Most engineering firms in this country are concerned mainly with structural engineering. Some do undertake repairs to chemical plant, and recently even the construction of complete units (such as sugar mills, soap plants, etc.) has been attempted. But the major part of the chemical plant required is imported at present. This is an unsatisfactory state of affairs for the building up of a stable chemical industry. Imports are, of course, necessary for purposes of immediate development. At the same time it is essential to make arrangements for the setting up of engineering shops devoted entirely to the manufacture of chemical plant. But to do this we need trained chemical engineers—and this presents us with another grave deficiency.

Instruction in chemical engineering is confined to a painfully small number of institutions here in marked contrast with the U.S.A. and other industrial countries. Not until the chemical engineer can undertake the manufacture of chemical plant in India, will the Indian chemical industry achieve real stability. Here again it is essential to " import " research specialists and other trained personnel until we are in a position to meet our own requirements.

There are numerous directions in which to expand our chemical industry. In the brief space at our disposal we can only list some of these : soda compounds, acids, electro-chemical and electro-metallurgical industries, fertilizers, coal products, silicate industries, oil and related industries, and the carbohydrate industries.

But expansion and progress spring from sound foundations. The requirements of a stable chemical industry are so wide in the matter of raw materials, plant, trained personnel, organization, research, statistics, transport, and markets, that co-ordinated control of the industry is a vital factor in its success. This truth distinctly indicates the desirability of making chemical production and distribution a national rather than a private enterprise. The State possesses powers, resources and facilities which are seldom available to organizations set up for private profit only. But State control, valuable as it is, must be sympathetic to the needs of, and active in its service to, the needs of the industry ; for bureaucratic methods and red tape would not hasten, but hamper, all progress.

Urged on by the pressing needs of war, the chemical industry has permeated and revolutionized the modern world. Our food, our homes, our clothes, and a thousand necessities and conveniences of everyday life depend on this vital industry. A well-established and progressive chemical industry offers a guarantee of national development and self-sufficiency.—*Efficiency News.*

Cultivation of New Species of Jute

A new scheme to explore fully the economic potentialities of new species of jute plants to be raised from seeds subjected to X-Rays and other radiations of different wave lengths and energies for the purpose of inducing hereditary changes in the seeds, is among the important subjects considered at the winter meeting of the Indian Central Jute Committee. The Director of the Bose Research Institute is the sponsor of this scheme, which is proposed to be worked out in collaboration with the Committee's jute agricultural research laboratories at Dacca.

Indian Mill Finance

Working of Textile Companies

Khandeish Spinning and Weaving Mills Co., Ltd., Jalgaon

(Agents: Indra Singh & Sons Ltd., Bombay)

The working of the company for the year ending 31st March, 1944 shows a net profit of Rs. 19,12,280-8-6, after providing for depreciation, viz., Rs. 74,205-1-0, to which being added the balance of Rs. 15,76,971-9-10 which was subject to taxation brought forward from the previous year, the total comes to Rs. 34,89,252-2-4 from which the provisional income-tax, corporation-tax and excess profits tax for the assessment year 1943-44 amounting to Rs. 8,05,097-6-0 is deducted; there remains a balance of Rs. 26,84,154-12-4 from which the directors have set aside Rs. 26,30,000 to reserve for taxation for the assessment years 1943-44 and 1944-45, leaving a balance of Rs. 54,154-12-4 which they recommend may be dealt with as under:—To pay a dividend at Rs. 60 per whole share and Rs. 15 per quarter share (free of income-tax), Rs. 45,000; and to carry the balance to next year's account Rs. 9,154-12-4.

The company's properties including buildings, machinery, stock and stock-in-trade have been adequately insured.

Coimbatore Pioneer Mills, Ltd., Peelamedu

(Agents: T. R. Narayanaswamy Naidu & Co.)

The working of the company for the year ending 30th June 1944, after providing for commission to the Managing Agents has resulted in a profit of Rs. 30,63,951-5-9. The following expenses have been written off in the profit and loss account: Depreciation on assets on written down value Rs. 64,667-13-3; bonus to staff and operatives Rs. 42,603-11-6 which leaves a net profit of Rs. 29,56,679-13. To this is added the previous year's balance brought forward of Rs. 9,627-10-2 which makes the balance of Rs. 29,66,307-7-2 available for distribution and the Directors recommend that this be appropriated as under: To transfer to reserve account from which the compulsory excess profits tax deposit will be paid Rs. 5,80,000; to provide for income and excess profits tax Rs. 22,86,207-1-0; to payment of dividend at 6½ per cent. to preference shareholders Rs. 6,500; to payment of dividend at 22½ per cent. free of tax on the ordinary shares Rs. 90,000; and to balance to be carried forward to next year Rs. 3,600-6-2.

The profits earned this year are the largest ever since the company commenced its business, in spite of the fact that the working of the company was much interfered with on account of plague and also of the control measures that had come into force during the latter part of the year.

The directors further report that a sum of Rs. 1,00,000 has been transferred from the general reserve account to the taxes reserve account to meet the previous year's excess tax paid over and above the provision made.

Coorla Spinning and Weaving Co., Ltd., Coorla

(Agents: Cowasjee Jehangir & Co., Ltd., Bombay)

The working of the company for the year ended 31st March 1944 shows a gross profit of Rs. 42,36,984-15-2. Last year the company carried forward a sum of Rs. 15,66,693-11-3 out of which a sum of Rs. 13,45,767-13 has been utilised towards the payment of income-tax, super-tax and excess profits tax. The company had also to pay during the year a sum of Rs. 2,26,470 as compulsory excess profits tax deposit, thus converting the carry forward of Rs. 2,20,925-14-3 shown in the balance sheet into a deficit of Rs. 5,544-1-9.

The directors propose to carry to a compulsory excess profits tax deposit reserve fund account a sum of Rs. 2,26,470 being the amount of the compulsory excess profits tax deposit made with Government last year. The deficit of Rs. 5,544-1-9 was met from the profits of the year.

The total gross profit of Rs. 42,36,984-15-2 is appropriated as under:—To dividend on 13,000 shares at the rate of Rs. 15 per share Rs. 1,95,000; to meet last year's deficit Rs. 5,544-1-9; to depreciation of machinery Rs. 27,000; to depreciation of buildings Rs. 20,000; to equalization of dividend fund Rs. 46,000; and to carry forward Rs. 39,43,440-13-5.

The mill buildings and machinery are insured for Rs. 33,23,760 and stores, cotton, stock-in-process and stocks of yarn and cloth have been insured for Rs. 24,92,000. The profits have also been insured for Rs. 18,00,000. In addition the buildings and machinery are insured against war risk for Rs. 21,96,000 and stocks are insured against war risk for Rs. 24,92,000.

Savatram Ramprasad Mills Co., Ltd., Akola

(Agents: Seth Savatram Ramprasad)

The profit and loss account of the company for the year ended 31st July 1944 shows a net profit of Rs. 6,02,790-0-3 which added to the balance of Rs. 1,61,628-2-9 brought forward from last year makes a total of Rs. 7,64,418-2-9.

During the year under review bonus shares of Rs. 3,77,500 at 50 shares of Rs. 5 each for every 106 shares of Rs. 5 each were issued and also an *ad-interim* dividend free of income-tax at 10 per cent. was paid which leaves a balance of Rs. 6,46,638-2-9 for appropriation as under:—Rs. 4,85,000 provision for taxation and Rs. 1,61,638-2-9 to be carried forward.

During this year the mills remained closed for more than four months due to coal shortage and labour trouble which hampered the profits to a great deal.

Model Mills Nagpur, Ltd., Nagpur

(Agents: Bansilal, Abirchand, Dadabhoy & Co., Bombay)

During the year ending 30th June 1944 the company made a net profit of Rs. 68,15,414-10-3. Adding to this the amount of Rs. 13,179-11-5 brought forward from the last year there remains a credit balance of Rs. 68,28,594-5-8. Out of this the directors have already paid on 17th April 1944 an *ad-interim* dividend of Rs. 8 per share absorbing Rs. 2,98,696 leaving a balance of Rs. 65,29,898-5-8, which they propose to appropriate as under:—Provision for all taxation Rs. 48,57,400; provision for compulsory deposit under E.P.T. Ordinance No. XVI of 1943 Rs. 12,76,400; payment of a final dividend at Rs. 9-8 per share free of income-tax Rs. 3,54,701-8;

balance to be carried forward to next year's account Rs. 41,396-13-8.

Considering the fact that during the year under report the mills remained closed for three months on account of labour strikes and coal shortage the directors state that the result of the year's working is satisfactory.

As the mills had made substantial profits the management decided to pay for the year under report also a war bonus under certain conditions to all the employees, who were on the rolls during the year at the rate of one-fourth of their total earnings for the period of 1st July 1943 to 30th June 1944.

The mill and dye-house premises and all other buildings, machinery and stock-in-trade and all other property belonging to the company have been fully insured against fire, war and riot and civil commotion risks. The profit and standing charges have also been insured against fire and civil commotion risks.

Indore Malwa United Mills, Ltd., Indore

(Agents: Govindram Seksaria, Bombay)

The working of the company for the year ended 31st December 1943 shows a profit of Rs. 58,22,086-14-1. This figure of profit is arrived at after paying (*a*) managing agency commission of Rs. 6,85,155-5 at 10 per cent. on profits, (*b*) selling agency commission of Rs. 3,03,591-2-6 at 1½ per cent. on gross sales of cloth and yarn, and office allowance of Rs. 4,277-6-9 from 27-5-1943 to 31-12-1943, (*c*) interest on 1st debentures amounting to Rs. 42,886-13-1 till the end of the year under report and (*d*) after providing Rs. 3,06,425 for Holkar Government housing scheme for the year 1943 and contributing Rs. 4,65,161 towards the Holkar Government scheme for the supply of cheap grains.

After deducting the sum of Rs. 1,395-0-8 being the difference in the interest paid less to the Managing Agents for the year 1942 the balance of profit of last year is reduced to Rs. 46,011-7-4. To this amount is added the sum of Rs. 58,22,086-14-1, making the total of Rs. 58,68,098-5-5. The Directors have set apart for depreciation on buildings, machinery, etc. Rs. 1,13,536-10-7 and for industrial and other taxes provision fund Rs. 20,00,000, leaving a balance of Rs. 37,54 561-10-10. Out of this the directors recommend a dividend of Rs. 111 per share for the year ended 31st December 1943, which will absorb Rs. 22,20,000 leaving a balance of Rs. 15,34,561-10-10 to be carried forward to the next year.

The profits and fixed charges for the current year have been insured for Rs. 10,00,000 against fire and insurance of Rs. 66,000 has been effected against breakdown of engine of both the mills and electric plant of the new mill.

The mill buildings, machinery, Indore and Kannod Ginning Factories together with the stock-in-trade are insured against fire for Rs. 1,80,46,160.

Clothing Supplies in Fifth Year of War

THE year 1943 was the peak year with regard to the supply of tailored items of clothing. India was then the nearest supply base for armies operating in the Middle East and in March 1943, over 12 million items were fabricated.

In the fifth year of war the ordnance clothing factories were called upon to supply just under 7 million items a month. With reductions in demands for clothing and with increased demand for parachutes it was possible to turn over one ordnance clothing factory completely to parachute work. Another factory has been split into two, one for clothing and the other for parachutes. There are thus now 8 ordnance clothing factories fully employed on fabrication of tailored items of clothing and necessaries, employing a labour force of 90,000 excluding the indirect labour employed by tailoring contractors throughout India. Some idea of the combined output of these factories during the period under review can be had from the fact that they accounted for and converted some 215 million yards of textiles, over 5,600 million yards of sewing threads and over 500 million buttons and numerous minor components into 78,941,597 tailored items of clothing and necessaries.

A striking feature of clothing supplies in the fifth year of war was the intensity of change and improvement in patterns, designs and modifications of clothing stores. There was a significant change in the character of the load. Demands for hospital clothing, prisoners of war clothing and clothing for Chinese troops were decreased, but the ordnance clothing factories met the requirements of the United States Forces in India. An increased quantity and variety of items were supplied to the Royal Air Force, Indian Air Force, Royal Indian Navy and the uniformed women's contingents. The battledress for the South East Asia and India Commands was produced in olive green and that for the Middle East in khaki.

The woollen industry which at one time was being entirely used for war production is now meeting civilian demands as well. Thus the value of army blankets has fallen from Rs. 3 crores in the previous year to Rs. 1,38,56,256. Purchases of silk and jute for war purposes continued to be made during the year.

REVIEWS

Commerce, Bombay : Annual Review Number. Price Rs. 5-0-0.

The latest Annual Review Number of *Commerce* is as usual replete with highly interesting and comprehensive contributions. Among them we may refer specially to those dealing with the role of universities in research planning, the problem of a fair and adequate wage, Indian labour in 1944, employer-employee relations, and industrial development as reflected in import and export trends. As regards mill re-equipment the writer observes that the cotton mill industry must strike a bargain with Government and mill machinery and other manufacturers abroad, in return for co-operation in the war effort, to obtain a guarantee that every facility will be rendered to the indigenous industry to secure its equipment not only during war-time but also after the cessation of hostilities.

The post-war prospects of the cotton mill industry have been dealt with at great length. In the present stage of development a revision of tariffs in favour of imports would appear to be likely, with all that it means in competition with foreign rivals. It is, however, certain that a fully developed internal market will readily absorb the entire production of the Indian industry, which will have to be thoroughly overhauled in the matter of methods and machinery. And it is here that out and out rationalization is advocated. " Groups of competing firms," we are told, " must pool their resources, exchange labour and personnel, develop group buying to advantage, maintain overseas markets, agree to simplify production, concentrate output in the most efficient units, pursue joint purchases and sales and scientific research and so on.... Different sections of the industry will have to organize themselves into " a series of self-sufficiency groups or areas linked together inter-regionally by agreements covering, on the one hand, branches of the industry in which capacity will normally tend to be in excess of demand and, on the other, raw materials, of which the supply is localized. . . Each group could then become a 'vertical cartel,' cut-throat competition regarding prices and qualities will become a thing of the past." The mills have only to join together and set up a central organization on the lines of the Associated Cement Companies and the trick will be done !

The picture is quite attractive, but is it quite so easy as all that ? Is the analogy on all fours ? Is there any comparison between the number of A.C.C.'s constituent units and those in the mill industry ? The A.C.C. was floated when protection was denied to the industry and its prospects were bleak if it did not combine. Are circumstances regarding the cotton mill industry identical or even more or less similar ? The 1930 Bombay attempt at bringing about a mill merger on a comparatively small scale failed owing to " technical and other difficulties." Are these difficulties no less present to-day than in 1930 ? These questions, of course, do not receive an answer in the otherwise able review of the cotton mill industry which we have been discussing.

Social Insurance Planning in India. By A. N. Agarwala, M.A. Published by East End Publishers, E/82, Allenganj, Allahabad. Price Rs. 5-12-0.

At a time like the present when social insurance is so much in the air, the above comprehensive book makes a timely appearance. The actuarial, financial, economic, historical, administrative and other aspects have been discussed in detail. The author has considered the various issues in relation to the special conditions obtaining in India and has succeeded in bringing out a book that should be of great help alike to the economist and the student, the industrialist, the labour welfare officer, as well as to the trade union leader.

NOTICES

Our Sterling Balances. By Bhuvaneswar Swarup Bhatnagar. Published by the Business Bureau, Allahabad University, Allahabad, 1945. Price Re. 0-8-0.

" Our Sterling Balances " is the title of a paper read by Mr. Bhuvaneswar Swarup Bhatnagar before a meeting of the Business Bureau, an association of post-graduate students of commerce of the Allahabad University.

The author first examines briefly the manner in which sterling balances have come into existence and have accumulated. Then he proceeds to indicate their importance and, finally, he surveys and evaluates some of the doubts, misgivings and dangers which have been expressed or have arisen; and, what is important, he suggests ways and means to safeguard and utilize them to the best advantage of the country.

Journal of the Bradford Textile Society (1942-43 and 1943-44). The Society celebrated its golden jubilee in 1943-44 and an account of the celebrations is included in the volume under notice. It contains, as usual, accounts of the various papers read and speeches delivered during the two years 1942-43 and 1943-44; these papers cover a variety of subjects like novelty in the production of fabrics, preparation of warp yarns for the loom, the effect of twist on yarn and cloth, psychology of colour, colour in relation to design, modern systems of drawing and spinning, processing wool fibres, yarns and fabrics, plastics in the textile industry, future of wool textile industry, economics of factory planning and the training of personnel.

The "Indian Home" Magazine. Published and edited by Mohan V. Raj, M.A., B.Sc. (Minn.), for the Indian Home Publications Ltd., at 47, Lakshmi Building, Sir Phirozeshah Mehta Road, Fort, Bombay. Single copy Re. 1 and annual subscription, Rs. 13.

The eighth anniversary number of the *Indian Home* is full of articles such as "Back from the Services," "To Get Things Done," "Films that Educate and Entertain," "India Village," "Servant Problem in India" and other special features that make interesting reading. This magazine is devoted to the entire family, giving current and civic matters for the father, domestic and social information for the mother, and educative entertainment for the child.

The Ahmedabad Millowners' Association: Annual Report for 1943. Price Rs. 10-0-0.

The Report, as usual, gives a list of members, succession list of chairmen and members of the managing committee for 1944-45. This is followed by the speech delivered by the President, Mr. Sakarlal Balabhai, at the latest annual general meeting of the Association and by the text of the Report proper.

Bengal Millowners' Association, Calcutta: Report for the Year 1943 (Abridged). In addition to the report of the Committee of the Association, its statement of accounts and proceedings at the annual general meeting of 1944, the report contains also the presidential address delivered at the quarterly meeting. A valuable feature is the inclusion of a list of members and a list of the cotton mills at work in Bengal as well as a chart illustrative of the progress of cotton mills in India, taken from the Millowners' Association, Bombay.

Safety First Association of India, Electric House, Colaba, Bombay. We learn from the twelfth annual report of the Safety First Association of India that in the field of industrial safety the Association rendered valuable service to factory executives with advice and suggestions. The Association's posters were in great demand and a revised edition of the resuscitation chart in English, Marathi and Hindi was published.

With industry geared to its present high level, the year has been one full of activities for the Bombay Provincial Branch also. The main feature has again been propaganda. The Association's chart on "Resuscitation" was published in Hindi. Many problems have been submitted to the Committee for expert advice, and they have also kept abreast of new developments in industry in this country. The Committee also arranged several demonstrations on first-aid, etc., for the benefit of mill workers, and co-operated with the Labour Welfare Department of the Government of Bombay in arranging safety first stalls in all their exhibitions.

Distribution of Electricity, October 1944. Published by W. T. Henley's Telegraph Works Co., Ltd., Milton Court, Westcott, Dorking, Surrey, England. The firm announces a four-year scholarship tenable at the Gravesend Day Technical School, for competition among the sons of Henley employees. The scholarship will be awarded annually on the results obtained in the Entrance Examination held at the Technical School in March every year, to the son of Henley parents attaining the highest position in this examination.

J. K. Review, Vol. 4, contains interesting articles on the ratio between capital and income, on artificial resources and agricultural experiments, and on India's mineral sources.

CALENDARS AND DIARIES FOR 1945

Commercial Art Engravers, leading block makers of Bombay, have sent us two copies of their excellent wall calendar and a copy of their card calendar for 1945. Sundays and holidays are marked in red and the public holidays are listed on the reverse of the card calendar: an excellent wall calendar in red and blue has also been received from **Tyebally Dawoodbhoy Rangwalla,** Bombay, stockists of J. & N. quality paints and Gourepore linseed oils.

The Hindustan Colour, Chemical and Manufacturing Co., Ltd., Kathwada (Baroda State), have sent us, as usual, an excellent wall calendar for the current year.

The Bombay Yarn Exchange, Ltd., Hanuman Building, Tambakanta, Bombay, have as usual sent us a copy of their card calendar for 1945.

The General Electric Co. (India), Ltd., has as usual sent us their calendar re-fill and reminder sheet.

Messrs. J. S. Holt & Moseley, Ltd. of Manchester, England, have sent us a beautifully printed and illustrated wall-calendar.

Messrs. Volkart Bros., Bombay have sent us a beautiful wall calendar, with two months to a sheet, each sheet bearing a different illustration in colours by Prof. W. Langhammer.

Graton & Knight Co., tanners and leather belting manufacturers, Worcester, Massachusetts, U.S.A., have sent us a fine large wall calendar whose chief attraction is a fine painting in colour of feminine charm.

NEWS OF THE MONTH

Indian

Textile Labour Union for Surat.—A textile labour union on the lines of the Ahmedabad one is to be formed in Surat.

The decision was recently taken at a meeting of textile workers under the Presidency of Mr. Gulab Bhai Desai, President of the City Congress Committee.

New Era Textile Mills Cloth Shop.—A retail cloth shop of the New Era Textile Mills Ltd., has been opened at 5-12, Queen's Road, Bombay, since the 9th instant, where silks and art silks will be available at a price complying with the Hoarding and Profiteering Ordinance and to genuine consumers.

Bombay Working Class Cost of Living Index.—During December, 1944, the working class cost of living index number for Bombay, with the average prices for the year ended June, 1934, equal to 100, was 236. This was six points lower than in the preceding month. The index number for food articles declined by 10 points to 267.

Textile Engineer Wanted for Spun Silk Mills.—Mr. K. Shamsuddin Khan, Manager, Mysore Spun Silk Mills, Ltd., Channapatna, has advertised for the services of a textile or mechanical engineer for work in Spun Silk Mills. Persons with qualifications and previous experience may apply and the salary will be fixed according to qualifications.

Calcutta Office for Nagindas Kilabhai & Co.—Nagindas Kilabhai & Co., importers and suppliers of sizing, chemicals and millstores, of Lalgir Chambers, Tamarind Lane, Fort, Bombay, and Reid Road, Railwaypura, Ahmedabad, have now opened their offices in Calcutta also, the address being Third Floor, No. 10, Canning Street, Calcutta.

Industrial Training in Bombay Province : Decrease in the Number of Students.—There were 3,811 students attending 76 technical and industrial training institutions in Bombay Province in 1942-43, against 4,330 in the previous year. The total grant-in-aid paid to institutions under the control of the Board of Technical and Industrial Training during the year was Rs. 41,108.

Textile Calendar

JANUARY

18th, Thursday :

Institution of Engineers (India), Bombay Centre, Annual General Meeting, Electric House, Bombay.

Marwari Chamber of Commerce, Calcutta, Third Quarterly Meeting.

13th, 14th and 15th, Tuesday, Wednesday and Thursday :

Conference of Provincial and State Representatives with Government of India authorities in Bombay to finalize Central Distribution Scheme.

14th, Wednesday :

Africa and Overseas Merchants' Chamber, Bombay, Annual General Meeting.

24th and 25th, Saturday and Sunday :

Fifth All-India Manufacturers' Conference, New Delhi, Sir M. Visvesvaraya presiding.

27th and 28th, Tuesday and Wednesday :

Second All-India Textile Conference, Bombay, inaugurated by Sir Joseph Kay, Kt.

MARCH

1st, Thursday :

Second All-India Textile Conference, Bombay.

14th, Wednesday :

Bombay Chamber of Commerce, Annual General Meeting.

17th, Saturday :

25th Silver Jubilee Annual Conference of the Mechanical Engineers' Association (India) at the B. E. S. T. Conference Hall, Bombay.

High Grade Technological Institute in India : Government's Proposal.—It is understood that the Government of India are appointing a committee to consider the establishment of a high-grade technological institute in India on the lines of the Massachussetts Institute of Technology.

The Committee, which may be presided over by Mr. N. R. Sarker, will consist of men interested in business, applied science and technological education.

Technical Training for Indians: Students to be Sent Abroad.—About 500 students will be sent abroad in autumn this year for a course in technical subjects directly related to various plans for post-war development now under consideration, says a Press Note. These students will be selected by the Central and Provincial Governments, and financial assistance required to enable the students to complete the approved course will be provided.

Cotton Consumption.—Consumption of Indian cotton by the cotton mills in the country during November, 1944, was 359,378 bales as against 362,424 bales in the corresponding month in 1943, states a *communique* from the Indian Central Cotton Committee. It adds that during the first quarter of the current cotton year consumption totalled 1,034,682 bales as compared with 1,068,619 bales for the corresponding quarter of the preceding year.

Cloth Famine Leads to Strange Crimes.—Cloth scarcity recentlly gave rise to a revolting form of crime in Lucknow. Several cases were reported of graves being dug open by thieves with a view to robbing the dead of their shrouds.

One bereaved woman visiting her daughter's grave was shocked at the desecration perpetrated by these cloth thieves. The police have kept a sharp look out for these "grave diggers," and seven suspects have already been arrested.

Increase in Imports and Exports of Goods.—Both the import of foreign merchandise and export of Indian merchandise were higher by Rs. 42 crores and Rs. 16 crores, respectively, in the first half of the current fiscal year, as compared with the corresponding period of last year. The former amounted to Rs. 94 crores as against Rs. 52 crores last year and the latter to Rs. 109 crores as against Rs. 93 crores last year. These figures do not include the value of either imports or exports on defence account.

Extra Cloth and "Atta" Ration for Heavy-weight Film Star.—It is reported that Mr. S. P. Jani, Local Civil Supply Officer of Lahore, has sanctioned eight yards of double width serge to make a single suit length for the film star Durga Mota, whose chest and waist measured 60 and 63 inches respectively, after his recent loss in weight of 80 lbs. due to the introduction of food rationing. The Lahore rationing authorities have promised the starving star additional quotas of *atta* and sugar to help maintain his unique physique.

Interim Dividends Declared by Hyderabad and Mysore Mills.—The ninety-third interim dividend at the rate of Rs. 100 per share, for the year ending 1944, was declared by the Board of Directors of the Hyderabad (Deccan) Spinning and Weaving Co., Ltd., Secunderabad, at their meeting held on 17th January, 1945.

The Directors of The Mysore Spinning and Manufacturing Company, Limited, have determined to pay an interim dividend of Rs. 2 and a bonus of Rs. 4 per share of Rs. 50 for the half-year ended 31st August, 1944.

Ahmedabad Textile Dispute.—The Textile Labour Association has approached the Conciliator appointed by the Government under the Bombay Industrial Disputes Act to start conciliation proceedings in connection with the dispute regarding payment of four months' bonus and compensation for stoppages due to coal shortage. As regards the payment of bonus, the Labour Association states that it would roughly amount to Rs. 1,80,00,000 and that it is very easy for the industry to satisfy this demand from a gross profit of about Rs. 18,00,00,000.

The Mechanical Engineers' Association (India): 25th Silver Jubilee Annual Conference.—The Twenty-fifth Silver Jubilee Annual Conference of the Mechanical Engineers' Association (India) will be held on 17th March 1945 at the B.E.S.T. Co., Ltd., Conference Hall, Bombay, and Mr. G. F. S. Collins, C.S.I., C.I.E., O.B.E., I.C.S., Adviser to the Governor of Bombay, will inaugurate the function. The Association is an all-India body and on this occasion it has made an appeal for funds to the industrialists and the general public to enable it to establish itself on a firm foundation and to be more useful in the future industrialization of India. In this connection, it is also proposed to hold an exhibition under the guidance of influential business men on 15th March 1945.

Concession to Mulberry Growers in Kollegal.—In view of the importance of the sericulture industry, the Madras Government issued orders in December 1943 for the permanent assignment of 10,000 acres of compact blocks of assessed and unassessed waste lands in Kollegal Taluk, Coimbatore District, on condition that the ryots to whom a permanent assignment had been made grew only mulberry on these lands. The Government have now directed that the condition that mulberry only should be cultivated be relaxed in favour of the "landless poor," that is, those ryots who are unable to take up more than four acres for cultivation. These "landless poor" will be permitted to grow food crops to an extent not exceeding one acre out of the area assigned in each case for planting mulberry.

Indian Industrial Delegation to Australia.—A group of Indian industrialists is now visiting Australia to explore the possibilities of closer commercial and industrial relations between the two countries, particularly during the post-war period.

The delegation consists of Sir Datar Singh, Punjab; Mr. Neville Wadia, Bombay; Mr. Abdul Wahid Dawood, Calcutta; Mr. Ram Rattan Gupta, Cawnpore; Mr. Visvanath, Mysore; Mr. Shanti Prasad Jain and Mr. Michael Brown (Secretary).

The party are the guests of the Commonwealth of Australia and they will make an extensive tour of industrial centres, many of which have developed very considerably since the outbreak of war.

At present India supplies most of the cotton textiles used in Australia, while very large quantities of Australian wool and wheat are being sent to India.

Madras Government's Grant to Annamalai University.—The Government of Madras, it is understood, have sanctioned Rs. 10 lakhs, non-recurring grant, and Rs. 2 lakhs recurring expenditure to the Annamalai University for the starting of a School of Technology. The University has chosen a site and initiated acquisition proceedings in respect of other buildings in the vicinity, immediately essential for the purpose.

The School of Technology will include Physical Science Laboratory, Chemical Science Laboratory, Electrical Science Laboratory which will also include a Mechanical Engineering Workshop, a Hydraulic Laboratory and a Strength-of-Materials Laboratory.

It is also understood that an Advisory Committee has been constituted, consisting of experts in the line. The School of Technology will function from July, 1945.

Manufacture of Rayon and Plastics in India.—Speaking on the subject "Building a New India" in the A.I.R. broadcast from Delhi on 10th January 1945, Mr. J. B. Vesugar, Industrial Adviser to the Government of India, stated that notwithstanding large forests in various parts of the country, India is short of the finer variety of woods. It will take many decades to make up the deficiency even if it were feasible. We should, therefore, concentrate on building up a plywood industry.

Practically all the resources are available for manufacturing rayon and plastics. As for artificial silk, it will for some years be necessary to import pulp—as Japan has always done—but with experience of the industry and intensive research, it should be possible to develop indigenous sources of cellulose. The establishment of coal distillation, alcohol and chemical industries will make many products available for various synthetic industries.

Area Under Cotton: Official Forecast.—The area under Indian cotton during the 1944-45 season is estimated at 12,957,000 acres, representing a decrease of 23 per cent. compared to the revised estimate on the corresponding date last year, states the second official crop forecast issued by the Department of Commercial Intelligence and Statistics, Calcutta, a few days ago.

The forecast is based upon reports which generally relate to sowings made up to 1st October last. On the average of the last ten years, the area reported in the second forecast has been 83.4 per cent. of the total area reported in the final (April) forecast.

The following are the present estimates of area, classified according to the recognized trade descriptions of cotton:—

Bengals 1,661,000 acres, Americans 3,363,000 acres, Oomras 3,631,000 acres, Broach 430,000 acres, Surti 307,000 acres, Dholleras 759,000 acres. Others 2,806,000 acres, total 12,957,000 acres.

Cawnpore Mill Directors Fined on False Coal Returns Charge.—Fines aggregating Rs. 41,500 were imposed by the District and Sessions Judge, Cawnpore, on 31st January 1945 on some directors of the J. K. Cotton Spinning and Weaving Mills, and their employees in two coal cases under Defence of India Rules 116, 117 and 122. The coal was ordered to be confiscated.

Trial Cotton Cultivation in Aramboly Dry Crop Farm.—The Travancore Agricultural Department initiated trial cultivation of cotton in the Aramboly Dry Crop Farm, and encouraged by the results obtained, the Department decided last year to bring 100 acres of land in the Mahindragiri Fuel Reserve under cotton cultivation. The area was leased out to a local ryot and the cultivation started early this year under the control and guidance of the department. The results obtained have been very satisfactory. The cotton harvested was supplied to local spinners. It is estimated that some 20,000 acres, stretching from Aramboly to Cape Comorin, can be brought under cotton as the soil and climatic conditions are favourable for the cultivation of this crop.

Industrial Stoppages in British India : Decline in Number of Man-days Lost.—One hundred and fifty-nine industrial stoppages, involving 163,126 workers and resulting in the loss of 1,180,877 man-days, occurred in British India during the first quarter of 1944. In the same quarter of the previous year there were 311 stoppages involving 286,515 workers and resulting in the loss of 1,354,263 man-days.

There were eight stoppages involving 5,000 or more but less than 10,000 workers and one involving 10,000 workers or more. In two stoppages 100,000 or more man-days were lost; in one of them the number of workers involved was less than 5,000.

Textile (cotton, silk, woollen and jute) mills accounted for 31 per cent. of the unmber of stoppages, 56 per cent. of the workers involved and 80 per cent. of the man-days lost. In 100 stoppages or 63 per cent. the demands related mainly to wages or bonus.

The number of stoppages in which the workers were wholly or partially successful was 53 or 36 per cent. of the total number of stoppages which ended during the quarter and in 89 cases or 60 per cent., the workers were wholly unsuccessful.

Foreign

Arundel Coulthard & Co., Ltd., Declare Dividend.—The Directors of Arundel Coulthard & Co., Ltd., well-known textile machinists of Stockport, England, announce a net profit of £12,430 on the twelve months against £16,352 a year ago. The dividend is again 4 per cent., less tax. It is proposed to convert the shares into stock.

Cotton Shortage in China.—To relieve shortage of fine cotton, the Chinese Ministry of Finance will organize the Yunnan Cotton Corporation in collaboration with the Yunnan Provincial Government and those interested in the cotton industry, it is learned in Chungking. Plans are being studied and a Cotton Yarn and Cloth Control Committee will be organized to proceed with preliminary work.

Textile Machinery Exports from Great Britain.—Textile machinery is still being exported although Lancashire millowners have difficulty in getting spare parts. Board of Trade returns show that last year 13,010 tons were exported compared with 70,776 tons in 1938, the value being £4,695,379 against £8,407,354 respectively. British India was the biggest importer with a total of 7,887 tons while the United States took 743 tons, Australia 760 tons, Canada 313, and other British countries 991 tons. The remainder went to neutral countries.

Textile Refresher Course for Ex-Service Men.—The Department of Textile Industries of the University of Leeds, England, according to Professor J. B. Speakman, its head, has received numerous letters from men in the forces inquiring what steps have been taken to help them to renew their acquaintance with the wool textile industry when demobilization begins. Their anxiety has arisen largely because so many new textile fibres have been developed and brought into service in conjunction with wool during the war, says the *Manchester Guardian*. The department, accordingly, has devised a three months' refresher course for service men who have had previous training in textile technology.

Textile Trade Representative in Overseas Trade Development Council.—Out of sixteen appointments made by the Department of Overseas Trade in Britain to the Overseas Trade Development Council, which has been reformed and is to meet regularly to study methods of export trade promotion and the nature and extent of Government support, the textile trade has only one representative, Mr. Angus D. Campbell, a Director of Forbes Campbell & Co. and G. & R. Dewhurst Ltd., merchants and shippers. He is a past President of the Manchester Chamber of Commerce of which he is now a Director, and has been on textile missions to India on three or four occasions.

1944 Edgar Marburg Lecture on Textile Fibres.—A most interesting Marburg Lecture was presented at the annual meeting of the American Society for Testing Materials at Pittsburg, Pa., U.S.A., by Dr. Harold DeWitt Smith on the subject "Textile Fibres—An Engineering Approach." Dr. Smith devoted much time to preparing material that would be of interest not only to textile technologists, but especially to the large and diversified group of consumers of all kinds of textiles. He has stressed the importance of a study of mechanical properties of textile fibres in relation to the desired properties in yarns.

British Help for Continental Textile Industries.—Sir Frank Platt, Cotton Controller, has returned to England after leading a British Textile Mission on a tour of textile centres in France and Belgium. The object of the visit was to ascertain what help is required to enable the textile mills of those countries to start up again and particularly to find out to what extent they can be used to produce yarn and cloth required by the Forces. Many French and Belgian mills were undamaged and if the machinery can be put in good order and suitable labour obtained it is thought that supplies of raw cotton could be sent to enable cotton yarn and cloth to be turned out. The matter is now being considered by the Ministries of Supply and Production in the light of the Platt Mission's report.

Proposal to Start Textile Mills in Angola and Mozambique.—According to a report from Lisbon in the current fortnightly review of the Bank of London and South America, the Portuguese Government has published a decree authorizing the formation of a society to establish a cotton textile plant in Angola and another in Mozambique, with an initial capital of 100,000,000 escudos (about £1,000,000). An installation commission has been appointed, comprising representatives of firms and individual traders in the Portuguese textile industry, all of whom have the option of subscribing to the capital of the new venture, the proportion of their shares to be based on their output capacity. It is estimated that the total funds required to complete the project will amount to some 250,000,000 escudos.

Textile Institute Awards Research Studentship.—In May, 1943, the Textile Institute, Manchester, announced inauguration of a scheme for the award of Research Studentships. The first award has now been made to Mr. R. L. Kitchen, A.T.I., of Huddersfield. In accordance with the scheme, facilities for research are being provided by the University of Leeds. Mr. Kitchen is undertaking investigations on "The Action of Hypochlorites and Related Compounds on Proteins, with Special Reference to their use in Rendering Wool Unshrinkable."

The proposals for the provision of facilities in connection with the research studentships came, in the first instance, from the University of Leeds. The Institute states that proposals from other educational bodies on similar lines would receive equal and sympathetic consideration.

Demand for British Textile Machinery in Post-war Period.—The output of British textile machinery in the post-war years will probably be the highest ever, states the *Financial News;* £70,000,000 is the estimated value of the orders which the home cotton industry alone will place during the first five years after the end of hostilities. In addition the British wool textile industry contemplates a big renewal of plants and is negotiating with machine manufacturers and the Board of Trade with this aim in view. The silk and rayon industries will also swell the volume of orders and an additional demand will come from hosiery, hemp, jute, knitting and carpet trades. Exports are also expected to expand. Large overseas contracts are already in sight and the post-war years, says the paper, should furnish better returns than 1937 when the United Kingdom exports of textile machinery exceeded £8,000,000 in value. The President of the Board of Trade, Mr. Dalton, has already arranged an increased allocation of iron and steel for textile machinery makers and production will expand progressively as manufacturers are released from war contracts.

Modernization Plan for Canadian Textile Mills.—Textile mills in Canada are anxious to begin their extensive plant modernization programmes, which have been planned for many months. Continuous night and day operations throughout the war period and lack of new machinery during the last two years have greatly increased wear and tear and obsolescence. The industry is converting plant for large-scale production of civilian goods, although the supply position is acute on certain lines. During the ten years from 1930 to 1939 inclusive, Canada's mills spent $3,500,000 annually on imported special machinery, mainly from the United States and Britain, with the former supplying the bulk of requirements. The value of machinery imports from the United States averaged $2,600,000 annually, while the average annual value of machinery imported from Britain totalled around $700,000. Small quantities of machinery were imported from Germany, France, Switzerland, and Italy.

Mills in Canada are most anxious to obtain British cotton spinning and woollen and worsted machinery, as they do not wish to rely on the United States as the sole source of supply. Consequently any measures evolved by the British Government to expedite the manufacture of textile machinery for Canada will be welcomed.

A.S.T.M. Receives Ordnance Distinguished Service Award.—At a special meeting of the American Society for Testing Materials in Philadelphia on 12th October Major-General G. M. Barnes, Chief, Technical Division, Army Ordnance Department, presented to the Society the Ordnance Distinguished Service Award, this having been authorized some weeks earlier. President P. H. Bates, National Bureau of Standards, received the award for the members.

In tendering the award, which was made " In recognition of outstanding and meritorious engineering advisory services, in war and peace, for the development, manufacture and maintenance of Ordnance material," General Barnes stressed the great uniformity, reliability and quality which ordnance material must have, the quality being insured by proper and adequate specifications.

In accepting the award, President Bates referred to the extensive A.S.T.M. wartime work resulting in emergency standards and provisions, the widespread use of the Society's specifications, and cited a number of projects which were connected with activities of the armed services.

In referring to General Barnes' suggestion that the Ordnance Department, A.S.T.M. activities continue in peacetime, he stated that A.S.T.M. would most certainly co-operate.

Fifty Years Ago

(From the *Indian Textile Journal*, February 1895).

Adulterated Lubricating Oil

" It has come recently to our knowledge that a brisk business is being done in adulterated mineral lubricating oil in Bombay to the prejudice of honest dealers . . . the slovenly manner of buying stores for mills which exact no guarantee of quality makes it easy for anyone who can lie picturesquely to mix kerosene with spindle—or shafting-oil and sell it at an alarming sacrifice. It is only in India that such a barefaced swindle would be possible. Thinning mineral spindle oil will very soon result in the rapid wear of spindles and the saving in first cost of oil will soon be swallowed up twenty times in repair of machinery. We wonder how many of our local oil contractors would survive a really strict supervision of their deliveries."

Distribution

IN January last we referred to a new scheme of distribution which was expected to put an end to black markets and to assure to each province its predetermined quota. Under it mills and quota-holders in Bombay were each divided into 14 groups. Each group of quota-holders received goods from its respective mill-group, each quota-holders' group containing about six leading men selected by themselves to arrange the details. Further, members were selected, one from each quota-holders' group, to form a committee of 14 with whom the up-country buyer's requirements were negotiated. This committee of 14 sent particulars of its requirements on prescribed forms to the Provincial Textile Controller. After scrutiny, permits were passed to a cloth distribution panel of ten members, who then returned the permits with their authorization to the committee of 14, and the latter undertook to deliver the goods to the parties concerned. The cloth distribution panel advised the Textile Commissioner regarding the arrangements necessary to secure the proper distribution of the cloth manufactured and bought in Bombay to destinations outside the Bombay surplus area. No cloth bales could be despatched outside Bombay without a permit issued by the Textile Commissioner through the cloth distribution panel.

While the foregoing arrangement must be said to have worked smoothly in Bombay, the cry of shortage and black marketing in the up-country centres began to swell in volume and it was realized that the system obtaining in Bombay should be extended to the other centres also and that the different provinces and States should be enabled to work under more or less equal conditions. Accordingly, groups of quota-holders have been formed in manufacturing centres to despatch goods to the deficit zones under the supervision and control of the trade associations and Government representatives. Provincial Governments have been asked to select, in consultation with the dealers' associations, certain dealers who were in the trade in the basic period 1940-41-42 and to authorize them to purchase goods from the manufacturing centres. Quota-holders or " A " dealers, wholesalers or " B " dealers and retailers or " C " dealers were the three classes into which the trade was classified. A quota-holder can sell cloth only to a " B " dealer or dealer nominated by the deficit zone to purchase cloth on its behalf; a " B " dealer can purchase cloth only from an " A " dealer and must sell only to the " C " dealer or retailer; a " C " dealer or retailer can purchase cloth only from a " B " dealer and he can sell only to the consumer in retail. At the same time the provincial Governments are reported to have been asked to revise their licensing systems with a view to reducing the number of licences as much as possible.

The Government of Bombay have, therefore, set about in right earnest to tackle the distribution end of the trade. Under the Bombay Cloth Trade Regulation Order 1945, which came into force in Bombay and Ahmedabad on 1st of March 1945, no buying or selling of cotton piecegoods in the trade will be possible except in terms of a licence. Dealers have been divided into six different classes, viz., quota-holders, wholesalers, retailers, commission agents, hawkers and others, and different licences and forms, and different licence fees and other regulations governing the issue and renewal of licences, as well as penalty clauses for infringement of the order, have been laid down. There are also regulations regarding the display of price lists, the issue of cash memoranda and the submission of quarterly stock returns. The licensing authority, who is the Provincial Textile Controller in Bombay, is empowered to direct a dealer to supply at specified rates to specified parties and within specified periods and to issue special or general directions regarding the storage, sale and transport of cloth. He can also call for information, inspect accounts and stocks, and enter and search any premises. With more or less similar arrangements made in Ahmedabad also, it is to be hoped that we will hear less of black markets in the cloth trade.

Textile Men Confer

FOR the second time in the history of the Indian cotton mill industry, the mill managers, weaving masters, spinning masters and other technical staff as well as the mill engineers and labour officers have met and dispersed. The first All-India Textile Conference, which met in Bombay last March, was inaugurated by Sir Victor Sassoon, Bart. The second conference, which met also in Bombay on the 27th and 28th February and 1st March 1945, was inaugurated by Sir Joseph Kay, Kt. India is the second largest cotton textile manufacturing and exporting country in the world, America standing first. Its importance in the world cotton textile economy, which the war has underlined, will continue to grow in the immediate post-war years of acute world textile shortage, and the technical staff employed in the Indian cotton mills have come together, therefore, not a day too soon. Until last year they lacked a common platform for the expression of their views on the machinery and processes of production as well as on their own conditions of work and employment. They had no representative organization for the mutual interchange of opinions and experiences and for the establishment of social contacts among themselves. Now this gap has been more than filled by the Textile Association (India) and the annual conferences conducted by it in collaboration with the Victoria Jubilee Technical Institute, the pioneer technological institution in the country. The second conference which met last month had the usual quota of discussions and papers, an exceptionally fine exhibition of textile accessories, processes and fabrics, and programmes of drama, dance and music, while the whole show was rounded off with the customary instructional visits to mills and laboratories for the up-country members and visitors.

In the course of his inaugural address Sir Joseph Kay dwelt on the present and future prospects of the Indian cotton mill industry, its post-war rehabilitation and re-equipment problems, the implications of the Platt Report, the necessity for more provision for technical training and research, reorientation of the labour movement, and the future of official control. He was hopeful that in the absence of competition and price-cutting from without, Indian mill and handloom production should be able to sell at remunerative rates and satisfy the entire internal requirements; if production is stepped up more and more export markets should also come within their reach. It is here appropriate to draw the reader's attention to Sir Joseph's remarks on the unsatisfactory packing of Indian piecegoods. This has been a matter of constant complaints from India's oversea customers, specially East Africa and Australia, and the Indian Trade Commissioners in Mombasa and Sydney have time and again emphasized the need for more careful packing and labelling of cases.

Sir Joseph's optimism about the future of the industry was tempered, however, with caution, when he referred to the introduction of new fabrics, possible changes in fashion, labour legislation and security schemes and the possibility of Government control outliving the emergency that brought it into being. Increased demand for textiles and inflationary causes having contributed to high prices and black markets in textiles, there can be no conceivable reason for the continuation of rigorous control once conditions return to normal. This reminder from Sir Joseph has come at a time when the air is thick with proposals for the nationalization or State-ownership of industries. During his budget speech, Sir Jeremy Raisman, Finance Member, hinted at the prospect of State-owned industries as a means of additional revenue. Even when considered from the purely academic point of view, equally strong arguments have always been forthcoming as much for the system of private enterprise and ownership as for the system of State control and ownership. While it may be considered that the advantages accruing from State ownership far outweigh other considerations when transport, irrigation and power industries are concerned, the same cannot be said with any degree of plausibility about consumption goods industries like cotton textiles. Dealing with machinery replacements and renewals, Sir Joseph Kay emphasized the responsibility of the technical staff for formulating their plans always in the light of what they expect to earn from the capital outlay.

Cotton Textile Industry in India and the United Kingdom

Post-war Improvements and Policy

By T. MALONEY, M.C., A.M.C.T.

(*Specially Contributed*)

THE public pronouncements of the Chairman of the British Cotton Board, Sir Raymond Streat, are almost invariably interesting and illuminating. His address to the Oldham Textile Society of the 26th January was no exception. He was speaking on the aims of post-war policy and, in the course of his speech, named six essentials which he thought desirable for creating the necessary conditions for the resuscitation of the Lancashire industry. Some of these might also be borne in mind by manufacturers in India whose many post-war problems will resemble those of Lancashire.

The six essentials are:—

(1) "To get the right outlook in the industry all sections must be in it for more than a livelihood."

What Sir Raymond was apparently thinking was that millowners must not treat the unions which they control merely as instruments of private profit, but as integral parts of a national economic asset. This, to my mind, implies that the organization and the future character and development of the industry should be on a planned, co-ordinated, scientific and efficient basis. Before leaving India, nearly two years ago, I made a similar plea for co-ordinated action in the planning field and should, at this juncture, like to repeat the need for it.

(2) "Strengthening of the organizational structure. The world of to-morrow will make short work of the brilliant but entirely selfish man, or firm, who insists on going his own way completely regardless of anything outside his ken or beyond his immediate interest."

It can hardly be denied that in many directions the organizational structure of the Lancashire industry requires strengthening. This must be so in the case of a pioneer industry which has been gradually built up, over a very long period of years, by the initiative, skill, and spirit of adventure of practical spinners, weavers, finishers, and individual firms of merchant distributors. There has so far been comparatively little co-ordinated planning by the industry as an entity and the sectionalization of the industry into what have become almost separate trades, with inadequate connecting links, will undoubtedly add to difficulties of Government and of those who control the industry in their task of rationalization. What to me seems most urgently needed is an increase in the number of vertical combinations whose activities would cover every process of manufacture incidental to the production of the completely finished materials in which they specialize. Failing vertical combinations, considerable improvements could probably be effected by a growth in the number of horizontal combinations in which, for example, the particular equipment of a spinner could be canalized for the production of yarns of the counts and qualities, and in the form required, by a weaving concern or a group of weaving concerns making standardized and specialized cloths. Allied to, or working in close co-operation with, such a combination, there might and, generally speaking, should be a finishing and, where needed, a printing plant. The whole should then be linked to an adequate merchanting organization. It can, of course, be argued that actual amalgamation of the various manufacturing units essential for the production of particular types of specialized fabrics would tend to destroy the inventiveness and initiative of the spinning, weaving, finishing and merchanting firms making up the co-ordinated enterprise. This might be so, but in certain cases the advantages and savings to be secured by co-ordination or amalgamation might be greater than the disadvantages restricting the initiative of the individual firms making up the joint enterprise. In this connection it must not be forgotten that it is the skill and enterprise of the various sections of the trade as now constituted which has gained for

Lancashire its world-wide reputation as a producer of quality goods. Hitherto, Lancashire mill men have been intensely individualists, but hard facts, the experience of control during the war years, and the depression immediately preceding the war, have demonstrated the value of joint action and policy over a wide sphere and while, in my view, it would be wise to leave very ample scope for the development of private enterprise and individual initiative in the various sections of the industry, Government and the controlling organizations of the trade could with advantage encourage and assist co-ordination of production and amalgamations amongst spinners, weavers, finishers and merchanting houses in the many cases where co-ordination or amalgamation would demonstrably assist the modernization and efficiency of the comprehensive entity.

(3) " A thoroughgoing reform of the labour arrangements. They must act with faith in each other and in the future of the industry. Only so can they succeed."

Volumes might be written on this aspect of the problem but this is hardly the place or the time. What is certain is that without effective assistance from the workers and their organizations, and a complete re-orientation of their attitudes to shift-working, simplified methods of remuneration, rationalization, etc., the achievement of substantial results in the direction of reduction of costs of manufacture will be impossible. As with Lancashire, so with India. Labour and capital are both vitally interested in making any industry a truly great economic asset to the country and the old policy of antagonism and unilateral action must be substituted by policies of co-operation and consultation when important questions of internal economy arise.

(4) " The development of new relationships between production and distribution. What he wished to see was a great extension of the methods of close tie-ups between producer firms and distributor firms."

With all due deference to Sir Raymond, I would say that he was being very kind to the distributors, many of whose present activities should logically devolve on the producers. With spinning, weaving, printing and finishing generally carried on as though they were separate industries instead of integral parts of the general process of cloth manufacture, and with a multiplicity of very small units operating in the weaving and finishing trades, the way has been left open for the creation of a host of unnecessary and expensive intermediaries who will probably continue to exist until the wisdom of co-ordinated activity or voluntary amalgamation of suitable units has become more fully appreciated.

Tax Relief for Cotton Industry

(5) " The Government must act courageously on the doctrine that the re-equipment and modernization of industry, which they so much desire, can only be forthcoming in practice from profits. New capital will not appear unless it can see some prospects of being rewarded out of profits."

Sir Raymond went on to say that Lancashire firms are ready and willing, indeed anxious to re-equip and modernize, but the proposition is just unworkable unless modifications in taxation policy and price control are introduced. The Government must decide if re-equipment and modernization are in the national interest and act accordingly.

There are, in my view, indications that the British Government does realize some of its obligations in this regard and it seems possible that, in the near future, industry generally may receive legislative reassurance in the matter of the promised 20 per cent. refund of E.P.T. for post-war rehabilitation of plant, and that a concession will be made in respect of income-tax liability from profits expended on re-equipment. Concessions such as I have just indicated go only part of the way and something much more generous, helpful and permanent in the matter of reduction of profits taxation will be necessary to achieve effective results in the task of modernizing the Lancashire industry. India is perhaps better placed than Lancashire in this matter of profits taxation, but it would be at least pertinent to inquire whether any definite reassurances have, as yet, been elicited from the Government of India on the very vital issues of the general level of profits taxation, the refund of payments by industry to what I might call the special "rehabilitation" fund, and depreciation allowances after the cessation of hostilities.*

What I should like to see in addition to a fairer basis of profits taxation, by which I mean a permanently lower basis of taxation and a more generous scale of depreciation allowances, would be the delegation of authority to a representative but small committee of the industry to approve and sanction expenditure by individual firms on schemes of plant renewal or modernization to the full extent of the amounts paid by them into the "rehabilitation fund," supplemented where necessary from other reserves or even new capital. I mention new capital for the reason that there is little doubt that for many years to come machinery, raw materials, labour and all overheads will cost considerably more than in pre-war years. The result will be that what constituted adequate provision for paid-up and working capital in the past will no longer be adequate in the future. It must also be remembered that even where a company or firm has fully depreciated its existing plant the funds available by reason of such depreciation would by no means cover the cost of the replacement machinery required and that adequate additional funds out of profits do not exist because they have been swallowed up in E.P.T. payments.

[*We have since received the following further note on this topic from Mr. Maloney.*—ED.]

The Chancellor of the Exchequer in England has recently introduced an Income Tax Amending Bill designed to assist the modernization and re-equipment of buildings, plant and machinery. The major concessions incorporated in the Bill as far as industrialists are concerned are, firstly, the initial allowance of 10 per cent. of the cost of new buildings and the annual depreciation allowance of 2 per cent., and, secondly, the initial allowance of 20 per cent. of the cost of new plant and machinery and an increase in the annual allowance.

As stated in the London *Times*, "the new arrangements for taxation of machinery do not really represent a net saving to industry since the outstanding balance of cost has always been chargeable to obsolescence allowance at the time of scrapping or replacing, but in cases where savings from retained profits are available industry will receive a substantial immediate gain by receiving the allowance at the beginning of the life of the machinery instead of at the end and thus be assisted to shoulder the burden of financing new plant at the end of the war." The *Times*, however, points out that even where liquid reserves are available they will be related to 1939 machinery price levels and not to the greatly enhanced machinery prices of to-day.

The new allowances in respect of buildings are a clearer gain because obsolescence allowances have not been generally obtainable in respect of buildings and as such they are very welcome.

The assistance which the Lancashire mill industry will derive from the new income-tax reliefs will in my view have practically no effect on the industry's capacity to achieve rapid post-war re-equipment. What is really needed is a reduction in the rate of E.P.T. which, if not realized soon, will mean that the bulk of immediate future profits which can be expected, taking into consideration the war position, will go into Government coffers. All that the mills can count on just now towards re-equipment is the depreciation which they have been able to set aside during the war years and the 10 per cent. refund they may expect to obtain at some future date from the rehabilitation fund. This money will be totally inadequate to meet the cost of anything like complete re-equipment with machinery prices likely to remain at something like twice the immediate pre-war levels.

Still one must recognize that some concessions in taxation have been achieved and if there were a guarantee that E.P.T. would be reduced or removed when the war with Germany ends, then Lancashire could look forward more hopefully.

The Chairman of the Cotton Board recently addressed the Liverpool Economic and Statistical Society on the subject of cotton trade needs. The lecture was to my mind somewhat academic in character but it was important inasmuch as it hinted that re-equipment and modernization of the industry would be achieved by the individual action of separate units. The *Manchester Guardian* report referring to Sir Raymond's speech says:—" The total situation," he said, " will never be in the grip of those concerned with any one part of it. That means that nothing the growers can do with their commodity can substantially affect the development of synthetic fibres. It means that capital investment on re-equipment designed to increase production per man-hour has to be considered not merely on a calculation of the consequences upon costs and prices but equally upon such factors as the nature and degree of protective devices likely to be encountered in export markets. It means that plant developments have to be considered not merely in regard to their desirability for the production of the same goods but with an eye on the possibility that the goods themselves may be out-moded by technical and scientific developments."

---

*Please see page 36? for the tax concessions announced by the Finance Member of the Government of India in his latest budget speech.

From all these important considerations he deduced that there was no single policy such as might be adopted by a nationalized industry which could safely be embraced. We should do best to rely upon the variegated reactions of different units in system of free enterprise. The trade catered for an infinite variety of needs and markets and the pressures would manifest themselves in each of its many sections. The nation would be best served, therefore, by a system which resulted in flexibility and an unlimited power of adjustment by separate units.

(6) " Access to markets."

Here, touching on a very tender spot, Sir Raymond stated that Lancashire had no satisfactory indication from the Government as to what it intended after the war concerning commercial agreements with countries overseas and that " some of them " had a worrying fear that this silence was ominous and that trade may be sacrificed to politics. He went on to say that Lancashire must not expect commercial agreements to enable her to sell goods at prices other than those obtainable by the best competitive efficiency, but that, on the other hand, the Government could not expect Lancashire men to sink their money in developing efficiency until they could see at least a fair chance of trading at a profit. India, as the greatest pre-war market for cotton textiles, will definitely be interested in the type of commercial agreement Lancashire wishes to secure, but can hardly object to Lancashire's obtaining a square deal. With Japan out of the way as a source of supply of " bread-and-butter " lines at " crust-and-margarine " prices, there should be room for a substantial volume of cloth imports from Lancashire in special lines, without in any way hindering India from healthily developing her already extensive capacity to manufacture practically all of India's requirements of " essential " cotton goods. Sir Raymond declared, " excepting only Japan with its lower standard of living, it was still a fact that no other producing country could face Lancashire's competition without the protection of stiff tariffs," but in making such a statement he was perhaps rather carried away by his theme, or possibly he was thinking of special lines, for I really doubt whether in ordinary qualities Lancashire has any advantage in production costs over countries like Russia, China, Czecho-Slovakia, Poland and Italy. Naturally, during the next few years, with markets denuded of cotton goods owing to the war, Lancashire's export trade, and India's also, is likely to be extensive, but with prices controlled and profits taxed as they are to-day, little money will remain with manufacturers for modernizing and re-equipment. Such ephemeral prosperity as the immediate heavy post-war demand for cotton goods might create, either in Lancashire or India, would be worse than useless in the long run. No wonder, therefore, that the more far-seeing Lancashire millowners are seeking for assurances in the matter of access to markets on reasonable terms, and for considerable reductions in taxation.

After all is said and done, the Lancashire cotton industry's main hope of permanent future prosperity will largely depend on the extent to which its organization is improved and its plant modernized and renewed, but given an easement of taxation burdens re-equipment and machinery renewal will proceed apace.

Verb. sap. In these matters of organizational improvement and plant renewal, India also cannot afford to be left behind.

Tax Relief for Indian Industry ?

Special Allowances Announced for New Machinery and Industrial Research

Sir Jeremy Raisman's Last Budget

THE following extracts from the Budget speech of the Hon'ble Sir Jeremy Raisman, Finance Member, Government of India, at the latest session of the Central Legislative Assembly will be read with interest as indicating the extent to which Government are willing to afford tax relief to industry for purposes of re-equipment and rehabilitation, as contrasted with the demands that were being repeatedly made by millowners and industrialists in the country.

" In the sphere of direct taxation, it is proposed to continue the excess profits tax at the present rate, together with the scheme of compulsory deposits, for a further year up to the 31st of March, 1946. As regards income-tax, we have given considerable thought to the problems which will shortly arise in regard to the financing of the re-equipment of industry. Our scheme of war-time taxation has throughout been so devised as not to deplete, and on the contrary to strengthen the reserves at the disposal of industry for meeting the calls which will be made upon them in the post-war period. In this respect, we may, without undue sacrifice of modesty, claim to have shown more foresight than we have been given credit for.

" Nevertheless, we are conscious that the restoration and expansion of the machinery of production will call for some new form of assistance, and we feel that we are justified in adapting to Indian conditions the measure of relief which has been announced in the United Kingdom. **This will take the form of the grant of special initial depreciation allowances in respect of new buildings erected, and new plant and machinery installed, after the 31st of March, 1945. These allowances will, in the year in which they are given, be an addition to the usual depreciation allowances, and they will not be deductable in arriving at the written down value. They will not be given for E.P.T. purposes.**

" It is proposed to prescribe these allowances by rule, but I may state here that the figures I have in mind are 20 per cent. on plant and machinery and 10 per cent. on buildings. Allowances at these rates, in addition to the usual rates, should provide substantial encouragement for the early re-equipment of industry.

Scientific Research

" I am also proposing to allow for income-tax purposes expenditure on scientific research. The proposals follow generally the provisions in the U.K. Finance Act of 1944, which have been described by the Chancellor of the Exchequer as ' a comprehensive attempt to relieve from taxation altogether funds devoted by industry to the support of fundamental research, to the translation of laboratory research to production and to the full-scale development of the product.' The proposals, in brief, are the allowance of current research expenditure as it is incurred, the allowance of payments to recognized research bodies and institutions and the allowance over a period of five years or over the life of the assets, if shorter, of research expenditure of a capital nature."

Sterling Balances

Regarding negotiations with the U.K. on the question of the sterling balances, the Finance Member stated that he had had preliminary talks with H.M.'s Treasury officials. These conversations were necessarily directed towards exploring the background for future discussions and the indication of a suitable time-table for more definite negotiations, " since many of the material data were still incomplete and uncertain, particularly the exporting capacity of Great Britain in the immediate post-war years on the one hand and the development requirements and absorbing capacity of India on the other." The vicissitudes of the war in the West have, he said, "disturbed the provisional time-table foreshadowed at these talks and I do not anticipate that any negotiations can be usefully entered upon until after the end of the war with Germany." In view, however, of the " lack of definition at this stage of our own development programme " he did not think that the delay should be prejudicial to India's interests. " Indeed, it may well prove necessary that any negotiations to be carried on," he said, " should in the first instance be of a tentative character and should secure both parties an agreed opportunity for review at a later stage when firmer data may be expected to be available."

Commercial Reaction

The business community, which had expressed concern in the past over India's sterling accumulations, was disappointed at the news that the negotiations regarding the liquidation of sterling balances would not be started with Britain until the end of the war in Europe. It felt that at least a portion of the balances should have been immediately utilized for the importation of more urgent capital goods and essential consumer goods from Britain. It was also considered that the accretion of dollar balances at the rate of 20 million a year was a poor consolation to a country which had put all its eggs in one basket so far. The moderate section, however, was of the view that the Finance Member's statement that the delay in negotiations with His Majesty's Government would not be " prejudicial to India's interests " was sufficiently reassuring.

The relief proposed to be given to industries in respect of depreciation allowance for income-tax was, however, considered to be a half-hearted measure. Sir Akbar Hydari himself recognized the other day that the present multiple shift working involved heavy strain on machinery and that due consideration would have to be given to the problem of making satisfactory provision in respect of depreciation rates to cover the greater wear and tear and so to make possible rehabilitation after the war. The rates of depreciation allowance now laid down may be all right for single-shift working, but are inadequate for additional shifts; at present the depreciation allowances for an extra shift are restricted to a maximum of 50 per cent. of the normal allowance, which, it is feared, is absolutely inadequate to cover the abnormal depreciation resulting from the machinery's being "worked to death" on war and other orders. The suggestion of the Millowners' Association, Bombay, was for the continuation of the existing rates for single shift of 9 hours, doubling the existing rate for double-shift working not exceeding 18 hours in all and 2½ times the present single-shift rate for treble-shift working exceeding 18 hours.

Depreciation allowances, further, should be based on replacement costs, and not as now on written-down values, which, it is universally admitted, bear no relation whatsoever to replacement costs. The special depreciation allowance urged should not, it is pointed out, be deducted from the written-down values, so that the annual depreciation allowance in subsequent years might not be adversely affected.

In view of the foregoing representations, the Government of India appointed a committee, consisting of Sir John Sheehy (Chairman), Mr. C. W. Ayers, Sir Frederick Stones, Mr. M. K. Vellodi, Mr. D. M. Passmore and Mr. J. B. Greaves, to determine whether the textile industry was justified in asking for an increased rate of depreciation.

The Indian cotton mill industry wanted some form of financial assistance from the E.P.T. collected by Government to compensate the high prices which may have to be paid on replacements and renewals in the post-war period. They desired that the expenditure incurred in re-converting the industry to the post-war footing should be allowed as expenditure and adjusted in the last E.P.T. assessment if such conversion took place within a specified period after the termination of the war or the removal of the E.P. tax, whichever was later—Government have agreed to it if the reconversion took place in the E.P. tax chargeable amounting period, otherwise, they say, the matter will have to be considered in conjunction with other circumstances. Further, where a mill had set aside a special sum for repairs and renewals, that should be allowed as a deduction for the purposes of the E.P. tax. The relief, it is claimed, should be liberal enough to allow the industry the cost of putting in the genuine spare parts. The relief at present extended to building, plant and machinery which had been provided as part of the war effort and which are to be scrapped should, it is urged, be extended to cover any loss in value even in cases where equipment might continue to be in use. Moreover, if the valuation of stocks taken for the purpose of assessment of E.P. tax in its last year was not realized within a reasonable time then the assessee should be allowed to reopen the last E.P. tax assessment with a view to setting off the losses arising from the drop in valuation. This permission to reopen assessment should be extended also to cases where an assessee proves within a reasonable time that when he closed the accounts he did not have sufficient information at his disposal to ascertain the exact loss.

The Finance Member's contention that the tax system is calculated to ensure that the financial reserves of industry are not depleted is vehemently disputed by commercial and industrial circles generally, while a suggestion was made in the Assembly that the new depreciation allowance must take effect, not from 31st March 1945 as is proposed, but from 31st March 1944. As regards the relief given in respect of expenditure on research, it is felt that the allowance must be permanent and not limited to five years, that no narrow interpretation should be placed on what research is related to a particular industry and what not so related, and that Government should not be the final judges of what is legitimate expenditure under this head.

Workmen's Compensation Act

By G. R. DESAI, M.A.

(*Specially Contributed*)

BY this article the writer does not intend to criticise the Act; he, however, feels that the Act is imperfect. The preamble reads " Whereas it is expedient to provide for the payment by certain classes of employers to their workmen of compensation for injury by accident it is hereby enacted as follows:— " The word compensation is defined by the Act as 'Compensation means compensation as provided for by this Act.' " In absence of definition of compensation the common meaning of the word compensation, namely, 'recompense' has to be accepted. The Act deals with the computation of the compensation amount. The Act also sets out the upper limit of the compensation amount but does not say anything as to why it sets out a limit on the extent of the compensation amount.

There are two main points at issue, namely:—(1) The compensation awarded to a workman following a disablement is a lump sum. This lump sum is the same for all workmen irrespective of their ages if their wages are equal and if the extent of the disablement they incur is the same. Thus a worker aged 20 or 30 or 50 will be awarded a fixed amount, say, Rs. RW where R is the compensation amount per unit wage and W is the wage of the worker.

(2) The compensation amount to be awarded is made to depend on the wage earned by a workman and wage has been defined by an omnibus definition by 2(*m*) of the Act as under:— " Wages includes any privilege or benefit which is capable of being estimated in money other than a travelling allowance or the value of any travelling concession or a contribution paid by the employer of a workman towards any pension or provident fund or a sum paid to a workman to cover any special expenses entailed on him by the nature of his employment."

This omnibus definition of wages besides the normal wages includes tea, tiffin, grains, uniform, *sukhadi*, *bucksheesh*, bonus, dearness allowance and any other circumstantial relief, all of which are being capable of being estimated in money and all of which can be construed to be regarded as privilege or benefit. This definition of wages, therefore, differs from one given under the Payment of Wages Act whereas both the Acts apply in many cases to the same factory or institution or employer. These definitions cannot be reconciled with each other and for purposes of both Acts the amounts of wages of the same workmen will be different from each other. The Excess Profit Tax Draft Rules give also definition of wages which is quite different from these definitions. There should be uniform definition for different Acts passed by the Legislature.

The computation of compensation falls under two main categories: Accident resulting in death or resulting in permanent total disablement. In 1923 the compensation for both of these is set out to be equal to 30 months and 42 months wage respectively of the workman who is a victim of the accident. Schedule IV of the 1923 Act gives adjustment in wages of the workman. The Amended Act of 1934 gives computation of compensation for these by Schedule IV where for wages from 0 to 18 compensation amount is higher than that equivalent to 30 months or 42 months' wages, but higher the wages the position taken up in 1923 for computing compensation is accepted in principle. In case of death the compensation to the beneficiaries of the workman meeting death due to accident is small and accords only a temporary relief. In case of permanent total disablement the workman and his dependent are also accorded relief for a limited period not exceeding 3½ years. For permanent damage the Act provides for temporary relief which does not cover even the ordinary meaning of compensation. The Act must provide for compensation commensurate with damage.

The workman's retiring age in India should be 55, for thereafter, for all manual purposes, the infirmities which old age brings with it render the workman less efficient. A workman not incurring a permanent total disablement would work till the retiring age and earn his wages but in the event of his incurring a permanent total disablement he is prevented from earning his wages for the rest of his life, i.e., if he is of 23 years, for the 32 years he would have earned his wages if the event did not happen, but the Act provides for compensation amount which would enable him for only 3½ years instead of 32 years to maintain him. For the rest of his life there is a blank for him. It will therefore be no justice to the workman if compensation amount is not made to depend on age. The present limit set out for compensation amount is quite inadequate. The amount must be higher and must vary with the age of the workman. The wage as defined by the Act does not represent the intrinsic earning capacity of the workman. It combines intrinsic as well as circumstantial earning capacity of the workman. This is not so in life. The dearness allowance for example, is a temporary measure of relief. It has nothing to do with the intrinsic earning capacity of the workman or as a matter of fact of an employee. An employee whose salary is, say, Rs. 200 has earned by a stroke of luck Rs. 10,000 on the stock exchange. This does not change the intrinsic earning capacity of the employee. As for dearness allowance or some such circumstantial relief (on account of famine in a particular area which is the scene of employment or some such cause) it being same for all employees does not represent the intrinsic earning capacity of the workman. The points set out below deserve to be considered:–

(1) The present compensation amount is inadequate.

(2) The compensation amount must be made to depend on the age of the workman.

(3) The compensation amount must be made to depend on the intrinsic earning capacity of the workman.

(4) If compensation amount is sought to be paid for the circumstantial earning capacity of a workman it must be made to depend on expected duration over which the circumstantial relief will be continued to be accorded and should be in proportion, the factor of proportionality being the ratio of the expected duration over which the circumstantial relief spreads to that of the length of period over which the permanent total disablement lasts (taking 55 years of age as retiring age).

(5) The compensation amount should not be paid in a lump sum but be paid in monthly instalments as the latter mode will not defeat the purpose of the Act. There is always a danger of the lump sum being misused and squandered away or being paid away to defray existing debts.

(6) All amounts of compensation as a result of death or permanent total disablement must be lodged with the Commissioner irrespective of any agreement arrived at between the employer and the person under a legal disability or the beneficiary or beneficiaries of the deceased workman.

(7) The employer or the insurance company with whom the employer has taken out an insurance policy under the Workmen's Compensation Insurance Scheme must lodge with the Commissioner the compensation amount in lump sum as soon as the claim of the claimant is entertained and the Commissioner must forthwith invest the sum so received reproductively for the purpose of paying the compensation amount in instalments to the claimant who may be the person himself under a legal disability or the beneficiary or beneficiaries of the deceased workman. It is proposed to enter upon mathematical details of computation of compensation amount in what follows:—

Let C be the lump sum amount of compensation per unit wage per annum of the workman to be awarded to the claimant. This C will be different for different ages of the workman incurring a legal disability. For all purposes a legal disability is taken to mean permanent total disablement in what follows, as compensation corresponding to death or permanent partial disablement can be derived, as shown hereafter, from C when C is computed.

Consider a person aged A under a legal disability. Then compensation per unit wage per annum to be awarded to him will be C_A. Let his normal wages be p per annum and let q represent his annual circumstantial earning. Under the existing definition of wages in the Workmen's Compensation Act the compensation amount will be $(p+q)\ C_A$, but as the circumstantial earning may or may not be earned by him for the remaining 55-A years of his life, he need not be given qC_A amount of compensation corresponding to this part of earning. It will have to be assumed that x years will be the duration during which the workman will receive the circumstantial wage. The compensation amount in this case, therefore, must be in proportion. The compensation amount must therefore be

$$pC_A + q.\frac{x}{55\text{-}A}C_A$$

$$=\left(p+\frac{q\,x}{55\text{-}A}\right)C_A$$

The distinction pointed out here will be lost when $x = 55\text{-}A$. Corresponding to the circumstantial wage the smaller will be the compensation amount the smaller the A is because $\frac{x}{55\text{-}A}$ decreases as A decreases. Having settled the amount of compensation for circumstantial wage it is proposed to settle the value of C_A. The present compensation amount per unit wage per annum is inadequate and is not dependent on age. For the purpose of computation of compensation it is assumed that the unit wage per annum is paid at the end of the year and that for convenience the unit wage is paid in 12 monthly instalments each $=1/12$. The present value of unit will therefore be calculated at an assumed nominal rate of interest. If the accident did not take place the workman aged A is supposed to have continuously served and earned the average wage per annum which he had earned during the one year prior to the happening of the accident. Therefore the compensation per unit wage per annum will be the present value of an immediate annuity—certain of unity for 55-A years at a certain assumed rate of interest and symbolically it is $a_{\overline{55\text{-}A}|}$. It is assumed that the nominal rate of interest (which is supposed to be equal to effective rate of interest) is 6 per cent.

$$\therefore\ C_A = a_{\overline{55\text{-}A}|} \text{ at 6 per cent.}$$

The compensation amount C_A per unit wage per annum must be lodged with the Commissioner. This lump sum amount is to be invested reproductively by the Commissioner and the claimant is to be paid back 55-A yearly instalments each $=\frac{C_A}{55\text{-}A}$. This means that the lump sum so received is not invested reproductively and yet it will leave a big margin of reserve as the lump sum so received is bound to be invested reproductively at a certain rate of interest. The margin of reserve in this case per unit wage per annum when 55-A instalments each equal to $\frac{C_A}{55\text{-}A}$ are paid off will be $=C_A\left(1+i\right)^{55\text{-}A}-\frac{C_A}{55\text{-}A}\,S_{\overline{55\text{-}A}|}$ the assumption being that instalments are paid yearly and that C_A is invested at a certain rate of interest. If it is invested in $3\frac{1}{2}$ per cent. Government paper and if $A = 29$ then $C_A = 13.0032$

$$(1+i)^{55\text{-}A} = (1+i)^{26} = 2.44596$$

$$S_{\overline{55\text{-}A}|} = S_{\overline{26}|} = 41.3131$$

and the margin

$$= C_A\left[\left(1+i\right)^{55\text{-}A} - \frac{1}{55\text{-}A}\,S_{\overline{55\text{-}A}|}\right]$$

$$= 13.0032\ \left[2.44596-\frac{1}{26}.41.3131\right]$$

$$= 11 \text{ to the nearest integer.}$$

The payment of compensation amount by instalments, the claiming of the compensation amount from the employer in a lump sum and details and routine will require a bigger staff involving recurring annual expenses and these can be easily offset against the margin leaving still a substantial margin. The margin so accumulated and summed up will develop into a huge reserve fund which may be successfully utilised in improving living conditions of workmen.

As an illustration let us find the yearly instalment of compensation amount to be paid to the person aged 29 incurring a permanent total disablement whose monthly normal wage is 25 and whose circumstantial monthly wage is 52. Assume that the duration over which the circumstantial wage earning lasts is five years.

The yearly instalment is

$$= \left[\ p\,C_A + q\,\frac{x\,C_A}{55\text{-}A}\ \right] \Big/ (55\text{-}A)$$

$$= \left[\ p + \frac{q\,x}{55\text{-}A}\right]\frac{C_A}{55\text{-}A}$$

$$= \frac{13.0032}{26}\left[\ 12\times25+\frac{12\times52\times5}{26}\right]$$

$$= 150 + 60 \text{ roughly} = 210 \text{ roughly.}$$

For the sake of facility, if monthly instalment is paid the person under legal disability will receive Rs. 17-8 every month till retirement or death, whichever is earlier.

Under special circumstances, if the claimant requires a lump sum an application should be made to the Commissioner and if the Commissioner is of the opinion that a certain lump sum need be paid to the claimant, one-third of the annuity may be commuted and if the application is made B years after the happening of the accident the commuted amount per unit wage per annum will be $=\frac{1}{3} C_A \, a_{55-A-B}$ at 3½ per cent. and the yearly instalments will reduce to $\frac{2}{3}$ C_A per unit wage per annum.

The compensation amount for death corresponding to C_A the compensation amount for permanent total disablement is

$$\theta C_A \text{ where } O<\theta<1$$

The value of θ as computed in the present Act is $\frac{30}{42}=\frac{5}{7}$.

To evaluate compensation amount for permanent partial disablement corresponding to C_A one has only to make reference to Schedule I. If Y represents the loss percentum of earning capacity corresponding to C_A then the compensation amount is YC_A.

The older the workman is, the higher should be his earning capacity. In the foregoing discussion this fact is not taken into consideration for unfortunately the wage scale for workmen everywhere has not been fixed, but, considering the progress the world is making in this direction, the day is not far distant when unequivocally defined wage-scale assuring normal living to workmen will come into being. It is then easy to make a corresponding revision.

If the amount of compensation to be awarded be revised and fixed as is provided for herein there will be a corresponding change in the amount of premium to be paid by an employer to the insurance company. Thus let P be the amount of premium to be paid for unit wage per annum. Let EK represent the total number of workmen aged K and let E be the total of all workmen so that $E=E16+E17+\dots+E55$. Let q be the circumstantial wage of each workman—assumed to be the same for all so that if Q be the total of circumstantial wage of all workmen then

$$\begin{aligned} Q&=(E_{16}+E_{17}+\dots\dots+E_{55})q \\ &=qE \end{aligned}$$

Let D be the average age of the workman so that

$$D=\frac{16.E16+17.E17+55.E55}{E}$$

The total premium the employer will have to pay is

$$=P\left(N+\frac{x}{55-D}Q\right)$$

Where N is the total of normal wages.

The more statistically true way of defining D will be as under :—

$$\frac{x}{55-D}\times C_{55-D}\,Q=\Big[\frac{C_{16}}{55-16}.E_{16}+\frac{C_{17}}{55-17}E_{17}+ + \frac{C_K}{55-K}.E_K+\dots+\frac{C_{55-x-1}}{55-x-1}E_{55-x-1}+ \left(E_{55-x}+E_{55-x+1}+\dots+E_{55}\right)\frac{C_{55-x}}{55-x}\Big]xq.$$

The last term in the bracket signifies that all workmen aged 55-x and above will each get compensation corresponding to circumstantial wage per unit per annum $=\frac{x}{55-x}.C_{55-x}$

Though there is a difference in the two values of D it is advised that the former value, which is easier to compute, be taken.

◆

"Comfortable" Colours for Interiors of Mills

WHAT suitable paint in harmonious colours can do in transforming the appearance of the interior of mills was shown by the Cotton Board in an exhibition in Manchester. For example, the ends of many machines look better with a coating of paint. The section devoted to the latest lighting methods was particularly interesting to management and work-people alike. The importance of preventing eye strain in every way possible is obviously a duty that rests on those responsible for the management of mills. Illustrations were shown of the best ways of lighting rooms so that the operatives can work in comfort.

Central Legislative Assembly Discusses Cloth Control

Passes Cut Motion by Majority

MR. A. C. Datta moved in the Central Legislative Assembly on Monday the 12th March 1945 that the demand under the head "Department of Industries and Civil Supplies" be reduced by Rs. 100 to discuss the cloth and yarn position.

He said that the shortage of yarn and cloth in the country in general and Bengal in particular had become acute. The quota allotted to Bengal was about one-half of the quota given to other provinces. It was reported, he stated, that some women in Bengal had to go almost naked for want of *saris* and committed suicide. *Dhotis* and *saris* were not available in Calcutta. It was also reported that shrouds of the dead were removed from the burning ghats and sold in the market. Bengal's Ministers were going to the villages to preach the use of *khadi* and he hoped that members of the Central Government would follow suit.

Nawab Siddiqali Khan (Muslim League) referred to Sir Azizul Haque's assurance to set up a handloom weavers' board and asked how long it would take for the heavy Government machinery to move in that direction.

Mr. Sami Venkatachalam Chetty (Congress) said that the confusing and contradictory orders issued by the Textile Department itself resulted in the cloth not reaching the consumer. Madras dealers were asked, for instance, to buy from Bombay, but no permits were issued for export of cloth from Bombay to Madras for several days.

The Government did not make any attempt to organize handloom weavers, continued Mr. Chetty, and weavers who used only fine yarn were not supplied with fine yarn.

Smuggling to China

Sir Vithal Chandavarkar (Bombay Millowners' Association), referring to the shortage of yarn and cloth in Bengal in particular, said that Bengal had actually been given 179,000 bales against an allotted quota of 150,000 bales to that province. The shortage of cloth in that province, Sir Vithal thought, must be due to increased smuggling into China, where it was sold at anything up to Rs. 10 per yard. Until recently there was no ban on exports to Tibet and he was told that a lot of cloth had found its way into China via Tibet.

To make the various control orders effective and for equitable distribution of stocks, Sir Vithal suggested that the Provincial Controllers should be under the direction and supervision of the Textile Commissioner. If the Government could remove constitutional difficulties in regard to the Estates Duty Bill surely they could also remove such difficulties for the smooth working of the textile control machinery.

Sir Vithal refuted the charge that the Textile Control Board was dominated by millowners. The Distribution Committee of the Board had only three or four members representing the industry. He asserted that the scheme for distribution had not been prepared by the Board but by the Government of India.

The industry, Sir Vithal declared, was anxious, first, to meet the needs of domestic consumers; but the Government for political reasons, wanted textiles to be exported to certain Middle East countries where there were no price controls and where the respective Governments made as much as 75 per cent. profit over cloth purchased at controlled rates from India.

The shortage of yarn, in his opinion, was due to hoarding of yarn by master weavers.

Cloth Situation

Sir Azizul Haque, the Commerce Member, said that the handloom weavers in the country had for years a miserable existence. He was responsible for the decision that their production should not be texmarked, and it would be a gain to the country if they were able to rehabilitate themselves by taking advantage of the present war conditions. There was now an overall shortage of yarn in the country, and the shortage was more keenly felt in Bengal because the industry was not developed there. Bengal was the largest consuming centre in the country, but it produced the least quantity of textiles. However, handloom production had increased by 60 per cent. compared to 1935-36. The Commerce Member said that there was practically no export of fine yarn from the country. Most of the fine yarn produced was consumed by the mills themselves, and whatever was left over was given to the handloom weavers. The Government were concerned with the total output of textiles rather than how they were produced.

Sir Azizul Haque said that the pre-war consumption of cloth was about ten yards per head, but the Government were able to supply more than ten yards for the provinces. During the last seven months, they were able to give Bombay 13.9 yards per head. He explained the recently introduced system of licensing wholesale dealers in regard to distribution, and said that to-day there was not a single yard of cloth which left the mill which was not stamped with the wholesale and retail price and the date within which it should be disposed off. It was a big task stamping over 5,000 million yards of cloth divided into thousands of varieties, and members should not be guided by isolated cases of malpractice. The Government would not hesitate to take firm action against hoarding and profiteering.

In regard to cloth rationing, the Commerce Member said that the question presented extraordinary difficulties. It was not possible to have uniformity of cloth for distribution. He was, however, investigating the matter.

Semi-Defence Services

Mr. K. C. Neogy (Nationalist) said that the requirements of certain semi-defence services, such as the A.R.P. and the Red Cross, and hospital requirements were not met out of the 900 million yards allocated for the defence services, but out of the quota allotted for civilian consumption. He asked what was the Government's policy in regard to exports. The Commerce Member had stated that practically no yarn was exported. It was immaterial whether the exports were of yarn or cloth. They knew the Government were exporting 6,000 million yards of cloth. The Export Committee of the Textile Control Board had suggested that the Government should reduce the exports.

Mr. Neogy said that in the matter of coal supply, preference had been given to the jute industry, while about 48 million yards of cloth were lost to the country this year owing to lack of coal supply to the textile mills.

In regard to the *per capita* consumption of cloth, Mr. Neogy referred to the report of the Fact Finding Committee of the handloom industry, and said that in 1938-39 it was stated that the consumption was 15.4 net yards and he did not know where the Commerce Member got his figure. Apart from devising a new scheme for distribution and leaving it to be administered by the provinces, he asked whether the Textile Commissioner would have any actual supervisory authority over the provincial agencies. The central control, he said, should be real and not illusory.

The cut motion was pressed to a division and was passed by 58 votes to 45.

PROFITEERING AND HOARDING IN BENGAL

Questions Raised in Provincial Assembly

AN exciting two-hour debate took place in the Bengal Legislative Assembly on 22nd February 1945 on an adjournment motion moved by the Opposition to discuss "the failure of the Government to prevent the acute and unprecedented cloth famine that has overtaken the province at the present moment." The motion was rejected by 104 to 65 votes.

Mr. Atul Chandra Sen (Unofficial Congress), who moved the motion, characterized the cloth famine as "devastating." In his own district (Dacca) he had known men spending months with tattered rags tied round their bodies. He had also known cases of women not being able to come out of doors, having practically no cloth to cover themselves. He thought that the famine could have been averted by the Bengal Government to some extent. What was necessary was to point out to the Central Government the injustice that had been done to Bengal by allotting only 10 yards *per capita* while other provinces had got a much higher quota and sincerely to try for an equitable distribution of supply through some sort of rationing and prevent a portion of it from going into the black market.

Mr. Patiram Roy (Scheduled Castes) said that there had been cases of suicide by women on their being unable to cover themselves for want of cloth.

Dr. Nalinaksha Sanyal (Official Congress) said that in the matter of distribution of cloth, which was the primary responsibility of the Provincial Government, not only had the Provincial Government failed in the discharge of their duties in these respects, but they had also set up a machinery which was corrupt from top to bottom and which should be scrapped. Black markets, he alleged, were freely going on in almost every sphere of textiles in which some of the Government officials were also involved.

Replying to the debate, Mr. H. S. Suhrawardy, Minister for Civil Supplies, admitted that there was a cloth famine in the province, but that was very largely due to the inadequate supply. The quota allotted to Bengal was very low: he had vigorously protested against that, and if justice was not done to Bengal in this regard, the province was in for a very bad time indeed.

New Cloth Scheme

The Central Textile Board was proposing a new scheme which envisaged the freezing of cloth from the beginning and then controlling distribution. When the new scheme would come into operation the Government, he said, would be in a position by controlling the quota-holders to distribute whatever cloth they had got on an equitable basis. Under the new scheme, the Minister was almost certain they would be in a position to regulate the distribution of cloth much better than before.

The position taken up by the Central Government regarding the allocation of cloth to Bengal was indefensible. He intended, as far as possible, to explore all possibilities of the rationing of cloth, but did not know if they would succeed or how long it might take to enforce it. But in the present limited supply, Mr. Suhrawardy maintained, they would be able to give only one pair of *dhotis* or *saris* per adult, which was hopelessly inadequate.

Referring to the "acute" shortage of cloth in the city and mofussil in the Calcutta Municipal Corporation, Mr. H. K. Ganguly said that people were not getting any cloth in the open market, while there were tons of cloth in the black market, which, he said, was flourishing in every field of textiles. He added that cloth from bodies taken to the burning ghat was being sold in the market straightaway. In the interest of the health of the city such practices should be stopped, he said.

The Mayor said that the Chief Executive Officer would take action in the matter.

Sensation in Bombay—Official Reactions

The report about cloth famine in Bengal has created a sensation in Bombay. Well-informed circles believe that the trouble is almost entirely due to the lack of effective control over distribution.

It is pointed out that hoarding and profiteering in cloth has been rampant in Bengal. Cloth is being increasingly smuggled to China where Indian cloth is being sold at the fancy rate of Rs. 10 per yard. Until recently, there was no ban on exports of cloth to Tibet with the result that large consignments of Indian piecegoods found their way from Kalimpong to Tibet on mules and yak resulting in a depletion of the stocks meant for Bengal.

In Calcutta, which is the main distributing centre, black markets are stated to be flourishing. Besides the usual method of receiving an excess value in advance and delivering the cloth on payment of the control price, the trade has adopted other ingenious methods. It is stated that business houses engaged in the dyeing and printing of cloth have multiplied by nearly five times during the past three years because they provide a useful channel of evading the price control over cloth. Another well-known method of evasion is to sell only ready-made garments.

All this is believed to be due to lack of effective control on the part of the Provincial Government. A Bengali business man in Bombay told a Press representative that Bengal had no Textile Controller until a year ago and even to-day his staff was insufficient to cope with the work of supervision. Charges of corruption were also not being infrequently made. According to his information, there was no special branch of the C.I.D. to enforce the control orders until May last, and the number of prosecutions in 1944 was very small as compared with the size of the province, the extent of black marketing and the action taken in other provinces.

Excess Supply

Inquiries in authoritative circles show that since Assam was constituted an independent unit of the Bengal deficit zone, the province of Bengal was entitled to receive during the seven months ended January last 120,050 bales of cloth, while it actually received about 179,034 bales, representing an excess supply of 58,984 bales of cloth over the actual quota to which the province was entitled. Besides, Bengal is allowed to retain its own production of about 20,000 bales per month.

As regards the criticism that the rate of 10 yards per head per annum is inadequate for Bengal and certain other provinces, it is pointed out that the normal consumption of cloth in India during the pre-war days used to be only about 16 yards per head per annum. With the mills now producing their maximum, only about 4,800 million yards of cloth is available for civilian consumption. This figure includes handloom production, but does not take into account woollen cloth. Therefore, on the basis of the population, according to the 1941 census, not more than 12 yards per head per annum can be had for distribution all over the country.

Rates of Consumption

It must be admitted, it is argued, that the rates of consumption of cloth differ in different provinces. Taking this factor into consideration, the Government have decided to rationalize the sacrifice of consumers in each province and not ration cloth. For example, where Punjab normally consumed 22 yards of cloth per head a year, the province now gets a quota on the basis of 18 yards per head: Bombay receives 18 yards instead of about 25: and Bengal ten yards instead of 11½ or 12. The sacrifice has thus been as equitably distributed as possible among the various consumers in different provinces.

The allotment and the basis of the quota per head does not necessarily mean that the purchase by each individual will be restricted to that quantity. It means that the total allotment for a province is on the basis of so much per head. In calculating the total quota for a province, children, servants, working class, villagers, all have been taken into consideration, the majority of whom have never been known to consume as much cloth, as has been allotted per head. Therefore, it is argued that there is no justification whatever for a few moneyed people to rush and hoard cloth, thus preventing other consumers from getting their normal requirements.

Cloth to be Rationed in Bengal

Mr. H. S. Suhrawardy, Minister for Civil Supplies, Bengal, indicated at a Press Conference that full-fledged rationing of cloth would be in operation throughout the province in about six weeks.

Attributing the present acute shortage of cloth in Bengal chiefly to the " vacillating policy of the Government of India " in relation to the textile interests, he said that towards the end of August 1944 he attempted to adopt the policy of freezing all cloth coming into Bengal and distributing it throughout the province. He did so even though there was no assurance of supplies.

But the representatives of the Government of India came to Bengal at about that time and, in spite of his assurance that there was no way out but complete control by Government, stated that the normal trade channel must be utilized and the trade must be given a further chance to distribute cloth. He had thus to abandon his scheme.

The Bengal Provincial Textile Control Advisory Board adopted a resolution recently recommending to the Government of Bengal to take immediate steps for possession of all kinds of cotton piecegoods and make arrangements for their distribution throughout the province on a rationed basis.

Black Markets in Textile Trade to go

The Bombay Cotton Cloth Trade Regulation Order, 1945

THE Bombay Cotton Cloth Trade Regulation Order, 1945, came into force in Bombay City, Bombay Suburban District and Ahmedabad City and suburbs from 1st March. A notification bringing the Order into force in these areas was published in the *Bombay Government Gazette*, Part I (Extraordinary), dated 23rd February.

The Order will be extended to other parts of the Province in due course. Meanwhile the existing Bombay Cotton Cloth Dealers Licensing Order, 1943, will continue to operate in those parts. Licences already issued under that Order will continue to be valid.

In Bombay City and Ahmedabad, licences already granted under the old Licensing Order will remain in force in the case of persons who apply for licences under the new Order within one month after 1st March until a licence under the new Order is issued or the applicant is informed that a licence cannot be granted to him. Dealers should, therefore, apply in good time for licences on the prescribed application form, which can be obtained from the office of the Provincial Textile Controller in Bombay City and from the office of the Assistant Textile Controller at Ahmedabad.

After the introduction and the necessary definitions, the Order proceeds to lay down:

Save as hereinafter provided no dealer shall sell, or store for sale, cloth except under and in accordance with the conditions of a licence granted by the licensing authority.

(*a*) For the purposes of this Order there shall be six classes of dealers, viz.:—

(i) " A class dealer," meaning a dealer who buys cloth from a manufacturer in mill-packed bales or cases and sells it or stores it for sale in such bales or cases; he shall obtain a licence in Form II.

(ii) " B class dealer," meaning a dealer who buys cloth from a person other than a manufacturer in packed bales and sells it or stores it for sale either in packed bales or split bales; he shall obtain a licence in Form III.

(iii) " C class dealer," meaning a dealer who does retail business and sells or stores cloth for sale to persons other than licensees, he shall obtain a licence in Form IV.

(iv) " D class dealer," meaning one who carries on business in cloth as an agent; he shall obtain a licence in Form V.

(v) " E class dealer," meaning a hawker; he shall obtain a licence in Form VI.

(vi) " F class dealer," meaning a dealer not included in classes A to E; he shall obtain a licence in Form VII.

(*b*) A dealer may at one and the same time belong to one or more of the above six classes if the licensing authority so permits.

Applications for licences under this Order shall be made to the licensing authority in Form I.

The licensing authority may, for reasons to be recorded in writing, refuse to grant a licence.

Notwithstanding anything contained in this Order the Government of Bombay may, without assigning any reason, direct that any application for a licence be refused.

The licensing authority may direct a dealer holding stocks of cloth to supply to specified dealers or persons, specified quantities of cloth at specified rates within a specified time, and may from time to time issue such general or special directions to a dealer with regard to the storage, sale and transport of cloth as it may deem fit.

Every licensee shall, by the 10th day of February, May, August and November, in each year, submit to the licensing authority in Form IX a true and correct statement of stocks of cloth held by him on the last date of the preceding January, April, July and October, respectively.

A " C " class dealer shall display prominently in his place of business a list showing the maximum retail prices in respect of all such kinds of cloth in his shop or store as have prices stamped thereon and shall not on demand and offer of the maximum retail price withhold from sale any such cloth to any person.

An " E " class dealer shall carry a list showing the maximum retail prices of all such kinds of cloth carried or exposed for sale by him, as have prices stamped thereon.

Every dealer other than a hawker shall issue to every customer a correct cash memorandum or credit note, as the case may be, of which he shall keep a duplicate which shall be produced by him for inspection on demand by the licensing authority or any officer authorized by it in this behalf, and which shall contain the following details:—

Name, licence number and address of the dealer; date of transaction; name and address of purchaser; detailed description of goods sold; quantity sold; rate at which sold; unit of sale; total price for each item; and salesman's signature.

The duplicates of cash memoranda and credit notes shall be preserved for one year from the date of issue.

A licensee shall surrender his licence to the licensing authority for cancellation within three months after the date on which he closes his business and at the time of so surrendering the licence declare the stock held by him on the said date.

The licensing authority may, without prejudice to any other action that may be taken against a licensee for supplying incorrect information on his application for the grant or renewal of a licence, or contravention of any of the provisions of this Order, cancel or suspend his licence after such inquiry as it deems necessary.

Notwithstanding anything contained in this Order, the Provincial Government may, without previous notice or assignment of any reasons, cancel or suspend any licence or class of licences and such cancellation or suspension shall not entitle the licensee to any compensation or the refund of any fees paid in respect of any such licence.

The licensing authority may in its discretion cancel a licence under which no business is carried on for more than three months.

The licensing authority or any officer authorized by the Government of Bombay in this behalf may, if such authority or officer has reason to believe that any person has contravened any provision of this Order,—require any person to give any information in his possession in respect of any business carried on by himself or any other person; inspect or cause to be inspected any books or documents, as well as stocks of cloth, belonging to or under the control of any person; enter and search, or authorize any person to enter and search, any premises and seize, or authorize any person to seize, any article in respect of which the authority or officer has reason to believe that a contravention of this Order has been committed.

Under the scheme, there will be " A class " quota-holders who will buy the cloth from the mills and sell it to " B class " quota-holders by charging 3 per cent. commission. The latter, in turn, will be allowed to have a margin of 6 per cent. They will be required to forward particulars of the deliveries to the Provincial Textile Controller who will keep a check on the dealings.

Provincial Controller Explains

Explaining the Bombay Cotton Cloth Trade Regulation Order, which came into force in Bombay City, the Bombay Suburban District and Ahmedabad on 1st March, Mr. Thakore said that it would enable Government to exercise better control over the channels of distribution. Under the Bombay Cotton Cloth Dealers' Licensing Order, 1943, over 46,000 licences had been issued in the province, inclusive of 17,000 in the city alone. Besides the fact that this number was too unwieldy, that order made no distinction between wholesale and retail dealers, and wholesalers could also trade as retailers. The new order remedied this defect by classifying them and providing for separate licences for wholesalers, retailers, commission agents and hawkers. Applications for licences under this order were being received, and certain principles had been laid down for substantially reducing the number of licences with a view to enforcing stricter control. The applications for licences would be thoroughly scrutinized with a view to eliminating one dealer obtaining several licences in his own name or under different names. No licences would be granted to persons found guilty of malpractices.

Trade Criticism

Resolutions protesting against the " excessive " licence fee of Rs. 500 prescribed for commission agents under the Bombay Cotton Cloth Trade Regulation Order and pleading for reducing it to Rs. 25 only have been passed at a conference of the representatives of the Marwadi Chamber of Commerce, Bombay, and six other bodies interested in the trade.

By another resolution, the meeting has pleaded for postponing the enforcement of the Order till 1st July and for exempting the "D" class licensees from the provision of clause 23 of the Order which provides for cancellation of licences of those who do not carry on their business for more than three months.

The Committee of the Indian Merchants' Chamber, Bombay, in the course of a communication to the Secretary to the Government of Bombay, Finance Department, protests against the " defects " and " omissions " in the Bombay Cotton Cloth Trade Regulation Order, 1945. The Committee regrets that before issuing the revised order, Government did not consider it advisable to circulate the draft to the interests concerned for eliciting opinion.

The Committee urges upon the Government that the provisions of clauses 8, 11 and 22 of the Order be amended in accordance with its suggestions. Whether for refusing to grant applications for licences or for suspending or cancelling licences already granted, the Chamber urges that the reasons therefor should be presented in writing and that in either case appeal should lie to the higher authorities. It urges that the proposed scale of fees, too, should undergo a drastic downward revision if the trade is not to be unnecessarily penalized.

Arrangements in Ahmedabad

With effect from the 1st of March, 1945, all cotton cloth has been frozen in the hands of quotaholders in Ahmedabad.

Such cloth will only be permitted to be sold to Deficit Zones in pursuance of purchase authorities granted by the Textile Commissioner, Hararwala Building, Wittet Road, Ballard Estate, Bombay, to merchants who have previously been recommended by the Provincial or State Governments of the Deficit Zones concerned for a specific number of bales in the case of each merchant. No person who is not so recommended by a Provincial or State Government will be issued such authorities under any circumstances.

Merchants holding such purchase authorities will be issued Transport Permits with such authorities and they will be instructed to approach the Maskati and Panchkuva Cloth Merchants' Associations, Ahmedabad, who will arrange the procurement of all the bales covered by such purchase authorities. The Transport Permits will then have to be registered by the consignors, who will either be the seller or a commission agent employed by the holder of the purchase authority, with the Millowners' Association, Ahmedabad for transport. The Millowners' Association, Ahmedabad, will then issue orders regarding the delivery of such goods for transport. The consignor must hold a VALID Bombay Government Cloth Dealers' Licence.

It has been arranged with the two Associations that 2,000 bales will be supplied to the Printers' and Processing Associations in Ahmedabad. But it is a condition of such supply that no person will be allowed to process cloth except for the account of the supplier of the goods and after processing, such cloth must be returned to the same supplier.

With regard to the proportions of the different varieties of cloth that are to be purchased by holders of the purchase authorities for supply to deficit zones, the two Associations have in agreement with the Textile Commissioner laid down the definite proportions that shall be purchased by each permit holder for each zone. Merchants must carry out the directions of the two Associations in regard to this matter subject to modifications between zone and zone to suit each zone's special requirements.

Cloth Rationing in Bombay

Partial rationing of cloth has been introduced in Bombay City and Bombay Suburban District with effect from Wednesday the 21st March 1945. A beginning has been made by rationing *dhotis* and *saris* in which there is at present an acute shortage. Every head of a family will be entitled to get two *dhotis* and two *saris* every half-year against his ration card. The scheme will then be extended to mulls and voiles. Besides the licensed retail shops, it is proposed to increase the number of approved shops to 500.

After a lapse of nearly two months, good quality cloth of Indian mills made its appearance in some of the shops in Bombay City on the 10th March 1945. It is believed, however, that the situation will not ease appreciably until the Bombay Cotton Cloth Trading Regulation Order comes into operation on 1st April.

The Government of Bombay, it is understood, have decided to extend the Order to the whole of the province in order to have a stricter control over the distribution of cloth. It is gathered that at least half the number of cloth traders will be eliminated from the trade, but genuine merchants will not be affected. Steps will be taken to put the distribution of cloth on a more rational basis.

To relieve the cloth shortage in Bombay City the textile control authorities have arranged for the movement of cloth into the market from the quota holders with whom it had been frozen.

In the course of his address at the recent Provincial Cloth Dealers' Conference held in Patna, Mr. Vellodi dealt with the demand for fine cloth which had increased considerably during the recent past. The production of such cloth in this country was very limited, and he had informed the Provincial Governments that they should decide which were the centres that should receive fine cloth so that they might be licensed and one would know where to procure such fine cloth. As regards increased production of *dhotis* and *saris* he had the assurance of the Chairman of the Textile Control Board to say that the price had been recently so revised to make it profitable for the mills to produce more *saris* and *dhotis* than they used to hitherto.

The Commission Agents

All commission agents in Bombay City and Suburban Area taking delivery of or holding goods on behalf of quota-holders situated outside the Bombay Surplus Area are required to declare their holdings to the Textile Commissioner in accordance with the notification of the 16th December 1944, as goods directly purchased from a manufacturer.

All such persons are hereby notified that under no circumstances will transport permits be issued to them to enable such goods to leave Bombay. They must, therefore, sell the goods to holders of authorities issued by the Textile Commissioner at a price not exceeding the ex-mill price plus 3 per cent. Any failure to sell such goods to the holders of such authorities will be followed by cancellation of the commission agent's licence in addition to such other steps as may be taken against him.

Notification Regarding Printing of Cotton Cloth

By a notification in the *Gazette of India Extraordinary* dated 6th March 1945, the Government of India have restricted the activities of those who are engaged in printing of cloth, procurement of cloth for printing and disposal of printed cloth.

The notification provides that no one can acquire a cloth printing machine after the 6th March 1945 and no owner of a printing machine may work it for more than 11 hours a day. Mills and power-loom factories owning a printing machine are prohibited from printing any of the cloth produced by them nor can they send out their production for machine or hand printing. No such mill or factory, not having a printing machine, can get more than 7 per cent. of its total cloth production printed outside, only 5 per cent. of its total production being allowed to be hand printed. No owner of a printing machine can purchase cloth for printing though he is permitted to print cloth on a contract basis. No dealer in cloth can get his cloth printed without the permission of the Provincial or State textile authorities concerned. The notification introduces various restrictions on the kinds of cloth which can be printed and the colours that can be used.

COTTON TEXTILES FUND

Administrative Body

The Government of India have announced in a *Gazette Extraordinary*, dated 5th March 1945. the formation of a committee to administer the Cotton Textiles Fund.

The committee will consist of five members to be nominated by the Industries Committee of the Textile Control Board (these nominees need not be members of the Industries Committee themselves), one member to be nominated by the All-India Handloom Board, two members representing exporters to be nominated by the Commerce Department, one member representing cotton interests to be nominated by the Industries and Civil Supplies Department, in consultation with the Education, Health and Lands Department and the Indian Central Cotton Committee, and three official members nominated by the Government.

No fewer than three and not more than five non-official members, who have technical knowledge or educational experience which the Government consider will be of special value to the committee, will be nominated by the Government.

The chairman of the committee will be nominated by the Government from among the five members nominated by the Industries Committee of the Textile Control Board. The secretary will be an officer of the Textile Commissioner's office.

Order on Mill Cancelled

The Textile Commissioner's order controlling the distribution of the production of the India United Mills has been cancelled with effect from 3rd March 1945.

Planning the Card-room of a Fine Counts Mill

By SORAB DINSHAW, L.T.M., *Carding-Combing Assistant*

Kohinoor Mills, Bombay

Mr. Sorab Dinshaw, the writer of this article, passed the examination for the L.T.M. Diploma of the V.J.T. Institute in 1939, *obtaining the Shepherd Memorial Scholarship and other awards for the highest aggregate total of marks in the final year. He then proceeded to England in July* 1939 *for a course of practical training at the laboratories and workshops of Messrs. Platt Bros., Oldham, and Howard and Bullough, Accrington, and obtained first class credentials for his training. Under the auspices of the Oldham Technical College he also obtained the full technological diploma of the City and Guilds Institute of London in advanced cotton carding and spinning.*

Mr. Dinshaw returned to India in December 1940 *and since that year has been employed by the Kohinoor Mills, Bombay, first as Winding-Doubling Assistant for the manufacture of sewings and cable threads, and later as Carding-Combing Assistant.*

Mr. Dinshaw was awarded the Textile Association (India) Gold Medal for 1944 *for an essay on " The scheme of organisation and management, specification of machines and a complete plan of their layout, number of operatives, stores and accessories, for a model cotton spinning mill of* 20,000 *spindles working equally on* 20*s*, 30*s*, *and* 40*s*."

IT does not require much pondering to plan out the installation of ring spinning frames in their stereotype sheds because these frames belong to one category and are almost similar in shape and size.

But the card room with its veritable museum of machines, especially in a Fine Counts mill—sliver lappers, ribbon lappers, combers, and what not!—confronts the mill manager with the most complicated problem of planning.

Generally speaking, spinning and weaving sheds present a neat appearance so far as the layout of machines is concerned. But how often do we find in the card-room the slipshod non-methodical arrangement of a vast variety of machines with such narrow, unseemly, and crooked passages that it would be even difficult for a new recruit, to find his way about? It is not an uncommon sight to find some cards glaringly mixed up with drawing frames, combing equipment dumped in a corner, some rovers arranged at right angles and some parallel to the length of the room, and other hundred-and-one such awful instances!

For a systematic planning, the following items must be borne in mind:—

(*a*) Divide your whole lot of machines in the following order:—(1) Cards, (2) sliver and ribbon lappers, (3) combers, (4) drawing frames, (5) slubbing frames, (6) inters and rovers. It will be noticed that in the group (6) are put together inters and rovers and this is a good practice because of almost similar length, breadth and nature of these two machines.

(*b*) After dividing in these lots, plan your layout in such a way that each lot stands distinct from the succeeding or preceding lot of machines.

(*c*) As far as possible arrange your slubbers in a predominantly central position to be succeeded by the intermingled (yet arranged in a convenient series) row of inters and rovers and preceded by their respective drawings. Some planners prefer to arrange slubbers, inters, rovers, all in one row, but this is rather untidy and the undue amount of fluff emanating from the slubbing flyers is likely to pollute the more finished inter and roving material.

(*d*) Enclose your complete combing equipment, including sliver and ribbon lappers, within dustproof walls, running from end to end and upto the ceiling. Thus the combing equipment and the fine combed product will not be " harmed " by the fluff and fly constantly liberated from the cards (and speeds). Also the combing section, on account of small enclosed space, will be under far better humidity control and there will be far less licking of cotton fibres on the leather detaching rollers.

For the sake of enclosing the combing equipment, a certain departure from general practice is to be made as explained herewith. In Fig. A, construction of a wall all across the length on either side of the combing department is a source of blocking ventilation and light for the carding department in the north and speed-frame department in the south in a storeyed building. But deviating from the standard practice and arranging departments widthway as shown in Fig. B is far more beneficial. Extra walls are put up on either side of the combing department but without blocking light or ventilation in the least for other departments. Hence machines must be arranged as shown in Fig. B only, for obvious reasons.

(*e*) The carriage of material from one process to another must be effected with the greatest ease without covering unduly long distances.

(*f*) Adequately wide passages, free from bends and convenient for moving baskets and cans, and easy to sweep must be provided for in all possible places.

(*g*) Storing of process material and empties: Open spaces must be provided to keep surplus of full and empty cans. Empties must be stored up in racks. For the slubber make racks at the out-end of same width as the slubber, a foot deep and five feet high. For the inters and rovers, erect suitable racks within the walls so that they do not protrude in the alleyway as an obstruction.

(*h*) Ratio of machines and balancing of their output: There is no hard and fast rule as regards the number of machines to be had in each group per each preparation. This depends on the quality, output, space available, experience, etc. Take the example of a slubber doing 1,200 lbs. in 10 hours. This would mean that 12 combers each doing 100 lbs. or 8 combers each doing 125 pounds will be necessary for that slubber. Whereas, in combing, quality is gained in the former, less cost and capital are gained in the latter, in the above instance.

Production must be arranged in such a way that there will be a slight excess of back-stuff for every group, of course without dropping down the efficiency of any department. Take the instance of 1 slubber doing 1,200 pounds and feeding 2 inters to produce 1,100 pounds, which means an excess of 100 pounds of slubbing bobbins over its corresponding inters, or, in other words, ever so often we have at our disposal the production of one slubber and were the slubber to be stopped for almost a day to affect an unforeseen repair or a full-day cleaning, its corresponding inters will not be affected because of the adequate accumulation of back-stuff. Applying this principle all over, cards must produce an adequate excess of material over the requirements of the combers, combers over the drawings and slubbers and so on, depending on the circumstances and judgment of the carder.

(i) Ordering out machinery: It is necessary to sound a strict note of caution in this matter. Do not be completely carried away by the several new devices and patent systems such as speed frames which claim to convert a drawing-frame sliver into a fine-hank roving which can be used directly on the spinning-frame, electric stop-motions on the draw-frames,

North

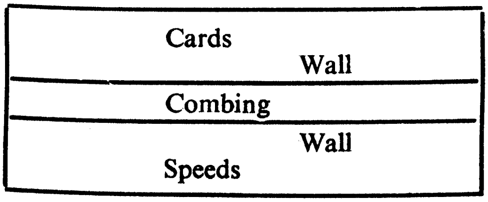

FIG. A.

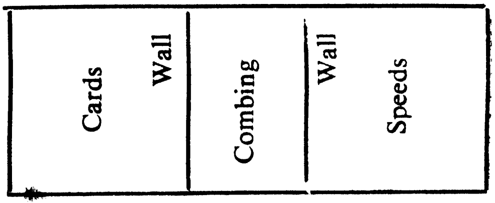


South

FIG. B.

non-stripping, non-grinding, card-wires, and so on. In this matter I would suggest the adherence to the standard English systems which have proven themselves over long periods, with a sprinkling of the few modern devices. With the general low calibre of our Indian operatives, coupled with their negligence, some of the best and most modern devices have failed to achieve results which their manufacturers claimed for them.

Cards

The modern tendency is to economize in space, capital outlay, etc., by ordering out 45" cards, the widest that can be made. But the flats have a tendency to bend in the centre unless made of sturdy construction. Also the 45" laps are likely to be mishandled in their transit from blow-room to cards. Practical width recommended is 40". Adopt a coiler for 12" cans, for they hold more material, which is an advantage for the next process.

Combing Equipment

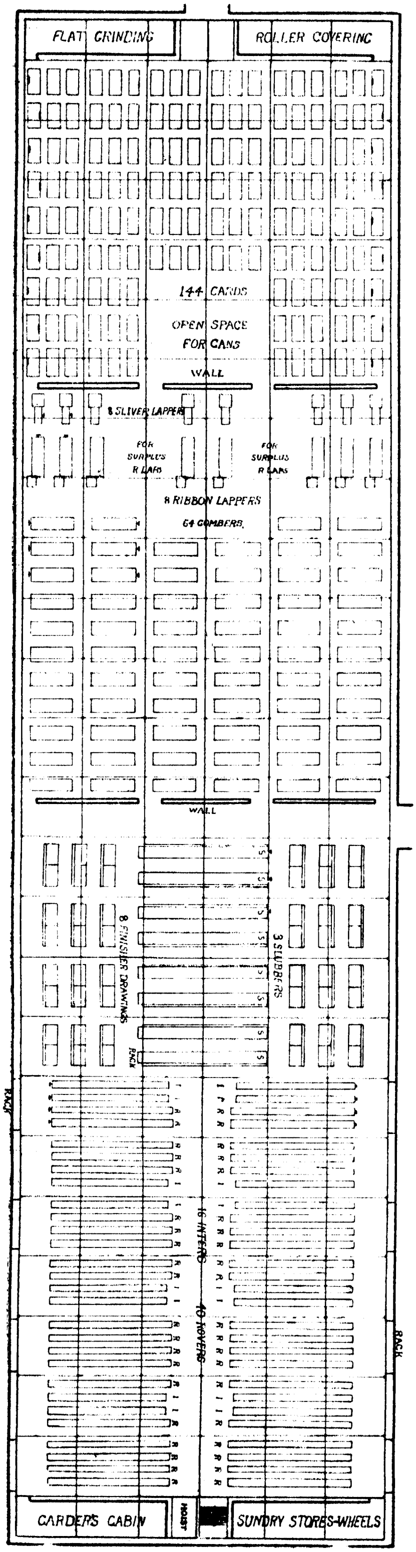
The New Model Nasmith Comber made by Platt Bros. of Oldham, has surpassed all its sister makes, and is particularly recommended where quality-cum-quantity is required. Other outstanding features of this machine are such as all adjustments can be made by standing in front of the machine, good control over waste percentage and quality, improved working of the main engine, and so on.

Drawing Frames

These can be arranged in several ways such as zig-zag, or all three heads in one line or on tandem principle with gearing at one end or in the centre, the last named being more efficient. On account of wider settings, big diameters of rollers—front to back 1½", 1¼", 1½", 1½"—are certainly far more efficient because of better control over fibres and smoother running due to less revs. per min. Whether to adopt electrical stop-motions in favour of mechanical is a matter of one's own private judgment which in my case happens to be in favour of the latter.

Speed Frames

As these machines are to be ordered out for combed cottons, and finer hank rovings, it is to one's own advantage to depart from the usual number of spindles per machine, i.e., 84 per slubber, 120 for inter, and 160 for rover, and go in for units with more spindlage, such as 100 for slubber, 144 for inter and 216 for rover. They reduce the costs of production and outlay. When ordering longer frames, the one question that



Card-room Layout for a Fine Counts (average 80's) Cotton Spinning Mill.

arises, is of their maintenance. Here it can be pointed out that on account of the clean class of combed cotton and finer hank rovings that are put through them, they (machines) remain in a fairly constant state of cleanliness (and, therefore, almost trouble-free) which in itself is a temptation to order out more spindles per unit. Roller diameters should be as big as permissible. Generally speaking, for slubber, 1⅜", 1¼", 1⅜", inter 1¼", 1⅛", 1¼", rover 1¼", 1⅛", 1¼". In some up-to-date methods of construction, the oldish type of skew-gear for spindles and bobbins has given place to helical-gear for noiseless running. How far the latter can be adopted depends on the difference of cost in the two systems. Full bobbin diameter for a slubber should be from 5" to 5½", lift 10", for inter, same as slubber, for rover 3" to 3½" dia. of full bobbin, 7" lift, for all practical purposes.

To make our discussion on this aspect of mill planning more complete, a comprehensive line-sketch of an '8-prep' card-room is given on the opposite page. It consists of 8 slubbers (i.e., 8 preps) and their respective drawing frames arranged to occupy a fairly central position. These are proceeded by 64 combers, 8 ribbon-lappers, 8 sliver-lappers (all enclosed within dustproof walls) and 144 cards, respectively, and succeeded by 16 inters and 40 rovers arranged in the convenient order of 2 inters and their corresponding 5 rovers in two rows as indicated. Total number of roving spindles is 8,160 capable of producing slightly more than 7,800 pounds of 8-hank rovings per day of 11 hours including an hour's recess. Cards, sliver and ribbon lappers and combers will be group driven. Drawing and flyer frames will be driven by individual electric motors with fast and loose pulleys on the machine-shaft.

With reference to the sketch are compiled two tables, one of them giving useful information on speeds, productions, spindlage of fly-frame unit, etc., and the other giving approximate dimensions of the various machines used therein.

TABLE No. I.—*Useful Data* (*with reference to the Sketch*)

					Per day of 11 hours including 1 hour's recess				
Machine	Revs./min. of spindle	S.S. of front roller in ins./min.	Turns per inch	Hank of roving	Production/spindle (after deducting loss due to doffing, etc.)		Production per machine in pounds (actual)	Loss due to doffing and breakages	Card-room production for each section in pounds
					Hanks	Pounds			
Rovers ..	1,200	424.3	2.828	8	7.70	0.963	196.45 (204 sps.)	8%	7,858 40 rovers =8,160 sps.
Inters ..	650	541.2	1.201	2.5	9.66	3.86	501.80 (130 sps.)	10%	8,028 16 inters =2,080 sps.
Slubbers ..	440	687.5	0.640	1	10.37	10.37	10,37.00 (100 sps.)	24%	8,296 8 slubbers =800 sps.
Drawings ..	—	1,650.0	—	0.20	—	—	1,040 (8 dels.) (2 × 4)	20%	8,320 8 F. drawings= 64 F. deliveries
Combers ..	Lap weight = 23 dwt. per yd. Nips per min. = 95 Waste removed = 18% Teeth of lap ratchet taken at every stroke = 4 teeth			0.20	—	—	140 (6 boxes)	5%	8,400 60 combers working 4 stopped for gauging
Cards ..	Lap weight = 11 oz./yard, = .00173 Hk.-lap. Doffer dia. = 27", revs. per. min. = 9			0.18	—	—	77.20	5% (stripping, etc.)	10,500 136 cards working 8 stopped for gauging

TABLE NO. II.—*Machine Particulars* (*with reference to the Layout*)

Machine	(Includes the drive) length × breadth (approximate)	Some particulars
Card	10′-5½″ × 5′-3″	40″ on wire with coilers for cans, 12″ diameter.
Sliver lapper ..	8′-3″ × 5′-½″	Square-back, 9″ lap, 20 cans up.
Ribbon lapper ..	16′-1½″ × 4′-9″	Six boxes, 10½″ lap.
Comber	14′-8″ × 3′-7″	Six boxes.
Drawing	14′-4″ × 4′-10¼″ (with cans)	2 heads of total 8 dels., 15″ staff, gearing in centre.
Slubber	40′-5¼″ × 4′-6″ (with cans)	100 sps., dia. of full bobbin 5½″, 18″ staff, 4 sps. in each box.
Inter	38′-8½″ × 3′-0″	130 sps., dia. of full bobbin 5″, staff 19¾″, 6 sps. in each box.
Rover	43′-4¼″ × 3′-0″	204 sps., dia. of full bobbin 3½″, staff 19″, 8 sps. in each box.

Canada's Trade With British India

Indian Trade Commissioner's Report

THE total Indo-Canadian trade for the year 1943 was valued at $151,666,000, a decrease of $37,564,000 from the all-time high figure of $189,230,000 recorded in 1942. Imports of $17,090,000 from British India during the year were $4,256,000 less than in 1942, while exports of $134,576,000 to British India were $33,308,000 lower. Increased restrictions on exports and imports in both countries together with the scarcity of shipping space available largely contributed to the decrease.

Canada's imports from British India during 1943 only comprised 1.0 per cent. of the total Canadian imports. This was a decrease from 1942, as while the total Canadian imports continued to increase during 1943 the imports from India recorded a decrease. Canadian domestic exports to British India during 1943 accounted for 4.5 per cent. of Canada's total exports during the year. As in the case of the imports, exports to India also showed a decrease, the percentage of the total exports falling from 7.1 per cent. to 4.5. The steady increase in the Indo-Canadian trade, both in imports and exports, that was experienced up to 1942, was broken in 1943.

British India ranked fourth as an exporter of goods to Canada during 1943, being exceeded in this respect by the United States, the United Kingdom and New Zealand. In 1942 India ranked third but during the year Canada's imports from New Zealand increased and that country rose to third position as a supplier of Canadian imports. As an importer of Canadian goods India ranked fourth in 1943, the same position she has held since 1941. The United States, the United Kingdom and Egypt surpassed India as customers for Canadian goods during 1943. In total value of trade for the year India was fourth in order of importance, total Indo-Canadian trade being exceeded by Canada's trade with the United States, the United Kingdom and Egypt. In 1942 India held the same position in Canada's total trade.

Trade Inquiries and Openings

The official controls upon commercial trading that were developed during 1942 by both the Indian and Canadian Governments were extended in some respects and relaxed in others during 1943, but on the whole were not radically changed in character. These controls together with the continuing shortage of shipping space from India made any expansion of import or export trade between India and Canada during the year rather difficult. Imports from India were largely confined to a few essential items while exports from Canada were in the main part war supplies or goods urgently needed for the war effort. There was little movement between the two countries of goods for purely civilian purposes.

These conditions were reflected in the number of trade inquiries received during the year. In the early part of 1943 the inquiries received were comparatively few in number but in the latter part of the year a noticeable increase in the number of inquiries coming into this office was experienced. Allied military successes and some improvement in the shipping situation encouraged commercial trading firms in both countries and they began to inquire about prospects for post-war trade. Many Canadian firms were desirous of making contacts with Indian firms now so that they would be in a position to enter into business relations with them when normal trading conditions return after the war. Other firms, which had been importing Indian products indirectly through the United Kingdom and the United States, wished to deal direct in the post-war period and inquired for assistance in making direct connections.

Second All-India Textile Conference

Inaugurated By Sir Joseph Kay, Kt.

Amid scenes of enthusiasm the Second All-India Textile Conference, organized by the Textile Association (India) with the collaboration of the Victoria Jubilee Technical Institute, Bombay, met on the 27*th and* 28*th February and* 1*st March* 1945, *in a spacious pandal specially erected for the occasion in the compound of the V.J.T. Institute. The Conference was inaugurated by Sir Joseph Kay, Kt., Managing Director of W. H. Brady & Co., Ltd., Bombay, a prominent millowner who was Chairman of the Millowners' Association, Bombay* (1921, 1922 *and* 1935), *and President of the Bombay Chamber of Commerce in* 1926.

Messages wishing the Conference success were received, among others, from Sir Victor Sassoon, Sir H. P. Mody, Sir Sorab Saklatvala, Mr. K. M. D. Thackersey, Mr. M. K. Vellodi, Mr. G. D. Birla and Mr. B. W. Batchelor.

The proceedings began with the singing of Rabindranath Tagore's " Jana Gana Mana," followed by the welcome address of Mr. Nandulal Mehta, B.A., LL.B., Manager of the Morarjee Gokuldas Mill, Bombay, and Chairman of the Reception Committee. Sir Joseph Kay then delivered his brief but comprehensive address which took less than an hour.

The afternoon session on the first day was presided over by the Hon'ble Justice Sir Harsidhbhai Divatia, M.A., LL.B., Kt., President of the Industrial Court, Bombay, and Chairman of the Bombay Textile Labour Inquiry Committee, 1938-40. *The whole of this session was devoted to the reading of papers on labour welfare and labour legislation by Mr. Thomas Edward, Mr. A. S. Banavalikar, Dr. K. V. Joglekar, Mr. Bordawekar and Dr. D. B. Kirtikar, while Mr. R. G. Gokhale, Labour Officer, the Millowners' Association, Bombay, and Mr. J. D. Harrison spoke on the education, health and welfare of the worker as Priority No.* 1.

The third session, which met on the afternoon of the second day, was divided into two sections ; one section on " fibres," presided over by Mr. D. L. Sen, Acting Director of the Indian Central Cotton Committee Technological Laboratory, and another section on problems of " ventilation, humidification and electric drive," presided over by Mr. G. S. Karpur, Chief Engineer, Khatau Mill, Bombay. In the former section, papers on synthetic fibres, utilization of vegetable silk fibres for textile purposes, and the cotton fibre, were read by Mr. G. R. Kelkar, Mr. R. N. Kapur and Mr. C. Nanjundayya, while Mr. A. N. Gulati's paper dealt with the future of Indian textile fibres. In the latter section, Mr. V. A. Ajgaonkar read a paper on the humidification and ventilation of textile mills with special reference to loom sheds, Mr. T. M. Shah read a paper on air-conditioning plants for textile factories, and Mr. R. S. Ponkshe on the electric drive as applied to textile mills.

The last session met on the afternoon of the third day under the presidentship of Seth Ramnath Podar, of Podar Sons Ltd., and Chairman of the Marwari Chamber of Commerce, Bombay, and of the Silk and Art Silk Mills Association, Bombay. This session was devoted to a discussion of the Platt Report and recent trends in textile machinery development. Instructive papers on the implications of the Platt Report for the Indian cotton mill industry and the question of its post-war re-equipment and rehabilitation were read by Mr. B. B. Joshi, L.T.M. (*Hons.*), *A.T.I., Additional Controller of Raw Materials and Stores, Cotton Textiles, Government of India ; Mr. S. D. Oke, Weaving*

Master, New Kaiser-I-Hind Mills, Bombay; Mr. Hughes, General Manager, Shree Ram Mills, Bombay; and Mr. J. Mordecai, General Manager of the Century Spinning and Manufacturing Co., Ltd., Bombay.

An interesting paper was also read on the position of the handloom industry in the post-war world by Mr. M. P. G. Nair, Principal, Institute of Textile Technology, University of Travancore. The series of papers and discussions was rounded off with a most instructive and entertaining talk on "Safety First" in mills and factories, by Mr. A. S. Trollip, B.Sc., C.I.E., General Manager, Bombay Electric Supply and Tramways Co., Ltd., and Joint Honorary Secretary, the Safety First Association of India, Bombay.

The Conference was attended by nearly a thousand delegates from all parts of the country. Its importance was recognized last year when millowners and mill managements up-country deputed their representatives to the Conference on their behalf. Similarly almost every textile manufacturing centre of any importance was represented at the latest Conference, although the top men of the industry in the city of Bombay were unaccountably absent.

The Conference awarded in absentia *its Honorary Fellowship for the year to Dr. Nazir Ahmad, President, Textile Association (India) and Director of the Technological Laboratory, Indian Central Cotton Committee, in appreciation of his services to the study of cotton textile technology; the first Fellowship was awarded last year to the late Mr. Cowasji Dorabji Panday, of the Panday Textile Trust, Bombay.*

It is indicative of the growing popularity of the Textile Association (India) that it has to-day a membership of 1,700 *and that it has already opened branches in Sholapur, Khandesh, Ahmedabad, and Cawnpore. The University of Bombay and the Textile Institute of Manchester sent delegates to the latest Conference organized by the Association. Further, it was asked to depute two of its members to serve on the Committee of Principals of Technical Institutes and it was consulted in the framing of the syllabus for the proposed degree course in textile manufacture. Rules for the award of A.T.A. (Associateship) and F.T.A. (Fellowship) diplomas of the Association have been formulated and it is expected that the first awards will be announced shortly.*

Prize Winners

The following were the winners in the prize essay competition:—

Mr. Sohrab Dinshaw, L.T.M., Assistant in Carding and Spinning, Kohinoor Mills, Bombay, spinning essay, "A Complete Scheme of Organization and Management of a Model Spinning Mill of 20,000 Spindles working equally on 20s, 30s and 40s." (Textile Association Gold Medal.)

Mr. S. H. Tirodkar, Assistant Weaving Master, Shree Ram Mills, Bombay, won a cash prize for Weaving Essay on "A Complete Scheme of Organization and Management for a Weaving Mill of 500 Looms." (Khatau Prize of Rs. 150.)

Mr. K. H. Shah, B.Sc., B.Sc. (Tech.), Research Chemist, Department of Chemical Technology, University of Bombay, submitted the best essay in Dyeing, "Possibilities of Manufacturing Common Dyes from the resources available in India." (Morarji Mills' Gold Medal and a Cash Prize of Rs. 150.)

The following were the winners in the prize design (woven and printed) competition:—

Mr. Shivdutt Rai, Senior III Class student, Government Weaving Institute, Benares, submitted the best design in Weaving, "A Design for a 4″ Saree Border on a 200 Jacquard." (Tata's First Prize of Rs. 100.)

Mr. J. G. Kamat, L.T.M., c/o Finlay Mills, Bombay, won the second prize in Woven Designs, "A Design for a 4″ Saree Border on a 200 Jacquard." (Tata's Prize of Rs. 50.)

Mr. G. K. Shirodkar, Designer, Bombay, submitted the best design in Printing, "A Design of not more than 4 Colours to be printed on Crepe Cloth for Ladies' Dress Fabrics," and thus won the first prize of Rs. 100 (Tata's Prize.)

Miss Jini H. Kohla, student of National School of Arts, Bombay, won the second prize of Rs. 50 in Printed Designs, "A Design of not more than 4 Colours to be Printed on Crepe Cloth for Ladies' Dress Fabrics."

Along with the Conference, an exceptionally well planned and highly instructive exhibition of textile fabrics and processes and of textile machinery accessories was held in the Conference grounds. Prominent mills, chemical manufacturers and machinery agents had opened their own stalls in the exhibition, which served to enlighten and instruct the hundreds of visitors who poured in during the week that it was kept open.

The organizers had made excellent arrangements for the entertainment of the delegates and visitors. Short dramatic pieces in Marathi, Gujerati, Hindi and English were put on the boards on the first evening. On the second evening there was a programme of dances, including a textile ballet and Kathakali *songs and instrumental music, and on the third evening a programme of light and classical music, the technical staff employed in the local mills having taken a very prominent part in the dramatic performances.*

It was again found impossible, however, owing to war-time restrictions and rationing difficulties, to organize social functions in connection with the Conference. The proceedings of all the three days were keenly followed and the standard of the papers and the discussions thereon was uniformly high. It is to be hoped, however, that at least next year the restrictions on paper supply will be relaxed to the extent of making it possible for the organizers to print and circulate in advance copies of the papers to be presented at the Conference, or, at any rate, useful synopses to enable the delegates to come prepared to take an active part in the discussions and deliberations of the Conference.

WELCOME ADDRESS OF Mr. NANDULAL M. MEHTA

FRIENDS AND BROTHER DELEGATES,

During the absence, out of India, of Dr. Nazir Ahmad, the President of the Textile Association (India), as a member of the Mission of Indian Scientists, the duty of welcoming you all to this Second All-India Textile Conference has fallen on me. I consider it a high honour to extend to all of you a most cordial welcome to this second annual gathering of textile technicians from all over the country. Many of you have travelled hundreds of miles from far-flung textile centres of India, at considerable expense and personal inconvenience to yourselves in these days of hardships, and will be travelling back to your respective places of work with equal personal inconvenience. During these days of controls and rationing, it is difficult for the Reception Committee to provide for you even the bare necessities, not to mention amenities and comforts. The Committee has done its best to squeeze out maximum concessions, within the limit of the various controls as interpreted and enforced by the controlling executives. I hope that you will look upon these inconveniences with indulgence and sympathise with us in our short-comings.

As you all know, the First All-India Textile Conference was held in this very ground last year, during the *Holi* holidays, on 9th, 10th and 11th March, under the distinguished presidentships of Sir Victor Sassoon, Bart., Sir Sorab Saklatvala and Mr. Camar S. Tyabji. The unique success of that conference inspired the Textile Association (India) to undertake the responsibility of organizing this second conference after one year. The Reception Committee has the good fortune of securing three distinguished persons to preside over the deliberations of the Conference. Sir Joseph Kay, who has consented to do us the honour of inaugurating the Conference and of opening the Textile Exhibition attached to this conference, is a distinguished industrialist and business man of our city, being the Managing Director of Messrs. W. H. Brady & Co., Ltd., who control three cotton mills in the city and a number of large and small industrial and business concerns. The afternoon session of to-day will be presided over by the Honourable Justice Sir Harshidhbhai V. Divatia, Judge of the High Court of Judicature, Bombay, and President of the Industrial Court. The last day's session will be presided over by Sheth Ramnath Podar, a distinguished industrialist, business man and millowner of our city. The Reception Committee is deeply thankful to these three great men for accepting our invitation to preside over the respective sessions of this conference.

Rise and Growth of the Textile Association (India)

The Textile Association (India), which is principally responsible for this conference, has, during its short existence of only six years, striven its best to acquire and maintain the reputation of being a pioneer and truly representative body of textile technicians all over India. There is hardly a textile centre of any importance in India, which has not got a member of this Association. The phenomenal rise and growth of the Association has proved that it had filled up with vitality, energy and activity, the vacuum that existed between one textile mill and another and between one textile centre and another, so far as the technical staff was concerned. It has linked up its members into a bond of common weal and reciprocity. It has brought among the textile technicians of the country a self-consciousness and a self-evaluation of their importance in the economy of the textile industry and a reorientation of their attitude towards one another.

The ambitions of the Association have been succinctly laid down under the caption 'objects and methods,' in its rules and regulations. Conferences of this type are but a medium providing a platform for the achievement of these manifold objects of the Association. During and after the last conference, suggestions were made that regular subjects committees should be constituted to draft out resolutions to be discussed and voted upon at the Conference. This is not possible under the present constitution of the Conference. If the resolutions adopted at the Conference and the opinions reflected therein are to carry weight and influence, clear and well defined constituencies of the various groups and classes of textile technicians should come into existence, so that their delegates may have a truly representative character. With its present limitations, the Conference must confine itself to deliberations and discussions of the various subjects vitally affecting the textile industry of our country.

Photo: Central, Bombay

Mr. Nandulal M. Mehta, B.A.LLB., Manager, Morarjee Goculdas Mill, Bombay.

After passing the LL.B. examination, Mr. Nandulal Mehta joined the Morarjee Goculdas Mills, Bombay, in July 1918. He was made Assistant Manager in May 1925 and Manager in May 1934. He was a member of the Labour and Technical Advisory (Managers') Sub-Committee of the Millowners' Association, Bombay, from 1936 to 1941 and of the Advisory Committee of the Government Apprentice Scheme from 1937 to 1941. Chairman of the Managing Committee of the Textile Association (India) since its formation in 1939, he was also the President of the Bombay Textile Clerks' Union in 1940 and 1941.

Textile Technician's Position

The position of the textile technician in the industry has been very ill-defined and nebulous and resembles a buffer state, which has to absorb shocks from its two powerful neighbours, viz., capital on his right and labour on his left. But with efflux of time, he has begun to assess, though very slowly, his rights and responsibilities. Next to agriculture, the textile industry is the second largest industry of our country. After very nearly one century of its existence, this class of textile technicians has not been able to assert itself as powerfully as it should in its relations with capital and labour. The present war has put to test the resourcefulness not only of nations but of industries, technicians, labour, etc. When normal conditions are restored in our country, in our industry and in our daily life, we, the textile technicians, should not forget the lessons that we have learnt and the experience that we have gained during the present war. We are a force in the growth of the industries of our country. War-time methods in our textile industry and war-time substitutes of essential materials have opened our eyes to the enormous potentialities of post-war development in various directions, so far as our industry goes. The members of the Textile Association (India) had an opportunity of once discussing, among themselves, at one of their informal monthly meetings, the subject of "War-time stores." The amount of information that came out during the course of the discussions revealed the resourcefulness of our technicians and was a measure of their self-reliance in times of scarcity of essential articles of stores. During war-time, some methods and materials must be used even at the cost of efficiency and quality, in order to avoid a complete break-down and stoppage, but it would be foolish to continue such methods and materials after the return of normal conditions. But this should not blind us to the enormous potentialities of our indigenous resources and their place in the economy of our industrial life. This brings us to the realization of the inadequacy of our equipment in the direction of technical research. It should be the ambition of the Textile Association (India) and conferences of this type to provide the necessary facilities of equipment to the technician to work out, in his own way, the various problems which beset him in his work. He must have free and easy access to a library and a laboratory. It is sad to observe that this city, with a record at its back of about one century of textile industrial development, cannot boast of a single decent library of technical books of study and reference accessible to any technician. Cannot the textile industry afford to establish and maintain one such library worthy of its reputation and the reputation of this city? The absence of a well-maintained library and reading room is a real hardship to us. The Association will soon be in a position to formulate its plan for a library and reading room worthy of its name and it will launch a vigorous drive to put it through and thus meet a crying need of the industry. Similarly, the absence of a laboratory where the textile technologist can carry out his own experiments in various directions on raw materials, stores and sequence of processes is also a great handicap, which requires early attention. Although such facilities are not within the means of this Association to provide in the near future, the Association can arrive at a working arrangement with the Technological Laboratory of the Indian Central Cotton Committee, the Department of Chemical Technology of the University of Bombay and the Victoria Jubilee Technical Institute, by which the members of the Association may be given necessary facilities to carry on their research work in several directions, without payment of the scheduled fees, which the research technologist can ill afford to pay. I understand that some sort of arrangement exists in the United Kingdom, by which capital sums spent by industries on research work are exempted from excess profits tax and are allowed as business expenses. We have no information if our industrialists have pressed for a similar concession on our Government. If they have already done so, the result is not known to the public.*

Invasion of Synthetic Fibres

In post-war development, King Cotton will not be too sure of his throne. Ominous rumblings of the invasion of synthetic fibres in the imperial realms of King Cotton are clearly audible on the distant horizon. Indian weather conditions and the extremely low standard of life of the average Indian will hardly permit extensive replacement of cotton textile fabrics by substitutes of any other kind. But, there will be a variety of fibres and fabrics flowing into India from countries more fortunate in their industrial development and it will be a trying time for the textile technologist to adapt his equipment and his skill for processing the new varieties. If the Indian textile industry receives a fair deal in the post-war period at the hands of the powers-that-be, and if it is not made the dumping ground of the products of other countries or of the

---

*The latest budget of the Government of India has made some concessions on this point. (Please see page 368.)—Ed., *I.T.J.*

reparation goods of countries like Japan, the industry has a good future before it. With several serious attempts at raising the standard of living of the Indians in the post-war period, the demand for consumer goods including textiles will be on the increase and the industry will have to expand considerably to meet this growing demand.

Rationalization and New Machinery

This brings us to the burning question of rationalization, new machinery, new processes, and a host of other post-war problems. Being the very first speaker at this conference, I do not consider it fair and proper to discuss at length, in my welcome speech, problems, which form the subject matter of special papers contributed by eminent and experienced technologists of the industry, which will be read and fully discussed at the subsequent sittings of our conference. The Report of the British Cotton Textile Mission to the United States of America led by Sir Frank Platt, and its importance to the Indian cotton textile industry will be discussed by subsequent speakers at this conference. In post-war development, the problems of individual units, in any one industry and of individual industries, will be governed by so many national, ultra-national and international considerations that to-day's pleasant day-dreams of a post-war Utopia in industry may but prove a mirage. Considerations of exchange, currency, freight space, international obligations, etc., will rigidly restrict the choice of the buyers of post-war equipment.

Possibilities of Manufacture in India

I have already referred to war-time substitutes in the textile industry. While some of them will vanish with the return of normal conditions, some will survive. As I have no desire to boost up or advertise the products of any particular factory or factories, I must refrain from mentioning any names. Referring to machinery and component parts, it must be stated to the credit of some pioneers in these lines that their products will stand comparison with well-known imported articles of the same category. The main object of the Textile Exhibition, which our distinguished President will open to-day, is to focus the attention of textile technicians and industrialists on such products, which, with our efforts and goodwill, must find a permanent foothold in post-war economy of the textile industry. I am not far wrong if I venture to state that, barring the most essential component parts of most of our textile machinery, the bulk consists of a variety of castings, etc. Buyers have to pay heavy charges by way of freight, insurance and import duty on such components, which can, with some skill and perseverance, be fabricated in this country. It will be in the interests of our national economy in post-war planning to encourage existing workshops and to establish new ones for building up textile machines and their various components. When plans are being worked out for the manufacture of motor cars, aeroplanes and locomotives in India, the manufacture of textile machines for the textile industry, which, as I have stated before, is the second largest industry in India, only next to agriculture, should not be long delayed. Till arrangements are made for the manufacture of essential components, our industrialists may, under arrangements with textile machinists in other technically advanced countries, import such essential components only. In due course, with the help of skilled experts, either imported or indigenous, the essential component parts can be made locally. It is the duty of the textile technician to accelerate the development of such lines in right directions by unstinted technical advice and it must be the duty of the mill-owner to show wide tolerance, make some small financial sacrifices and give preferential treatment to machines, components and store articles manufactured in our country. Taking into account the enormous sacrifices which the Indian tax-payer has made during the past several years for the protection of the Indian cotton textile industry, this expectation from the industry is not unreasonable.

During the sittings of this conference for three days, various papers on a number of subjects such as synthetic and natural fibres, their processes, humidity, ventilation, air conditioning, scientific management, post-war problems, labour welfare, industrial health, medical service, etc., will be read and discussed from various angles by persons who have grown grey, or will, in course of time, grow grey in the service of the Indian textile industry. These subjects cover almost every aspect of our textile industry. The very idea of textile technicians discussing such subjects as fall beyond the orbit of their technology may be unpalatable to some millowners, but the technicians will be failing in their primary duty to the industry if they shirk their responsibility and avoid discussions on subjects on which both sides can express their views with equal force and vigour. They must cast aside timidity and claim their rightful place in the industry.

The Technician and the Worker

With the growth of political consciousness, labour will assert its rights. It will be the duty of the technicians, who spend the greater portion of their working days with labour than with the millowner, to understand and appreciate the aspirations of labour and guide it on the right path. The technicians will have to make plans for and execute various rationalization schemes in the near future. This must be brought about by the minimum amount of friction, dislocation or upheaval. Such delicate problems will have to be handled with tact and sympathy towards labour. The technicians must help labour to canalize the expression of its views and try to understand its difficulties. I hope much will be said on these points during our discussions at this conference. To obtain optimum efficiency and production per man and machine, certain minimum standards of working conditions will have to be laid down. It will be the duty of the technical and administrative staff to see that these standards are scrupulously maintained.

Scheme of Competency Certificates for Workers

Although, general and technical education for the mill employees are subjects of separate papers to be read and discussed here, I venture to make a passing reference to one or two important aspects thereof. It is the duty of the Textile Association (India) and our conference to undertake the administration of a scheme of awarding competency certificates to the technical labour employed in the industry. I do not refer to the Fellowship and Associateship Diplomas of the Textile Association (India), the arrangements for awarding which have been completed; the awards will shortly be announced. I refer to the lower grade technical staff and operatives. Without the slightest disturbance to the existing arrangement, we can introduce minimum standards of general education and technical knowledge which aspirants for higher posts in the labour force must achieve. To put it in a nutshell, an ordinary operative, such as a sider or a weaver, should not be promoted to a jobber's post unless he has passed the prescribed test of general education and technical knowledge. The Textile Association (India), with the co-operation of employers' associations in various centres, must lay down a syllabus of the tests required for competency certificates of various occupations in the textile industry and, with the active help of its members, hold such tests and award certificates. The members can go a step further and insist upon recruiting or promoting to higher posts, only such operatives as possess competency certificates of the Textile Association (India). No special classes or institutes will be necessary for such education and training. Aspirants for such competency certificates may be given special opportunities for acquiring practical training in their own department during the usual course of their work. A small beginning must be made, say, in Bombay, the largest textile centre of India and, in its preliminary stage, it may be restricted to a limited number of occupations. Afterwards, it may be extended to embrace as many occupations as possible. In due course, this will raise the general level of education, skill and efficiency of the entire labour force. With no capital outlay of any kind but with the goodwill of employers and with the active co-operation of textile technicians, this scheme, of which I have given the barest outline, will prove of immense benefit to the whole textile industry.

Once again, I welcome you one and all to the Second All-India Textile Conference and to you, Sir Joseph, for sparing your valuable time and giving us the pleasure and benefit of your guidance. I hope that with the generous co-operation of you all the programme of our conference will be carried out with success.

SIR JOSEPH KAY'S INAUGURAL ADDRESS

MR. CHAIRMAN AND GENTLEMEN,

Thank you for paying me the compliment of asking me to preside at the opening of this, the second All-India Textile Conference, and on behalf of the Chairman and Committee of the Association I extend to all delegates a warm welcome, and a special one to those of you who have travelled from other places to take part in the three days of technical and social activities which have been so well arranged by your Committee. I feel sure that at the end of the Conference you will find your time has not been spent in vain.

I have listened, Mr. Honorary Secretary, to your report with considerable interest, and have also been looking through the most recent reports of the Association, and must congratulate the Managing Committee on the remarkable progress which has been made, and which is a clear indication that you of the technical side of cotton spinning and weaving realize what an important part you are to play in the future of the industry, and an institution such as yours, in the light of your collective experience, must be the mouthpiece of what is, and what is not, essential on the technical side for the successful progress of the cotton textile industry, which is of such major importance to the welfare of this country. I wish you continued success.

Photo: Hamilton Studios, Bombay

SIR JOSEPH A. KAY, KT.

You will not, I know, expect me to address you on matters of a highly executive and technical nature, for your programme of discussions and debates has been so arranged as to open up avenues of debates and the exchange of views which must result to your mutual benefit. Let me now, therefore, turn to a few general observations which touch on some of the problems of the day as I see them.

Future of the Industry

We have sure grounds for being optimistic about the future of the industry. The position is obvious, I think, for in the next few years at any rate we are not likely to suffer from external competition and the consequent price-cutting from without. We know, too, that our mills, with a certain number working on double-shift—combined with handloom production—can meet the increasing domestic requirements of the country without producing and selling at unremunerative rates; if we assume, as we must, some extension of the industry, we then have export markets within our reach.

We know that following the curtailment of world-wide production during the war, the world is short of cloth and yarn and that stocks are negligible; so we can assume with some justification that our mills are likely to be running at full capacity for some time to come. But let that optimism be tempered with caution: new fabrics are being introduced; the demands and requirements of the people change; labour legislation and social security schemes will come into being, and may be—though I hope not—price control and price fixing by Government will be continued for some time. **I see no reason—though up to a point we receive a measure of protection—why Government, once the war is over, should interfere with the normal course of trade in the textile industry. Inflation and black-marketing will pass once the**

war's demands cease, and the reasonable competition which is sure to exist again will be such as will ensure the consumer getting his requirements of cloth at proper prices. In the cotton textile industry such a thing as Government versus private enterprise should not arise.

Machinery and Plant

Naturally after the last years of the war effort, when our machinery has had to pay the toll of constant day and night running, our minds must turn to the replacement of worn-out plant, for metals like human beings, must pay the penalty of passing years, and the time comes when the running of machinery is of little or no avail. There is much that needs replacement in the Indian mills, for following the long depression in the textile industry, little or no money was spent, or could be spent, on the replacement and upkeep of machinery for many years. But times have changed, and if we are to hold our own against such competition as we might experience in the years ahead of us, let us at once commence to " put our house in order." But let there be no wild and theoretical planning, as is the fashion of the day, but well-thought-out schemes to replace worn-out machinery by that embodying up-to-date principles; and no indiscriminate extensions without taking into consideration the cost involved. **Remember that spinning machinery will cost you on to-day's prices 100 to 110 per cent. on pre-war values; weaving machinery 70 to 75 per cent.; preparatory machinery 75 to 80 per cent.; bleaching and finishing machinery 75 to 85 per cent., and so on. I suggest, therefore, that when formulating your plans you should take into consideration what you expect to earn in normal times on your capital outlay, otherwise trouble may be ahead of you.** I do not profess to know what course the prices of new plant are likely to take, but I can, with such knowledge as I possess, calculate that it will be difficult for an entirely new mill, built in any of our present manufacturing centres, on to-day's value of land, buildings and machinery, to compete in the years to come with our well-managed existing mills, which are steadily spending money as it is made on the improvement and replacement of worn-out plant. And let this be done on modern lines with a definite end in view, and do not overlook the fact that much research is being done in textile machinery of all kinds, and methods of process might see great changes before many years are over. I am not suggesting for one moment that orders should not be placed now for such machinery as may be required, provided reasonable delivery can be obtained, but I do advocate a policy of reasonable precaution. I deprecate the purchasing of second-hand machinery, such as has been suggested in certain quarters, for, in my view, in that direction retrogression lies.

Labour

Our labour is, and must be, one of the most important problems connected with the development of the cotton textile industry in this country, and it is essential that every effort should be made to secure more understanding relations between master and man; otherwise never-ending troubles will arise and result in losses to both sides. Much has been done in recent years: better conditions of work; the settlement of disputes by arbitration; limitation of hours of work; holidays, and so on, are now in force, but there are still many " gaps " to be filled, and though we have now, I think, an established labour force, there is still something lacking in what is expected of an employee on the one hand, and the responsibilities of the employers on the other. I hope the much talked of Government legislation, as a result of industrial conferences, will not be forced on the industry without due regard to the conditions which prevail in this country. Progress has been made in recent years in regard to the settling of disputes by arbitration, but there is still much to be done, and though further legislation may be necessary, it should be so framed as to permit, in so far as is possible, the mills and workers settling their own differences. The difficulty, of course, is that you have on the one hand the Millowners' Association, which is very sympathetic to labour, whilst on the other you have no really responsible body which can speak for labour, as up to this time the labour movement, such as it is, has come from " without " rather than from " within " the labour force. **Labour must be made**

to realize that if it is to play a more important part in the industry, then it must respond to the benefits which will arise from all the schemes to be introduced for it-- merely more money and less work will not just do !

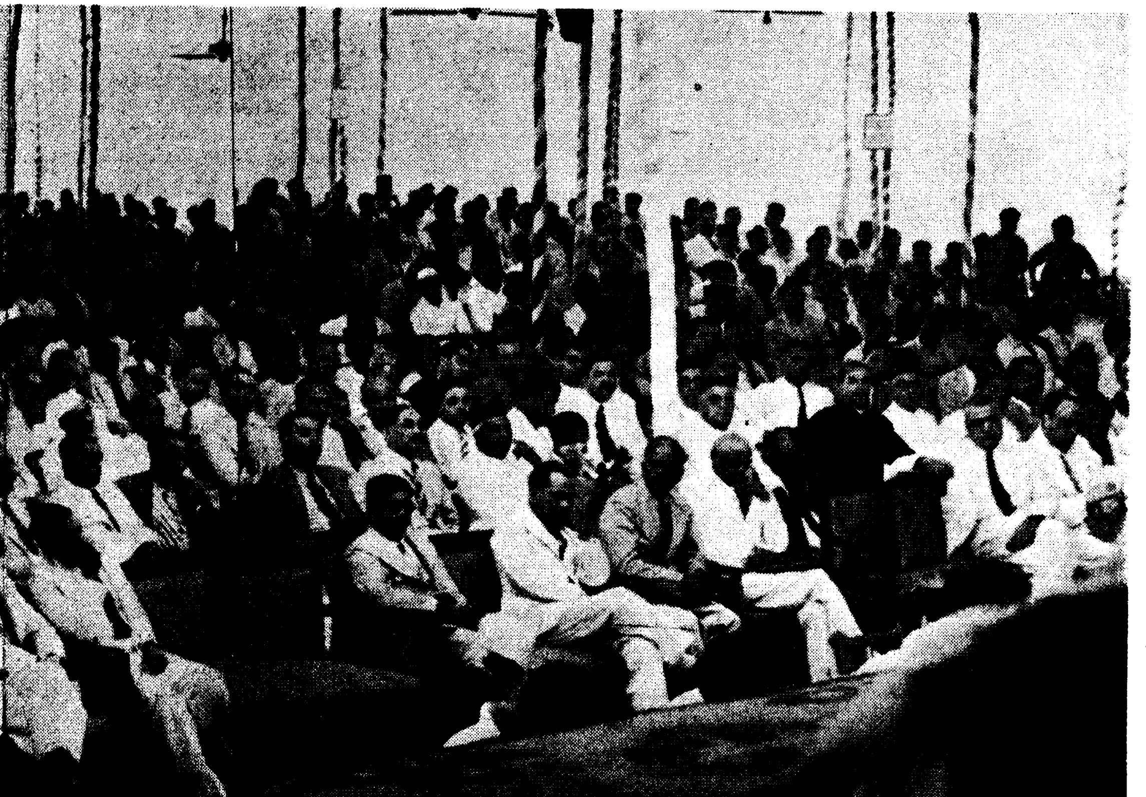
Making-up and Marketing

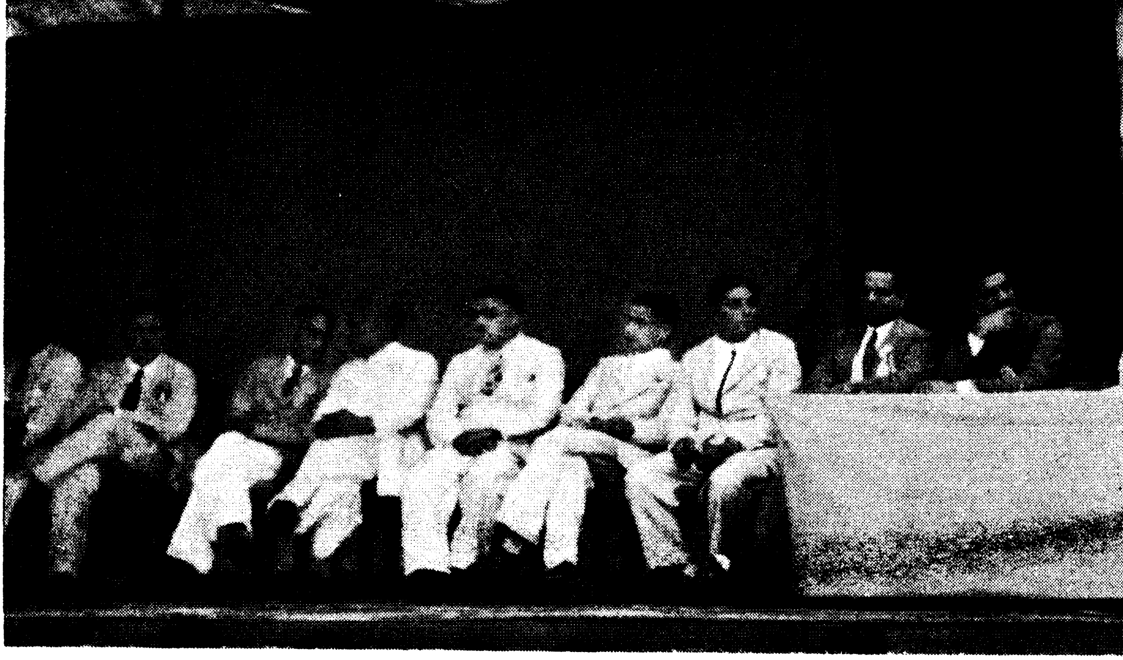
These two matters are very much overlooked, and though the marketing of goods is perhaps outside your province, I do suggest to you that more attention should be paid to the making up of your production to ensure that it reaches the consumer in proper and attractive shape. I know only too well how the technical experts watch their production and efficiency figures, will examine their cloth in the folding department and their yarn in the bundling department, and I know, too, that few ask themselves how that same cloth and yarn will appear to the buyer after it has been baled and either carted or shipped to the consuming markets. I had a case in one of my own mills a few years ago, when I saw in the Calcutta market a bundle of our own *dhotis* after the trials of a sea voyage to Calcutta, which on opening up, owing to careless bundling and packing, compared very unfavourably with a bundle of Japanese *dhotis* which had come all the way from Japan, and I well understand why the Japanese found favour with the buyer, who after all is the man you are finally catering for and is the best judge of your product. The customer is always right !

The Platt Report

Of the many " White Papers " issued in England in recent times on matters relating to industry, none has raised so much interest and criticism as the Platt Report on the Cotton Textile Mission to the United States of America, and it can certainly be termed the " best seller " in so far as the cotton textile industry is concerned. It has been reviewed and discussed here too, but there has been, and still is, some misunderstanding as to its purport owing to there not being a clear appreciation of the terms of reference. As

to the **Conference**





Sir Joseph Kay

I see it, the Mission was to investigate and report on the methods used in the cotton industry in the U.S.A. with a view to making suitable adjustments of the methods used in England, in order to increase production without further calls on labour, and so ensure supplies of cotton goods to meet the essential needs. As you know, the methods followed were:—

(*a*) to compare the productivity of labour in both countries;

(*b*) to account for any differences between the two;

(*c*) to compare production methods of typical American and British mills;

(*d*) to make recommendations for the increase of labour productivity in British mills.

Now obviously, production per man per hour (now known as P.M.H.) was linked up with the type, size, location and condition of plant, and that is why the Mission had to lay so much stress on certain types of machinery in the spinning section, and automatic looms and high speed winders and warpers in the weaving section, otherwise they could not have proved that with normal staffing British P.M.H. (calculated on the basis of total output and total labour force) is less than the American by approximately 18 to 49 per cent. in spinning, by 80 to 85 per cent. in winding, by 79 to 89 per cent. in beaming, and by 56 to 67 per cent. in weaving. And also with normal staffing the British labour requirements exceed the American by approximately 22 to 98 per cent. in spinning, by 387 to 571 per cent. in winding, by 366 to 786 per cent. in beaming, and by 129 to 203 per cent. in weaving. And naturally, this brought certain conclusions for improvement in P.M.H. in Britain, the chief of which were:—

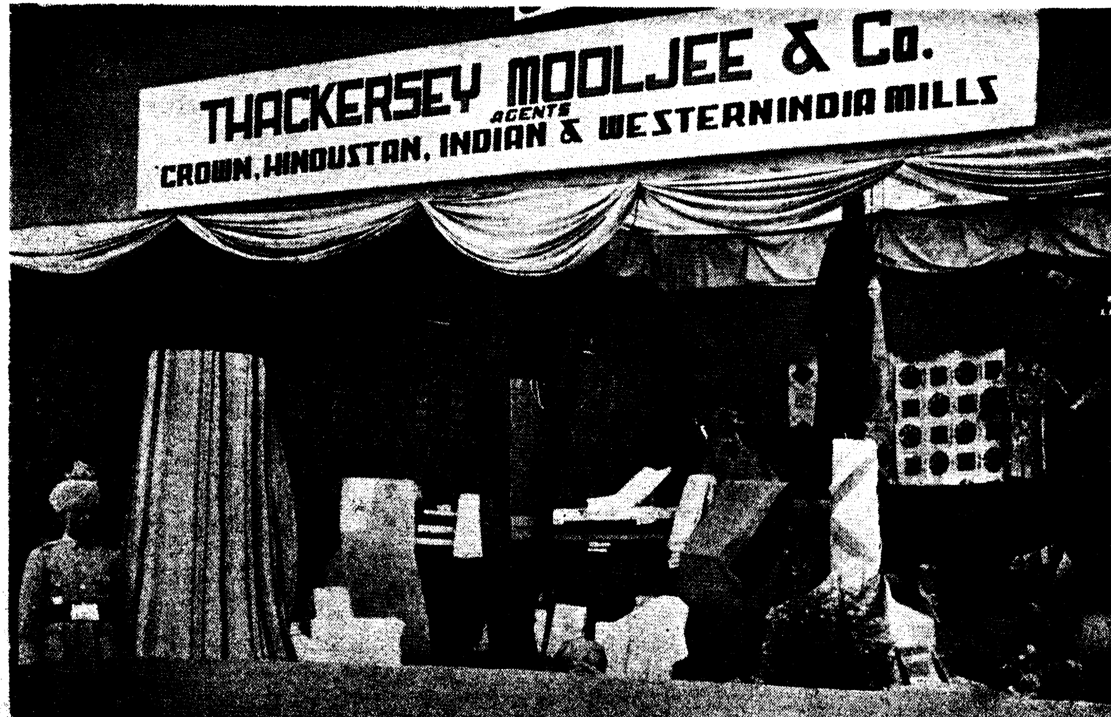
(*a*) improvement in the technique of spinning,

(*b*) a greater number of looms per weaver, relying upon the machine to do the work rather than the man.

A great deal of technical data was submitted to justify these and other conclusions, which of course cannot be included in this brief survey, but to which I commend your careful study.

Naturally, Lancashire was disturbed by these observations and anticipated that there was some undisclosed motive to revolutionize the weaving section of their industry, and they naturally asked where

Sir Joseph Kay opening the Exhibition



A view of the crowd at the Exhibition

was the capital to come from to install new plant; and where were they to sell their mass production, as after all they were dependent on the demands of the many and varied markets for which they catered. And not only that, Lancashire with its long experience of the cotton trade, its force of highly skilled and trained labour, and its knowledge of the world markets, resented any suggestion that it should change from a policy which had stood it in such good stead for so many years, namely: "Quality, not quantity."

Lessons from Platt Report

But let us not be too concerned over that: what we have to do is to extract from this investigation such knowledge as will benefit us in our own industry in the future, **and there is in the Platt Report much which will enable us to turn our minds to improvements in the course of our manufacture and in the running of our own mills. The Indian domestic markets will in the near future tend to be so large as to justify our taking more seriously than we have done in the past "mass production," for I am convinced that up to this time, like Lancashire, we have been making too many sorts of cloth in our mills, which in the natural order of things tends towards a decreased all-round efficiency and a lower output.** The pros and cons of automatic *versus* Lancashire looms you will discuss at length, and you will find, I think, that one system is beneficial. for one kind of production, and the other for an entirely different line of manufacture, but there is no doubt that the automatic loom eliminates the "human element" which, owing to labour's lack of appreciation of the science of weaving, produces so many faults in the cloth we manufacture in this country under present-day conditions.

Research and Technical Education

Much has been said about research, and much is now being done in the growing of better cotton and in the scientific handling of it from the raw product to the manufactured article through processes which after all have not seen any revolutionary changes in the last 30 or 40 years. But those days are passing, and as I see it we must encourage and develop institutes where scientists can investigate and solve problems which will help towards better and more efficient courses of manufacture. That is long-term policy, but surely there is a short-term policy too, and that is, every concern should have its miniature research station where problems peculiar to itself can be investigated and solved. I could mention lots of these, but as you know we try to get over these difficulties in a practical way rather than by seeking scientific knowledge.

Technical knowledge and the seeking of it must be encouraged if we are to keep abreast of the changing times. Fundamentally, compulsory primary education of our workers, which would enable them to realize that more efficient work would mean more pay and a better standard of living, would help to solve some of our difficulties, but naturally it cannot stop at that, for spinning and weaving is a science, and those who are to play their part in the various processes through which cotton must pass before it becomes a usable article, must apply their mind and knowledge to the scientific methods which in the passing of years have been evolved; and further, must study methods which might improve or revolutionize those processes. That can only be done by study and training, and therefore the V.J.T. Institute, the Matunga Laboratories and the Technological Departments of our Universities should be encouraged and developed, for in these enlightened days science as applied to industry is more essential than ever.

And now, gentlemen, I must close. As I said at the outset, my remarks must perforce be general, though there is much I would like to comment upon. You of the Textile Association who play a part in the executive administration of large works and great number of workers, must realize that on your shoulders rests some responsibility for the success of the undertaking with which you are associated. **Be sympathetic with your labour and try to train it to realize its responsibilities too—apply your scientific knowledge practically—benefit from your own and other people's mistakes—move with the changing times and aim at producing cloth which can be bought and appreciated by the millions of this country, at a price within their means.**

AWARD OF HONORARY MEMBERSHIP OF THE TEXTILE ASSOCIATION (INDIA) TO DR. NAZIR AHMAD

SPEECH BY Mr. B. M. BORKAR, Spinning Superintendent, Phœnix and Bradbury Mills, Bombay

DR. NAZIR AHMAD, O.B.E., M.Sc., Ph.D., F.Inst.P.

It is my pleasant duty to announce before the Second All-India Textile Conference that the organizing body of the Conference, the Textile Association (India), on 11th January 1945, unanimously elected Dr. Nazir Ahmad, O.B.E., M.Sc., Ph.D., Cambridge, Fellow of the Institute of Physics, as its second Honorary Member. This is an honour for which only one person is eligible during any one year, the first Honorary Member being the late Mr. Cowasji D. Panday, Founder and Managing Trustee of the Panday Textile Trust. In electing Dr. Nazir Ahmad as its second Honorary Member the Textile Association seeks to pay homage to research work in cotton textile technology which is playing and will continue to play a very important part towards further progress and development in the premier industry of India.

After graduating from the University of Allahabad, Dr. Nazir Ahmad proceeded to England for higher studies in Physics and worked for four years under the late Lord Rutherford and was awarded the M.Sc. in 1923 and Ph.D. in 1925. On return from England he was appointed Head of the Science Department, Islamia College, Lahore. He took keen interest in the affairs of the Punjab University and in 1929 was appointed a member of the Punjab Provincial Research Council.

In 1930 Dr. Nazir Ahmad came over to Bombay as Assistant Director of the Indian Central Cotton Committee's Technological Laboratory. In 1931 he became the Director and continues to hold this position ever since. Under his guidance the activities of the Laboratory have expanded in every direction. A full-fledged Testing House, where all kinds of tests on cotton yarns and fabrics are made, has come into existence and these tests have been recognized by the Government of India and by the various millowners' associations. A new ginning section for studying the methods for improving ginning of Indian cottons has been added and extensions have been made in the yarn and spinning sections. It is gratifying to note that some very complicated and delicate apparatus has been evolved in the Laboratory as a result of experiments undertaken at the instance of Dr. Nazir Ahmad and these new instruments have helped in getting correct readings and thus collating very valuable data.

Numerous other investigations into the spinning properties of various cottons, pure as well as in mixture, have been made at the Laboratory and valuable bulletins have been published about high drafting and the utility and efficiency of processing machinery in spinning mills. Dr. Nazir Ahmad is the author of more than 50 technical bulletins or scientific papers embodying the result of these investigations.

Dr. Nazir Ahmad has also taken keen interest in educational and technical matters. He is a Fellow of the University of Bombay, a member of the Board of Management of the Victoria Jubilee Technical Institute and a member of the Board of Visitors of the Department of Chemical Technology. He is also a member of the Advisory Board of the Imperial Council of Agricultural Research and of the Lac Cess Committee and a member of the Council of Scientific and Industrial Research.

During the last three years, he has been a very active President of the Textile Association (India) and was mainly responsible for the annual prize competitions and for the successful organization of the First All-India Textile Conference.

Recently Dr. Nazir Ahmad was selected to be a member of the mission of Indian scientists which was deputed by the Government of India to visit Britain and U.S.A. to observe and report on the latest developments in all departments of pure and applied science. We expect that the observations and the recommendations of this mission will help Indian industry to mobilize all its resources for post-war expansion.

By electing Dr. Nazir Ahmad as an Honorary Member, the Textile Association (India) shows its appreciation of the necessity of harnessing the researches in science to the development of the staple industry of India. Dr. Nazir Ahmad is yet in the prime of life and we all wish him a long and active life for furthering the cause of cotton research to which he has devoted the major portion of his career.

We all miss Dr. Nazir Ahmad at to-day's conference. In his inevitable absence, due to his being detained in Europe for work in connection with the mission of Indian scientists, we have to rest content with conferring the Honorary Membership of the Textile Association on him *in absentia*.*

Vote of Thanks by Mr. D. B. Katrak L.T.M.

You have just heard the instructive speech given by Sir Joseph Kay. There are many important points worth noting and I am sure we make use of the same whenever possible. On behalf of you all I thank Sir Joseph Kay for sparing his valuable time and taking all this trouble for us. When I was young, my father always used to tell me that whenever you want to get any important work done, always approach a busy man, and you are sure that your work will be done efficiently and diligently. Well, that actually happened when we saw Sir Joseph Kay; though so busy, he agreed to inaugurate the Second All-India Textile Conference and Exhibition.

THE HON'BLE JUSTICE SIR HARSIDHBHAI DIVATIA'S ADDRESS

GENTLEMEN,

I have listened with much interest as well as profit to various papers that have been read before us to-day and the general discussion that followed thereon. As you are aware, I am not connected with this industry except as regards the relation between workers and employers. From what I have seen and come to know about this industry on this point, I think this question has to be approached from a double aspect. The twofold aspect from which this question has to be viewed is this: firstly, it must be recognized by all those who are concerned with this industry that the textile industry has remained till now, and will remain in future for a long time, the *National Industry of India*. It has established itself as such at present, and even though in the near future we are bound to have industrialization on a large scale, I believe the textile industry will remain the principal national industry for a long time to come. And, as it is a national industry, it is necessary for all the limbs that form part of the textile organism—I prefer to use the word organism instead of industry—to be well looked after. Just as the health of every body depends upon the healthy activities of its limbs, it is the health or the well-being of each limb of the industry that affects the other components of the industry.

The second standpoint from which this question has to be reviewed is this: India is one of the poorest countries in the world. There are millions in India who cannot even afford to buy the necessary quota of cloth which are required to cover their bodies and the members of their family and it is, therefore, necessary that the question of consumers of cloth of this industry must be kept in the forefront in any discussion regarding the inter-relation of the several elements that form the textile industry. In other words, as a national industry it has not simply to provide cheap cloth for the people of India, but it has got to increase production of different kinds of cloth for consumption in India and abroad. So, what we really want is not only increased production, but also cheaper production for the

---

* Dr. Nazir Ahmad has since returned.

The Honourable Justice
Sir Harsidhbhai Divatia, M.A., LL.B., Kt.

people of India. It is that aim which the employers as well as workers have to keep in mind. Then we come to the subject of the wages of the workers and the various welfare measures which are required for them. Finally, for disputes about wages and conditions of work, we require legislation and Industrial Courts.

One thing we must always keep in mind is that employers as well as workers are trustees for the large mass of the public which forms the consumers of cloth in India. The consumers, meaning the public, are represented by the State, i.e., the Government of the country. It is, therefore, necessary that the Government as representing the public and the class of consumers as a whole must so regulate the industry that it must, with all its component parts, work harmoniously for the benefit not only of the industry, but also of the country.

At one time it was thought by employers and industrialists that in order to work a concern successfully and prosperously, it was necessary to have cheap capital and cheap labour. It has, however, come to be recognized now that cheap labour, which really means inefficient labour, is dear in the long run. What is really required, therefore, is not cheap but efficient labour and it is from that standpoint that we have to approach the various measures for the welfare of workers. We can obtain efficient labour by making our workers educated, healthy and contented. These are the three words in which I can summarize all the welfare measures which can be embodied in legislation relating to the workers.

All-India Legislation Wanted

So far as India is concerned, you are aware, and several speakers have laid stress upon it, that there are different provincial enactments for that purpose. What we, however, require is an all-India legislation concerning the relations between employers and workers in the textile industry. That legislation should, in my opinion, apply not merely to textile concerns in British India but should also apply to all textile concerns in India, including the Native States, because, as most of you are aware, the conditions in Native States and the conditions in British India act and react upon each other and there should be a uniform policy for all units in the Indian textile industry. In my work in the Textile Labour Inquiry Committee I was impressed with the genuine grievance of the employers that they cannot compete with the mills in the neighbouring Native States where wages were low and workers' welfare measures were practically non-existent. The result was that the cost of production in our mills was much more than the cost of production there. I therefore lay stress on the necessity of not merely a British India, but an all-India, legislation in matters which should regulate the relations between employers and workers.

Arbitration—Compulsory or Voluntary?

One thing which has come for discussion to-day is the question of arbitration. One of the members of the Conference has raised an important question as to whether arbitration should be compulsory or voluntary and a reply has already been given by one of the speakers, that in order that arbitration should work to the satisfaction of both sides, it must predominantly remain voluntary. No doubt there may be extraordinarily critical times when the interest of society itself would require that the troubles between the employers and the workers, if they do not agree, should be solved by the public in the interest of the State. You know the time when there was a general strike of railways in England in 1926. When this strike was there, the public co-operated with the Government in order to put down the strike which was considered to be without justification. Now, in such cases if the Government and the public think that the employers and the workers would not come to terms with one another, and that if it is protracted it is bound to prove ruinous to the public, it is, I think, the duty of the State to interfere and provide compulsory arbitration in such cases. You know that in the Bombay Industrial Disputes Act, although the general provision is that the arbitration must be voluntary, it has been found necessary on extraordinary occasions to have compulsory arbitration, but very great care should be exercised before forcing any sort of compulsory arbitration upon the parties, and that should be regarded as the last stage.

Extract from Message of
Sir H. P. Mody, K.B.E., Bombay.

"*The subjects for discussion are important and complex, and while they may provoke a variety of views, their ventilation in public can do nothing but good. Those in control of industry in India cannot afford to be insensitive to the tendencies of the age, and must not fail to acquire a progressively enlightened outlook in matters of labour welfare and labour legislation. Suitable working conditions and efficiency of management are also matters of vital importance to industry. . . .*"

I do not desire to speak at length on the various welfare measures which have been referred to to-day. We have dealt with them sufficiently and I believe exhaustively, in the Report of the Textile Labour Inquiry Committee, in which all these questions have been dealt with. I do not think I can add usefully to anything that has been said. I will, however, refer to one or two aspects of the question that have been agitated to-day, and one was the question of wages on the one hand and welfare measures on the other. One of the speakers, I believe, said: What is the use of referring to welfare measures before first of all regulating wages? There is, no doubt, a good deal of truth in this criticism. You must first of all give the worker a living wage, i.e., a wage on which a family of four can live, whatever that amount may be in a particular Province or State. One thing is certain, that it is the duty of the employers first to give such wage to the workers as would be regarded as a sufficient living wage and it is thereafter that measures for social welfare should be taken.

"Outsiders" in Labour Unions

Now, there is one more question, and that is the very important question in connection with the disputes between employers and employees. As you are aware, in all questions of dispute between the employers on the one hand and the workers on the other, the parties are not evenly and equally matched. In some places, employers are highly organized; they have got their own associations, they have got their legal advisers, and so on. The workers, as you are aware, are not sufficiently organized and generally they have not among themselves a person who can guide them in their disputes, with the result that for some time to come at least, outsiders will have to take part and help the workers, but I hope that the day may come soon when the leaders of the workers and of the trade unions, would arise from the workers themselves, so that no outsiders or interested parties can exploit the workers as against their employers. It is necessary, therefore, to educate workers themselves to help them. It is the duty of the employers to help

Extract from Message of
Mr. Ambalal Sarabhai, Ahmedabad.

"*There is a lot that remains to be done in respect of labour welfare and efficient management. But the problems of our country are different from those of others and taking for a model a country like England, which is mainly industrial, will not suit Indian requirements and conditions. Labour being cheap so far, little attention has been paid in rationalization of work. Other countries are far in advance in this respect and so also in conditions of work and housing. I do hope that the consideration of these and other important subjects by your Conference will be helpful. . . .*"

them in forming trade unions. If that is done, some sympathy and goodwill is bound to be created between employers and workers. In this connection, a reference was made by one of the speakers to a scheme which has been adopted in the Delhi Cloth Mills. About four months ago, I had an opportunity to visit Delhi and to see the various welfare activities that were being pursued in that mill. I have read the scheme in connection with the Trust, of which something has been said. I do not know the inner working of the Trust, but I am sure that if the provisions of that Trust are being carried out I think it is a great scheme which employers not merely in textile industries, but in other industries might very well copy. (Cheers.) I was told, also I read in the memorandum of agreement, one thing which seems to be quite exceptional, that is, that one of the workers was made a member of the Board of Directors. (hear, Hear.) In this respect this concern has certainly gone a great way in giving an example to employers in India. I was told that for some time past there was no strike in the Delhi Cloth Mills. I am not saying that this is the only mill which has done something genuine for the workers. I have visited almost all the mills in the Bombay Presidency, and I have found that the employers themselves are very anxious that their workers should be efficient and in order to make them efficient they have tried to provide various welfare measures. I do not entirely blame the employers if they have not carried out all that is necessary, because in some cases, when there have been upheavals in the industry, it is very difficult to spare money for certain necessary measures. You know all employers are not of one type but I believe that the employers generally recognize the necessity of running the industry in a smooth and efficient manner by reducing the grievances of the workers. Legislative measures to protect the employers as well as the workers will always remain necessary, but much depends upon the employers and workers themselves to make such measures successful.

I was much impressed with one of the papers read to-day, i.e., by Dr. Joglekar. I endorse what he has said, because I have seen myself all those things when I visited the mills in the Bombay City. In fact, there was no organization for medical relief and I hope that the paper that he has read before you to-day will be given effect to by all the employers of the industry.

One of the speakers has rightly observed that legislation, industrial and labour legislation, must not be for the benefit of one party, but it must be for the benefit of all the parties or all the persons concerned. I entirely endorse it. There is a belief, at least in some quarters, that legislation is only for the welfare of the workers and it is also believed in some quarters that even Arbitration Courts are inclined more towards labour than towards employers. Speaking personally, gentlemen, I can say that so far as our Industrial Court is concerned, we have always kept before us the ideal of the welfare of the industry as a whole in deciding all disputes. Employers as well as workers must receive a fair deal from the workers, but our main aim has been to enforce upon courts which must have before their minds the welfare of the industry as a whole. (Cheers.) As I said before, not only is production to be increased, but the cost of production is to be cut down and the employers as well as the workers should fully co-operate in the manufacture of more as well as cheaper cloth not only for the benefit of themselves, but for the benefit of consumers also. Therefore, it is the duty of the employer to do all that he can for the satisfaction and welfare measures of the workers. It is equally the duty of the workers to be as efficient as they can when they are paid properly and when their needs are looked after by Government. In my experience, if the average Indian worker is properly trained and treated, he will not be less efficient than an average worker in the West, making allowance, of course, for the difference in climatic conditions.

Although a number of industries may be newly introduced in our country after this war, the textile industry will remain predominant. But, the competition between the Indian textile industry and the textile industries of foreign countries is also bound to increase in course of time, and it is necessary that all those who take interest in the welfare of our textile industry should contribute not only for the preservation but also for the progress of that industry.

ADDRESS BY SHETH RAMNATH A. PODAR

SHETH RAMNATH A. PODAR

MR. NANDULAL MEHTA, LADIES AND GENTLEMEN,—It is a fact that the fag end of a three days' conference is no occasion for any oration, let alone my own disinclination; nevertheless, the tendency to be loquacious on the particular occasion, when the curtain is about to come down on the last scene of the great war, is irresistible for me, as it may be for any one of you. I shall, however, be careful and shall not allow my enthusiasm for speech-making to overstep the bounds of the real necessities of the case.

First of all, I must congratulate the organizers of the conference, for not only do these conferences serve to focus attention on matters of immediate importance to the industry, but also afford an open forum for technical men of long and varied experience to come forward and state their views on these matters. The conference which is now concluding its session will go down in the annals of the Association as an epoch-making event in the sense that, more than any other conference which may have preceded it or may follow it in future years, it discussed and formulated views on the post-war reconstruction of the industry, and I have no doubt that at the appropriate time the views you have expressed here will receive proper consideration at the hands of those who will be responsible for the ultimate realization of our post-war plans.

Our preoccupations should not be allowed to divert our attention from the real needs of the industry. No doubt the conference has indicated the broad directions in which future progress lies, but I think the stage has been reached when all those whose livelihood depends upon the industry, irrespective of their status, should say less and do more.

I was disappointed to a very great extent at the absence from the conference of the top men of the industry in the city and their lieutenants, but I am very pleased to note that representatives of mills in up-country centres, regardless of all the inconvenience provided by our national railways, have taken the trouble to be here in large numbers. Let me hope that in the conferences to come the organizers will have the pleasure of meeting here not only the mill executives and technical assistants, but also mill agents and financiers.

Post-war Programme

I would now classify our post-war programme under the following broad heads:—

(a) Reorganization and re-equipment of the industry.

(b) Establishment of an industry for the manufacture of mill machinery and spares in India.

(c) Establishment of an industry for the manufacture of mill stores, including dyes, in India.

(d) Establishment of trade and technical schools which would form a reserve from which mills could draw their requirements of labour and supervisory staff.

(e) Establishment of a central research institution on the lines of the Shirley Institute for promoting research in all branches of the industry.

On paper, the whole thing appears to be very much outside practical politics for us, but it is my humble view that with the necessary financial and moral support from all parties, a beginning can be made and the objectives obtained within a fairly reasonable number of years.

Problem of Re-equipment

Under every one of the above heads, there is a great deal of work to be done by technical men, such as members of your Association. Your Association should, however, first take up the question of re-organization and re-equipment of the industry. I must here digress a bit. The new provisions for depreciation for building, plant and machinery which the Finance Member has announced to-day as part of his budget proposals are, indeed, to say the least, intriguing. Placed as we are in utter dependence of foreign imports for all our equipment, one is entitled to question the wisdom of such wholesale renovation as the Government are probably anxious to accelerate at this period of war. I am second to none in my enthusiasm and anxiety to have for our country's industries nothing but the most modern equipment, but are we to understand that ours is the only country to be producing war requirements and other countries have no concern with war and have enough time to produce our capital requirements? I am afraid if the Grady Report had not been shelved we may not have had to face such a situation as is obviously developing in regard to the equipment of our industries in the post-war period. How can we be sure that, for the capital requirements of our country in the shape of machinery and tools, we could safely depend upon foreign manufacturers who are no less torn than we are by war-time conditions and whose stocks and quality of raw materials must be as limited as elsewhere? We see no doubt their anxiety to switch over their war-time factories to the production of other types of goods for the purpose of regaining their hold on foreign markets, but surely with a little forethought we could have provided ourselves against this contingency and even now, gentlemen, I think it is not too late to apply our minds seriously to the production of goods needed for the re-equipment of our industry. I hope, gentlemen, you, whose main concern is looking after the equipment of the industry, will give serious thought to this question, viz., that in re-equipping the industry there is an all-round improvement in the country's economic condition.

Challenge of Synthetic Fibres

I do not think anybody can quarrel with the above objectives, but what is wanted is a blue-print, clearly explaining how and in what stages these objectives are to be attained, and the industry is entitled to look upon members of your organization to give a proper lead. In welcoming the delegates to the conference, Mr. Nandulal, if I remember correctly, expressed grave doubts as to whether King Cotton will continue to hold his sway in the textile industry of the future. Though I am not as diffident as Mr. Nandulal appears to be, yet I can foresee a serious challenge coming from synthetic materials which we can no longer ignore, as it is inextricably bound up with the question of price at which we can finally market our goods. In India, however, we have a duty to the grower of cotton and I do not, therefore, think that we can in this particular sphere go so far as those countries who are not themselves growers of cotton. It is, therefore, my earnest desire that you, gentlemen, should resolve yourselves into sub-committees or study groups, each group undertaking the responsibility for the formulation of definite plans so that when the time comes, these plans may be given due consideration and sufficient weight by those who would be ultimately responsible for the post-war rehabilitation of the industry.

Extract from Message of
Mr. M. K. Vellodi, C.I.E., I.C.S.,
Textile Commissioner, Bombay.

"*The pioneers of this industry had to tread a very difficult and uphill path against severe competition from countries outside India and that it has in the teeth of such competition been brought to its present eminence is a standing monument to the perseverance, the untiring efforts and of the integrity of these pioneers of the industry. We have still among us some of these veterans like Sir Ness Wadia, who continue to exercise a paternal care over its fortunes and whose example the rest of the industry would do well to follow. The war has brought in its train various problems, the most important of which appear to me to be the rehabilitation and the expansion of the industry during the post-war period. Conferences of the type that is being held under your auspices will contribute, I trust, very largely to assist in affording solutions to these problems. . . .*"

Labour's Responsibility

I have learnt with considerable interest of the discussion which took place at the conference on labour problems. The Millowners' Association, of whose Committee I am a member, has already taken an active lead in this matter. I should concede at once that there may still be some room for improvement, but the Association has committed itself to a policy of fair deal to labour. I must at the same time desire it to be known that it cannot always be a one-way traffic only. Labour, as an essential part of the industrial organization, must realize its own responsibilities and co-operate with the employers in all reasonable measures, having as their objective the rehabilitation and reorganization of the industry to meet the post-war world competition, and you, gentlemen, who rub shoulders with our labour force every day would, I am certain, be able to give us valuable advice as to how this happy state of affairs can be brought about.

> **Extract from Message of**
> **Sir Sorab Saklatvala, Kt., Bombay.**
>
> *"I have no doubt the Conference will have the benefit of the views of technical men on the recommendations of the U.K. Textile Mission which visited the United States of America last year and their applicability to the Indian Industry. Labour problems will, I am sure, also form the subject of discussion. We have hitherto not paid sufficient attention to labour welfare from psychological point of view and the subject requires careful study. I think a recommendation might be made to other provinces to initiate labour legislation on the lines of the Bombay Industrial Trade Disputes Act unless the Central Government enact similar legislation on an all-India basis. . . ."*

Future of the Industry

Gentlemen, one or two matters more, and I shall have finished. Various authoritative pronouncements have already been made about the future of the industry. I grant that a great deal depends upon the continuation of the present controls, an integral part of which is the fixation of prices for our cotton goods. You will, however, agree that **for some years at any rate after the termination of the war, supply of cotton goods will not be able to keep up with the demand, and in this view of the case, some sort of control on an international basis both in regard to distribution and prices should continue in the interests of humanity. India has a place among the nations of the world and consistent with the industry's responsibility to Indian nationals, I think we should be prepared to render all possible contribution to any world scheme for the supply of clothing to humanity at large. This transitional period will necessitate continuance of production at the present high, or even higher levels, coupled if necessary with a lower rate of capital realization on humanitarian grounds. This sacrifice is well worth making, in the interests of humanity at large, but at the same time I want you to realize that we must prepare ourselves for the day when India will be called upon to compete in its home and export markets against strenuous competition from other textile producing countries in the world.** I naturally hate to believe that this competition will drive us back to the depression through which we passed in the pre-war period, but I sincerely feel that with the experience which you have gained it will be possible for us to steer clear of the troublous years through which the industry passed after the last war.

> **Extract from Message of**
> **Mr. K. M. D. Thackersey, Bombay.**
>
> *"If our industry is to exist in the post-war period as an economic and efficient unit, holding its own against foreign competition both in India and abroad, then the time has arrived when we must take note of the extent to which preparations are being made by other competitors, both prospective and otherwise, and also make our own plans. The Report of the Platt Committee which was recently published calls for a complete and thorough revision of our ideas as regards industrial efficiency and I sincerely hope that these and other cognate matters will receive the most careful and exhaustive examination at the Conference. . . ."*

In conclusion, let me once again thank the organizers of the Conference for the honour they have done me in inviting me to accept the chairmanship of the conference in its concluding session. Let me also wish the Textile Association and its members prosperity in future. Let the organization grow from strength to strength until it comprises all the technicians employed in the entire Indian cotton mill industry. Your collective wisdom and practical experience would then be a great asset to the industry to which we all have the honour to belong. I face the future with a feeling of optimism, for apart from other things, it is my honest conviction that the salvation of the Indian textile industry can be chalked out and attained by local talents without the aid of imported brains. It should, indeed, be a shame for any country if it has to depend upon foreign technical skill for such a large industry as ours which was established more than a hundred years ago. I am sure you will all tackle this problem most seriously and give to the industry its entire technical personnel with nothing but the most up-to-date modern ideas.

Before I sit down, I must pay a personal tribute to Mr. Nandulal, Mr. Katrak, Mr. Ullal, Mr. Vaidya and their band of workers for the care with which they have arranged the details of the conference and the exhibition, and the success which the Textile Association has met with during the comparatively short period of its existence is, I can say, in no small measure due to your personal efforts.

SPEECH OF Mr. G. S. KAPUR, L.M.E. (Hons.), L.E.E. (Hons.) Eng.

GENTLEMEN,

Mr. Ajgaonkar gave you a detailed description of humidification and Mr. Shah gave you a description about what certain humidification plants can do. Well, as somebody said, the engineer does not know anything of humidification. To a great extent he is right and I think the sections who want to use humidification are responsible for the Engineering Department being indifferent towards humidification. More often it happens like this : certain sections want a particular type of humidifying plant. It must be discussed and and ought to be discussed with the engineer and the pros and cons of it should be studied before ordering out a plant. The sectional heads or the sectional officers order out the plant and dump it on the engineer to work it for good or bad. While ordering they say that the suppliers know what they are supplying. But, the suppliers never care to cater for the maintenance and for the proper working of the plant. That has been my bitter experience. Another thing is, I think many of our mills have grown and not planned. Many of our mills have started as small units and then gone on adding and adding. The plant that you may have got for a certain unit may not be sufficient when you expand. The departmental heads say that they have supplied the plant and ask the the engineer to work it. Therefore, when you order out a machine it is better to order a humidification plant also.

While humidifying a shed the sectional heads are only concerned mostly with what they want for the machine. If the Engineer wants to change over the air margin they will say, 'Oh, you admit extra air, it spoils my humidification ; so don't take in extra air.' That means they expect the engineer to do the churning of it and not the changing over of the air.

Technicians turned actors

The first thing that you will find generally when you go into a weaving shed is that people who are not accustomed to the atmosphere of the shed will say 'Oh, what an atmosphere! What have the departmental heads done to remove the odours? It is most injurious to the people'.

About the variation of the humidification, I think that while ordering out a plant, taking into consideration that the mill is not going to ossify but to expand, it would be right to order out a humidification plant and air circulation plant. It would be better to order out a 200 per cent. size plant in the beginning. The employers do not want to spend on humidification as the Engineering Department is not a money-producing section. Odour should be removed first and then the air-conditioning plant installed as it will make a lot of comfort to the workers.

As regards humidification, there are two or three systems working, overhead and underground. One of them will supply about somewhere between the roof and the ground level. But we want a combination of these if you want a perfect plant. While putting the underground plant, they put in a few ducts and say they have done it. Of course, the caterers say, 'You put the plant: it will be all right'. That is not sufficient. You must do something more. Instead of a few ducts, the whole floor of the weaving shed should be a net- work of ducts. It is a suggestion I am making. In a large shed the caterers put some ducts at one end and they expect a uniform humidification to the other end of the shed. I find it does not work. What they will have to do is to use a sort of feeder system extra. The tunnels should open at particular places in the interior of the shed and from them it should radiate modified air. Before doing anything a series of readings should be taken, preferably by automatic recorders in

Extract from Message of
Mr. G. D. Birla, Calcutta.

"*How to improve the efficiency of the industry and also of the workers, what improvements there should be in labour legislation, what is the duty of the employers and the State towards labour welfare work, are all important questions which I am glad to note you are going to discuss and I hope that the deliberations of your conference will be a source of enlightenment to the employers and employees. . . .*"

Extract from Message of
Mr. B. W. Batchelor, Madras.

"*I hope that the Conference will arrive at conclusions on subjects which will find application and acceptance throughout British India and Indian States and that it will be generally recognized throughout the cotton textile industry that if post-war conditions are to be at a socially desirable level, common aims and a common policy on an all-India basis, and particularly on these subjects are necessary for the industry's sound and healthy development. . . .*"

different sections of the same shed for a year at least. So, humidification is not a point which can be settled offhand in a few days or months. It is to be properly designed and carried out. It is a very wide subject which cannot be tackled in a few hours or months. Enough data should be collected from the users of the plant about the difficulties, maintenance, etc. and patiently sorted out. The Association, I think, will be quite willing to spend some money on printing all these detailed data. Certainly the work will be taken up by the Association, but all of you should not forget that you are the Association and that you have to do it. It is very easy to criticise, but very difficult to do a thing. Unless every one of you do the work of collecting the data, it will be very difficult for the management.

Speech of Mr. D. L. SEN, M.Sc. Tech. (Manc.), M.Sc. (Bom.), A.I.I.Sc., F.I.C.

FRIENDS,

We had a very interesting time. We thought people are not interested in fibres. But, now, after all these four papers, everybody has taken keen interest, and I am sorry, Mr. Richardson (who was to read the fifth paper), although he had come to Bombay, could not bring his original papers and he could not be present.

Mr. Nanjundayya in his paper has given us a very vivid picture about the growth and structure of the cotton fibre. I can assure you there will not be much competition from synthetic fibres. We are not yet familiar with all the chemicals in the processing of this fibre. But, as Mr. Borker said, if we succeed in producing synthetic fibres in an appreciable quantity we can reduce our cotton acreage and use our fields for growing foodstuffs which are so badly required. Food is our first concern. So I think the Indian Central Cotton Committee and the Government of India are moving in the right direction when they endeavour to manufacture synthetic fibres. As Mr. Gulati suggested, there is a good market for synthetic fibres and in my opinion, there is no harm in promoting and developing the fibre industry. There is no need to have any apprehension regarding the safety of cotton. We have such a large supply of cotton and at times we find it difficult to dispose of all our cotton. Sometime back the Indian Central Cotton Committee were actually carrying on experiments to find ways and means to utilize the extra cotton. It was in Alexandria that I first saw cotton fabrics being used in making roads. After putting several layers of cotton fabrics, they are tarred, and it seems once roads are prepared like this there is no necessity for any repair, and accordingly our Technological Laboratories is experimenting on this, and has actually prepared a road in Matunga. It was nearly four years ago, and no repairs have been yet made. We have to make use of these methods in order to utilize our short-staple cotton. In our laboratory we are making a survey of the raw materials from which synthetic fibres could be had. It has been found that lots of raw materials which hitherto had been utilised only for making wood-pulp are quite good for manufacturing synthetic fibres.

Mr. "Friends"?

The most popular figure at the Conference—an expert photographer, amateur comedian, former spinning master, now labour officer—everyone is looking forward to meeting him again next year.

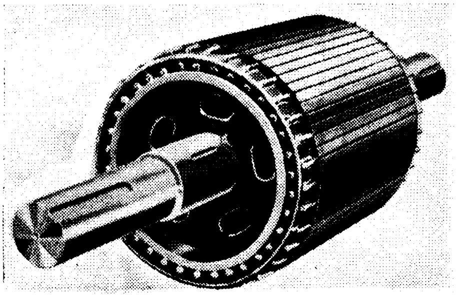
All pictures of the Conference and the Exhibition have been taken specially for the "Indian Textile Journal" by the well-known photographers MESSRS. DEVARE & CO., *Cutch Castle, (opp. Royal Opera House), Sandhurst Bridge, Bombay.*

Newman Electric Motors

A Totally Enclosed British Motor Notable for Compact and Robust Design

A LAYMAN looking through the catalogue of an average electric motor manufacturer is amazed and mystified by the number of different types of motors offered. Open-end bracket, protected, screen-protected, drip-proof, pipe ventilated and totally enclosed are shown with little, if any, guidance as to where and when these different types can or should be employed.

Even an engineer, before he can choose with certainty the most suitable type, must have full knowledge of the conditions in which the motor will be required to operate. Frequently, however, he may be called upon to supply a motor without precise information as to the operating conditions, the exact cycle of duties and the maintenance, if any, that will be given to the machine.



This Double Cage Rotor is fitted on all Newman Type D Electric Motors from 5 h.p. at 480 r.p.m. to 25 h.p. at 1,460 r.p.m. giving slip ring performance with squirrel cage simplicity and reliability.

Life-long experience of such problems, therefore, prompted the designers of Newman motors (proprietors: Newman Industries Ltd., Yate, Bristol, England,) to develop a single type which would be suitable for almost any application irrespective of the working conditions.

Exhaustive research and experimental work resulted in a final choice of a totally enclosed fan cooled design and a new factory was erected at Yate, Bristol, early in 1938, equipped with the most modern precision machinery specially chosen with a view to the most efficient production of this one type.

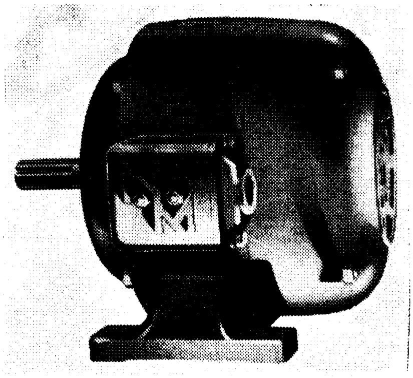
By concentrating on this one type within a range limited to the outputs in most frequent demand, it is produced at a price which compares favourably with older and more vulnerable designs, and the success of this policy is reflected in the continual expansion of the original plant.

Only the finest quality materials are used in the manufacture of Newman motors and these, fashioned to a careful but almost revolutionary design, have made available a motor no larger than the ordinary protected machines, but with windings and bearings completely enclosed, and having technical characteristics well above the average.

Newman motors can safely be installed in dusty, damp or chemically laden atmospheres. They can be mounted on any part of a machine close up to the work, thus saving floor space, eliminating belting and reducing transmission losses.

Their performance is such that they can frequently be used in place of "high torque" motors, whilst the exceptionally high power factor and efficiency, especially on partial loads, will usually effect a considerable saving in current consumption. All type D motors, ranging from 5 h.p. at 480 r.p.m. to 25 h.p. at 1,460 r.p.m. are fitted with double cage rotors as standard, giving performance equivalent to that of the more bulky and complicated slip ring motors with the simplicity and reliability inherent in all squirrel cage motors and star delta starters.

Reliability and economy characterize the performance of Newman motors throughout the range. No desirable quality has been overstressed to the detriment of others, but all are well balanced to ensure long trouble-free service with a minimum of maintenance even under the most difficult conditions.



Modern and compact design of Newman Totally Enclosed for Cooled Motor.

Newman motors are represented in Bombay by **M. H. Dinshaw & Co., 47, Apollo Street, Fort, Bombay,** and in Calcutta and Madras by **the East Asiatic Co. (India), Ltd., 28, Dalhousie Square, West Calcutta, and Mercantile Bank Building, 1st Line Beach, Madras.**

The wrestlers, who participated in the bouts, with Sir Victor Sassoon, Bart., in the centre.

Fifth Annual Inter-mills Wrestling Tournament, 1945

THE Millowners' Association, Bombay, has been organizing an annual All-India Inter-Mills Wrestling Tournament for cotton mill workers since the year 1941. The finals of the Fifth Annual Inter-Mill Wrestling Tournament were held on Sunday, 11th February 1945, on St. Xavier's College Gymkhana Grounds. Over 180 competitors participated this year in the wrestling events on behalf of cotton mills in Bombay and up-country. During the first three years, there were only four classes and four championship shields in the Wrestling Tournament. Last year, an additional class, viz., the fifth class, was introduced, and this year, two additional classes, viz., sixth and seventh, were introduced. The classification, according to weights, is shown below:—

Class 1	..	Not exceeding	seven stones.
,, 2	..	,, ,,	eight stones.
,, 3	..	,, ,,	nine stones.
,, 4	..	,, ,,	ten stones.
,, 5	..	,, ,,	eleven stones.
,, 6	..	,, ,,	twelve stones.
,, 7	..	Exceeding twelve	stones.

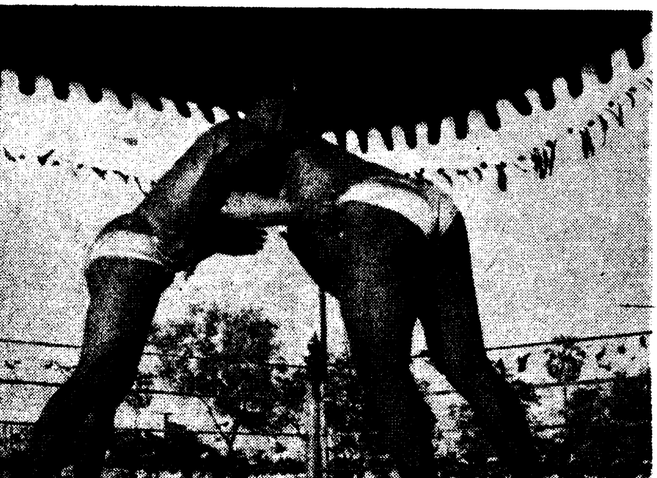
Cash prizes of the value of Rs. 200 and Rs. 100 were awarded to each of the champions and runners-up respectively in all the seven classes.

The Association has provided rolling trophies for each class in the shape of large silver shields. The mill to which the champion of each class belongs is also awarded a silver replica of the shield.

In addition to wrestling, several sporting events like long jump, high jump, 100 yards flat race, and half a mile flat race were also included in the tournament, as was done last year. This year, 126 workers participated in the sporting events as against 120 last year. Two more new events were introduced this year, viz., volley ball and tug-of-war. Seventeen mills participated in the tug-of-war matches while sixteen mills competed for championship in the volley-ball matches. A sum of Rs. 15 was awarded to every player in the teams which won the tug-of-war and volley-ball tournaments, and a prize of Rs. 10 was given to every runner-up.

The eliminating bouts in the wrestling tournament were started simultaneously at four different centres—David Mills, Morarjee Goculdas Mills, Khatau Mills and the Century Mills—on the 22nd January 1945. The semi-finals were held at the Morarjee Goculdas Mills on the 30th and 31st January 1945. The volley-ball matches were played on the 4th, 5th, and 6th February 1945 at the Dawn Mills while the tug-of-war was held on these days in the evenings on the playground of the King George English School, Dadar. Competitions in the other sporting items were held in the mornings of the 7th, 8th and 9th February 1945 at the St. Xavier's College Gymkhana Grounds when the final match in the tug-of-war was also held.

The programme of the wrestling finals began exactly at 5 p.m. on Sunday the 11th February 1945, at the St. Xavier's College Gymkhana Grounds, on the arrival of Sir Victor Sassoon, Bart., who was invited to preside over the occasion. It was a holiday for all mills in Bombay on account of *Mahashivratri*, and large crowds of mill operatives and others interested in the tournament started



The "Heavyweights" in action—Left 174 lbs. vs. Right, 192 lbs.

Siddappa of the Gokak Mills (left) and Tukaram of the Gold Mohur Mills (right).

Sir Victor Sassoon, giving away the prizes to Tukaram Nanasaheb, Champion Wrestler.

pouring into the grounds much in advance of the appointed time as there is no doubt that wrestling is still a popular sport with the cotton mill workers in Bombay. There were also several distinguished spectators who had come in response to invitations. Immediately on the arrival of Sir Victor Sassoon, the wrestlers were introduced to him and a group photograph was taken. The wrestlers looked living specimens of exuberant health and vivacity and their shining skins and enviable contours were eloquent testimony to the care they had taken to keep themselves in fighting trim even after a day's toil for their daily bread.

The first event was an exhibition bout between Nana Tukaram of the Edward Textile Mills and Shankar Dnyanoo of the Sassoon Spinning and Weaving Mills. Then began the fight for Class I championship between Ramchandra Baburao of the Sholapur Spinning and Weaving Mills and Mahadeo Narayan of the David Mills. Though both of them demonstrated considerable skill, Ramchandra Baburao emerged victorious. The bouts in Classes III, IV, V and VII proved very interesting. Sitaram Bhagoji of the Podar Mills defeated Bhagwan Eknath of the Sholapur Spinning in Class III. The fight in Class IV, in which Ambadas Maruti of the Sassoon and Alliance Silk Mills opposed Laxman Maruti of Modern Mills No. 2, proved very exciting. As the first round of ten minutes proved inconclusive, they fought extra time when Laxman Maruti, who was the champion last year, made short work of Ambadas Maruti. The referees paid a glowing tribute to the skill displayed by Ambadas Maruti. Namdeo Bayaji of the Svadeshi Mills completed his hat-trick this year by defeating Shampyar Bhagan of the Kamala Mills in Class V. Namdeo Bayaji has been the champion in his class since 1943. The fight in Class VII between Sidhappa Bharma of the Gokak Mills, who was the champion for the last two years in his class, and Tukaram Nanasaheb of the Gold Mohur Mills, was probably the most important and interesting event in the programme of that day. Sidhappa Bharma, who had already established his reputation as an unbeatable wrestler by defeating his opponents in the last two years, had this year to fight an opponent who had also made his name as a champion wrestler. It was very hazardous to speculate as to who would win the bout. As they entered the arena amidst cheers, all eyes were centred on them. Sidhappa tried his best to bring about the down fall of his opponent who, however, proved to be more than a match for the former. Sidhappa had the mortification of being beaten by a superior opponent in Tukaram Nanasaheb. The champion was loudly cheered, and in addition to the prizes given by the Association, several spectators gave personal prizes to Tukaram.

The panel of referees which comprised such brilliant people like Prof. Kale of the Samarth Vyayam Mandir, Dadar, and Abasaheb Jog of Baroda, paid a tribute to the skill displayed by the wrestlers that day and were of the opinion that the wrestling was decidedly of a very high order.

After the finals, cash prizes, silver replicas and shields were awarded to the champions and cash prizes were awarded to the winners in other sporting events by Sir Victor Sassoon. After a short speech by the President, the Chairman of the Wrestling Tournament Sub-Committee Mr. Nandulal Mehta, thanked him in suitable words. On the conclusion of the function, enthusiastic supporters of the champions took them and their shields in procession to their respective mills.

The results of the various events are given below:—

WRESTLING

Class		*Mill.*
I. Ramchandra Baburao	..	Sholapur Spg. & Wvg.
II. Babu Govind	..	Gold Mohur.
III. Sitaram Bhagoji	..	Podar.
IV. Laxman Maruti.	..	Modern No. 2.
V. Namdeo Bayaji.	..	Svadeshi.
VI. Bhawoo Rawoo.	..	Khatau.
VII. Tukaram Nanasaheb.	..	Gold Mohur.

Winners of the Tug-of-war Tournament: The Swadeshi Mills team, Kurla. Mr. Sahni, Labour Officer, Swadeshi Mills, is standing at the extreme left.

SPORTING EVENTS	*Winners.*
(1) Tug-of-war ..	The Svadeshi Mills.
(2) Volley-ball	The Dawn Mills.

iii. Polly Brass ..	Kohinoor Mills.

"Shashtyabda Poorthi" of Trichur Millowner

Cochin Dewan Unveils Portrait

THE Directors, staff and operatives and the constituents of the Sitaram Mills Ltd., Trichur, and the Managing Agents, Messrs. T. R. Anantharama Iyer and Bros., Ltd., Trichur, celebrated the "Shashtyabda Poorthi (sixtieth birthday) of Mr. T. S. Balarama Iyer, B.A., Managing Director, on Wednesday, 10th January 1945, in the mill premises. The function was presided over by Sir G. T. Boag, K.C.I.E., C.S.I., Dewan of Cochin.

Mr. T. S. Balarama Iyer was profusely garlanded and taken in procession from his bungalow to the mills, where there was a big gathering awaiting his arrival. In his characteristic manner, being a staunch devotee of Sri Sitaram, he directed his car first to the Sitaramaswami temple in the nearby village for worship, before proceeding to the mill premises where the Directors and the elite of the town gave him a warm reception. On the arrival of Sir G. T. Boag, the Dewan, light refreshments were served to the guests and the function commenced with welcome songs by the girl employees.

On account of the great popularity of Mr. Balarama Iyer, it was a huge gathering of distinguished personages of the locality, officials and non-officials, and commercial magnates from all parts of the Cochin State and the presidency of Madras. The gathering included the faithful operatives and staff also.

Mr. P. D. Asher, leading cotton merchant of Tirupur and one of the directors of the mills,

Photograph of the Winners and Runners-up who took part in the Mill Sports on the occasion of the "Shashtyabda Poorthi" celebration of Mr T. S. Balarama Iyer, B.A., Managing Director, Sitaram Mills (who is seated in the centre).

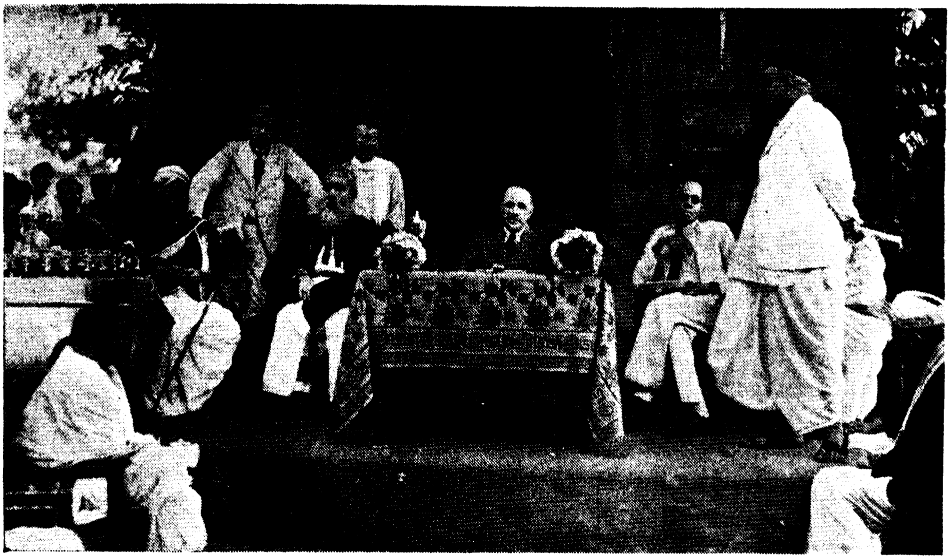

Photo taken on the occasion

Sitting on the dais from left to right:—Mr. T. S. Balarama Iyer, Managing Director; His Grace the Bishop of Trichur; The Dewan of Cochin, Sir G. T. Boag, K.C.I.E., C.S.I.; Dr. R. M. Alagappa Chettiar, Ph.D., Proprietor, the Alagappa Textiles, Pudukad, Trichur; Mr. C. S. Sankara Menon, Chairman, Board of Mill Directors.

Standing on the right and delivering address is Seth P. D. Asher, Proprietor, Asher Textiles, Tirupur, one of the Directors of the Mills.

Sitting on the bottom right with turban is Shree T. K. Kodandarama Iyer, the Manager and Agent of the Mills.

delivered a welcome address on behalf of the mills. Prizes were distributed to the winners in the mill sports.

Addresses were then read on behalf of the directors, the constituents, and the members of the staff and operatives of the mills and the managing agents felicitating Mr. Balarama Iyer on the happy occasion and paying him glorious tributes for his qualities of head and heart, for the services rendered by him to the country in his various public activities and for the establishment of the Sitaram Mills in Trichur. Under the inspiring guidance of his uncle, the late Dewan Bahadur T. R. Ramachandra Iyer, the leader of the Madras Bar, Mr. Balarama Iyer started the mill with only five handlooms in a cadjan shed 35 years ago and gradually, by careful and economical management, it was developed through various vicissitudes to the present Sitaram Spinning and Weaving Mills Ltd., Trichur, with 416 looms and 15,372 spindles, fully equipped with a *pucca* workshop and foundry and dyeing, bleaching and finishing plants. About 2,000 families of the city are dependent upon the mills. On behalf of the operatives, staff and the constituents, the Dewan was requested to present him with a Diamond Jubilee Souvenir, which had been specially prepared for the occasion.

In commemoration of the "Shastyabda Poorthi" celebration, Mr. C. Sankara Menon, President of the Board of Directors of the mills, announced their decision to start a hospital for the benefit of the mill employees.

Mr. Balarama Iyer spoke a few words of thanks in his characteristic courteous manner, and his reply was read to the gathering by his chief lieutenant, Mr. T. K. Kodandarama Iyer. It contained a record of Mr. Balarama Iyer's selfless devotion to the cause of the development of the mills and the uplift of his employees. In his devotion to the interests of the mills he went to the extent of even suggesting to the Government to abolish the managing agency system. He then analysed the sound financial position of the mills and hoped that in post-war financial requirements the Cochin Government as usual would come to their rescue if needed.

"Women" observed Mr. Balarama Iyer, "make as good weavers as men. This is the only mill in India where women are employed as weavers, though in England and Japan there are women weavers. Out of about 850 single loom weavers about a third will be women weavers and the rest will be men. It will be interesting to note that in the matter of production the first five places are occupied by women and a male weaver comes only sixth. In spinning also the first two places are occupied by girl spinners and a boy spinner occupies only a third place."

Mr. Balarama Iyer concluded by enumerating some of the lessons which he had learnt from his practical experience during these years in the management of the mills.

Dr. R. M. Alagappa Chettiar, of Cochin Textiles, announced his endowment in commemoration of the occasion of a challenge cup for football to be competed for by the Cochin Textiles, the Alagappa Textiles and the Sitaram Mills every year.

Mr. C. P. Lonappen, Municipal Chairman of Trichur and a Director of the mills, then requested the Dewan President to unveil a full-size portrait of Mr. Balarama Iyer. Rising amidst cheers the Dewan President expressed pleasure at the happy coincidence of his own 60th birthday with the function, and paid tributes to the selfless work of Mr. Balarama Iyer, particularly in the industrial line. He then unveiled the portrait amidst great cheers.

Band and fire-works lent colour to the celebrations. The distinguished guests were garlanded and after thanksgiving the function came to a close with hearty cheers for His Majesty the King-Emperor, His Highness the Maharaja of Cochin, the Dewan and the honoured guest of the evening, Mr. Balarama Iyer.

Origin and Growth of the Sitaram Spinning and Weaving Mills

The Sitaram Spinning and Weaving Mills had, like all great institutions a very humble origin. The late Dewan Bahadur T. R. Ramachandra Iyer, B.A., B.L., Advocate of the Madras High Court, was the founder of the Mills.

In 1908, after celebrating the marriage of his eldest daughter, the thatched shed erected for the purpose was left intact and Mr. Ramachandra Iyer conceived the idea of putting up a few handlooms there. Five handlooms appeared in the pandal and this small business was named the Pushpagiri Weaving Factory and subsequently the shed was enlarged and the number of handlooms was raised to twenty. Mr. T. S. Balarama Iyer was put in charge of the factory. It was, however, soon realized that the handloom industry could not be made a commercial success and Mr. Balarama Iyer suggested the formation of a joint-stock company and the introduction of power-weaving.

Accordingly on the 24th of September 1909 the Pushpagiri Weaving Factory was converted into the Sitaram Weaving Mills, Ltd., and 50 power-looms and twenty-five handlooms started working with a capital of Rs. 1,20,000. The mill was named after Sree Ramaswamy, the presiding deity of the temple in Pushpagiri agraharam and thus invested with a religious background.

In 1912 the number of looms were increased to 150 consequent on the ever-increasing demand for the mill products and the capital was enhanced to Rs. 3 lakhs. The late Maharajah H.H. Sree Rama Varmah, G.C.I.E., honoured the mills with his royal visit and suggested that a spinning section also should be added to the mills. The royal suggestion was immediately taken up, the capital was further raised to Rs. 20 lakhs and up-to-date extensions to accommodate 2,000 spindles and 450 looms were made and in the year 1942 spinning was started with 10,138 spindles and 300 looms.

The formal opening of the Cotton Spinning section was done by Mr. C. W. E. Cotton, C.I.E., I.C.S., the then Agent to the Governor.

The mills continue to have additions in the spinning, weaving and engineering departments and has to-day 16,000 spindles and 425 looms run with a high super-heat bleeding turbine of 1,300 h.p. and it is now almost on a par with the best managed mills in India in the matter of machinery and equipment, management and staff, production and supply and the quality of goods produced. Its *dhotis* and grey longcloths, shirtings and other products, bleached or grey, can defy competition in any market in India.

The mills now work for 24 hours in three shifts and employ 3,000 hands of whom 1,200 are women.

It has arrangements for first-aid and medical service in cases of accidents.

In Jap-controlled Indies

Clothing from Ramie and from Banana and Pineapple Leaves

ON 24th August a Japanese-sponsored broadcast from Macassar, on the island of Celebes in the Netherlands Indies, announced the harvesting of the first crop of ramie, with which the Japanese authorities have been experimenting to replace the dwindling supplies of cotton. Ramie, which before the invasion of the Netherlands Indies, was imported from British India, was used exclusively as a substitute for jute in the making of sacks for storing sugar and rice. The Japanese, however, have found another purpose for the coarse plant; they will use it as clothing material. According to the broadcast, "the making of clothing (from ramie) for local inhabitants, by means of hand-weaving, has been successful, and a great deal is expected from this process in the future."

Not only ramie but also the leaves of banana and pineapple trees are being converted into material for clothing. The Japanese naval authorities in Banjermasin, in southern Borneo, have installed a spinning mill in that city, where Indonesian girls have been put to work making "endless streams of yarn." An enthusiastic radio commentator, broadcasting from Banjermasin on 29th August, said that the spinning mill is under the direction of a Tokyo raw-cotton company. "The machines installed in the mill are old-style ones," he said, "and they were imported from Java."—*Foreign Commerce Monthly*.

Tariffs and Industrialization

THE Oxford University Press, Bombay, brought out recently two pamphlets* of outstanding topical importance dealing with the subject of industrialization which has come to be universally acknowledged as indispensable for raising the standard of living in the country. The policy of "discriminating protection" so far followed has been of substantial assistance to consumption industries like textiles and sugar, but Dr. Matthai, one-time Professor of the University of Madras and Chairman of the Tariff Board and now a Director of the Tata Iron and Steel Co., Ltd., examines the limitations of the present policy and draws up tentative proposals for its revision in the light of the post-war needs of Indian industry. In the second pamphlet, Dr. Lokanathan, editor of the *Eastern Economist*, who had himself studied under Dr. Matthai at Madras, approaches the question from another angle and brings out lucidly the inescapable obligations of the Government towards formulating and carrying through an intensive policy of industrialization, which is examined under the different aspects of localisation, management, finance, etc.

Dr. John Matthai explains how, although the conditions laid down by the Fiscal Commission for the grant of protection are unexceptionable in theory, the way in which it has been administered in practice has been most unsatisfactory. While the policy has been a distinct success where it has been applied the author ventures the opinion that the additional burden of protection has been borne by the more well-to-do classes. As to the post-war period, Dr. Matthai believes that for about 5-10 years the demand for consumption as well as production goods will far exceed available supply, and during this period the problem will be "how to meet a reviving demand from countries which have been starved of goods with the limited supply available rather than to restrict supplies so as to avoid uneconomic competition and over-production." On this assumption, the assistance which Indian industries would require would be direct, e.g., finance, research, transport, etc., and not the indirect assistance which protective tariffs afford. When, however, normal peace economy returns, competition of the pre-war type may also return, but Dr. Matthai would not countenance "the perpetuation of national barriers to the free movement of trade" by the erection of high tariff walls. He quotes with approval the post-war plans† for international trade outlined recently by Sir Raymond Streat, President of the Cotton Board in England, and distinguishes as possible the three following stages in the development of India's trade policy after the war.

(1) During the years immediately following the termination of hostilities, it will not be necessary to adopt a policy involving other than a moderate restriction of imports as regards consumable as well as capital goods.

(2) While a large-scale industrial plan is under way, its successful prosecution will call for a policy of high tariff or similar restrictive measures for consumable goods and generally of free trade in capital goods.

(3) When the more essential industries envisaged in the plan have been established, the weight of restrictive measures will be shifted from consumable to capital goods. Since restriction in the case of capital goods, if enforced by means of high import duties, will lay a heavy burden on all industries, other measures of protection will have to be devised for the assistance of Indian industries producing goods.

In the second pamphlet under notice Dr. Lokanathan takes stock of India's industrial resources. It is the biggest producer of raw cotton next to U.S.A., it enjoys a monopoly of jute and has abundant supplies of wool. And yet industrial progress has been slow and irregular, so that India has continued for long to be an importer of manufactured articles. Dr. Lokanathan lists the various causes of such meagre and ill-balanced industrial development as has so far been registered. The initiation of the policy of discriminating protection led, however, to marked progress particularly in several consumption industries like textiles and sugar. The partial industrialization that has already taken place is reflected in the changing content of India's external trade. Between 1914 and 1939 consumption goods imports have diminished in relative importance while the imports of machinery and other production goods registered a significant increase, pointing to a gradual process of industrialization. Dr. Lokanathan agrees with Dr. Matthai that the too rigorous application of the principles laid down by the Fiscal Commission has thwarted the establishment of several vital production goods industries. Above all, the whole system of protection, he continues, "by which the prices of protected articles necessarily increased, was unsound so far as the protection of the key industries and the basic industries was concerned. These industries should have been helped not by protection but by so adjusting the system of public finance as to provide them with direct bounties and subsidies."

---

*__Tariffs and Industry.__ By John Matthai, Oxford Pamphlets on Indian Affairs, No. 20, Oxford University Press, Nicol Road, Bombay. Price: 6 annas.

Industrialization. By P. S. Lokanathan, Oxford Pamphlets on Indian Affairs, No. 10, Oxford University Press, Nicol Road, Bombay. Price: 6 annas.

† See the *Indian Textile Journal*, June 1943, page 291.

At the outbreak of the present war Indian industries, for all the progress achieved, were still unorganized and comparatively inefficient and ill-balanced. Even the growth of consumption industries like textiles had not led to the creation of auxiliary industries like the manufacture of shuttles, bobbins, pickers, etc., on any considerable scale. But the war brought with it shipping restrictions, import restrictions, and failure of customary supplies from abroad, and these factors have, of course, quickened industrial production. For the first time several textile accessories are being manufactured in India and the textile industry itself has developed several new lines of manufacture. But compared with the progress made in Canada and Australia, India's record pales into insignificance, and Dr. Lokanathan's facts and figures speak for themselves. Starting from an initially worse position than India, Australia and Canada have already stolen a march over India. In the conditions obtaining in India to-day, therefore, Dr. Lokanathan pleads for a more direct and active association of Government with industrial activity. But it is realized that any plan of industrial development in India is bound to be a flop if it is not adequately backed by a national Government embodying the hopes and aspirations of the people. While Dr. Matthai emphasizes the need, therefore, for the early establishment of a national Government at the Centre, Dr. Lokanathan goes one better and shrewdly sounds a note of warning against the dangers of authoritarian control in any scheme of industrialization, whether the Government of the country is alien or national.

Silk-worms in Brazil Kept Cool to Produce More Silk for War

SILK-WORMS are doing their bit for the Allied war efforts from refrigerators in Brazil, producing large quantities of the essential material which formerly came from Japan, says a statement by the Office of the Co-ordinator of Inter-American Affairs.

Like many other inhabitants of temperate zones, the silk-worm functions most efficiently in cool surroundings. Brazil, which has every facility for silk-worm culture except cool weather, is now employing refrigerators to speed up the life cycle of the silk-worm from cocoon to butterfly, thereby producing more eggs and young worms, and increasing silk production.

Tests conducted with refrigerators in experiment stations have shown that 10 crops of cocoons may be produced in one year by the proper application of cool air, and extensive refrigerating units have been installed in at least one experiment station to accelerate silk-worm production. The normal climate of Brazil is ideally suited to the production of the mulberry trees which are essential to silk-worm growth.

To make Brazilian silk production as efficient as possible in every respect, wide experimentation is being carried on with 300,000 mulberry trees to develop the most satisfactory strains. The product of this combined experimentation in mulberry-tree culture and silk-worm refrigeration will eventually find its way to parachutes, powder bags, and a host of other war materials, essential to Allied victory.—*Foreign Commerce Monthly.*

OUR PERSONAL COLUMN

Sir M. Visvesvaraya has been re-elected President of the All-India Manufacturers' Organization, Bombay, for the year 1945.

Raj Ratna Mr. Ramji Hansraj Kamani, Chairman of Kamani Group of Industries, has been re-elected President of the Jaipur Chamber of Commerce for 1945.

Mr. H. K. Kirpalani, I.C.S. (Retd.), formerly Adviser to the Governor of Bombay and ex-Prime Minister of Bikaner, has been appointed Industrial Adviser to the Government of India in the Department of Planning and Development.

Mr. Kirpalani has had wide administrative experience as Municipal Commissioner of the Bombay Corporation, Chairman of the Bombay Port Trust and Chief Secretary both of Sind and Bombay.

Mr. C. W. Tosh has been elected Vice-President of the Upper India Chamber of Commerce, Cawnpore, for the year 1945, while the following members have been co-opted as members of the Committee for the same year: Mr. W. J Packwood (the Cawnpore Chemical Works Ltd., Cawnpore), Mr. D. H. Peel Yates (Messrs. Bird & Co., Cawnpore), and Lala Ram Narain Garg.

Two labour experts—**Messrs. Raghavendra Rao** and **Staig**—have been invited by the Government of India to assist them on their proposals relating to Health Insurance. These officers belong to the International Labour Organization. They are being taken round India by the Government of India's own expert, Professor B. N. Adarkar.

The following members will constitute the Committee of the Bengal Chamber of Commerce for 1945-46:—President: Sir Renwick Haddow; Vice-President: Mr. H. D. Townhend; Members: Sir Harry Burn, Mr. H. D. Cumberbatch, Mr. A. J. Elkins, Mr. F. C. Guthrie, Sir George Morton, Mr. L. O. Tasker and Mr. P. F. S. Warren.

Mr. C. V. Nagaraja Sastri, Barrister-at-law, has been appointed Assistant Registrar, Trade Marks, Bombay.

Mr. Charles Lister was elected President for the current year, at the third annual meeting of the Bombay Wool Merchants' Association held in Bombay, Mr. J. Doongursee was elected Vice-President, and Mr. Haji E. Dossa, Honorary Secretary.

The Bombay Chamber of Commerce has elected Mr. W. A. Bell, Mr. R. W. Bullock, Mr. C. J. Damala, Mr. A. D. Finney, and Mr. D. R. C. Hartley to serve as representatives of the Chamber on the Board of Trustees of the Port of Bombay for a period of two years.

The following members have been elected to the Committee of the Cotton Buyers' Association for the year 1945:—Sir Joseph Kay (*President*); Mr. M. R. Ruia (*Vice-President*), Messrs. P. N. Philon, J. L. Hurschler, C. Shuttleworth, L. M. Khatau, R. C. Suntook, John R. Kay, Arthur Pether and J. P. Patel (*Hon. Secretary*).

Mr. P. H. Krishnarao, M.A. Commissioner for Development and Planning in Mysore, Secretary, Economic Conference, Superintendent of the Sri Jayachamaraja Occupational Institute and senior member of the Mysore Civil Service, has been appointed by the Government of India as Deputy Controller-General of Civil Supplies, with his headquarters at Bombay.

Mr. K. C. Mahindra, a business man who was till recently head of the Indian Supply Mission in the United States of America, has relinquished his charge, and the Government of India have decided to appoint **Mr. J. Vesugar** of the Indian Service of Engineers as head of the India Supply Mission in U.S.A. in succession to Mr. Mahindra. Mr. Vesugar was till recently Chief Engineer in the Punjab and subsequently Industrial Adviser to the Planning and Development Department of the Government of India.

Mr. B. B. Joshi, L.T.M. (Hons.), Additional Controller, Raw Materials and Stores, Department of Industries and Civil Supplies, Government of India, Bombay, has been awarded the associateship of the Textile Institute, Manchester, (A.T.I.) in recognition of his services to the textile industry of India.

Messrs. Tansukhrai M. Karundia, Kantilal Nahalchand, Raghunath B. Apte and Sir Joseph Kay, Kt., have resigned from the directorate of the Morarjee

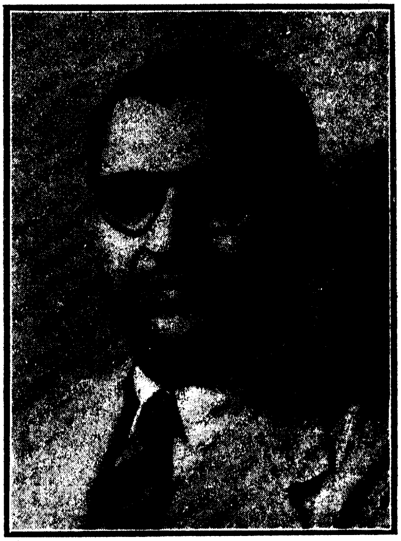
Goculdas Spinning and Weaving Co., Ltd., Bombay.

Rao Bahadur R. Guruswamy Naidu, landlord and Managing Agent, Palani Andavar Mills, Limited, Udamalpet, who was the recipient of the title of Rao Bahadur in the New Year Honours, was born in 1885 in a rich Kammavar family in the village of Pedappampatti. He commenced his business and public career early in life and has served for several years as District and Taluk Board Member and on the District Temple Committee. During the period of his membership of the District and Taluk Board, he was very keen on the formation and improvement of rural roads and linked many of the out-of-the-way villages with roads. He is a member of the Coimbatore District War Committee, member of the Local Government Hospital Advisory Committee and Director of the Land Mortgage Bank, Udamalpet, besides being connected with many charitable and public institutions.

Of a generous and charitable disposition Mr. Naidu built and donated a hospital and a school in his village in 1922 and last year he constructed a maternity ward in the Government Hospital, Udamalpet, in memory of his late wife Srimathi Rathnammal, at a cost of Rs. 60,000 with up-to-date sanitary and other equipments.

We understand that Mr. Naidu proposes to start a new cotton mill in South India just on the termination of the war and with this idea has already placed substantial orders for machinery and equipment with some leading English machinists.

Mr. B. M. Bagri has been elected President of the Bengal Millowners' Association, Calcutta, for the current year. He has been on the Committee of the Association for some years and was also its Vice-President. He is the Secretary of the Kesoram Cotton Mills Ltd., which is one of the biggest and well-equipped mills in Bengal. He is the representative of the Bengal Millowners' Association on the Advisory Panel of the Textile Control Board and on the Federation of Indian Chambers of Commerce food supply organization.



Mr. Bagri is a Commissioner of the Garden Reach Municipality and the Chairman of the Hindu Sramjivi Library and School, Matiabruz.

Mill Staff News

Mr. S. G. Chowdhury, B.Sc., has joined the Moon Mills Ltd., Bombay, as Assistant Manager and not as Factory Manager as mentioned in the January issue of this Journal.

Mr. M. G. Dhanuka, M.Sc., Betterment Secretary, has been promoted to the post of General Secretary of the Savatram Ramprasad Mills Co., Ltd., Akola. He is also the General Manager of all other Savatram concerns. He comes from a respectable Marwari Agrawal family.

Mr. D. Fernandes (late of the Century Spinning and Manufacturing Co., Ltd., Bombay), Carding and Spinning Master of the Shri Laxminarayan Mills Co., Ltd., Chalisgaon, East Khandesh, has been promoted to the post of manager since 18th January 1945.

Mr. Chandubhai J. Patel, B.Sc. (Bom.), M.Sc.Tech. (Manchester), A.M.C.T., F.C.S., has joined the Shree Ambica Mills Ltd., Ahmedabad, in the capacity of Chief Chemist and head of the Bleaching, Dyeing and Finishing Departments.

Until recently he was working with the Monogram Mills Co., Ltd., Ahmedabad, as their Chief Chemist and Head of Bleach and Dye Works. He was also consultant as a Textile Chemist to the Ahmedabad Commercial Mills Co., Ltd., and also Messrs. India Textile Agencies specially regarding execution of Government war orders. After taking the degree of B.Sc. of Bombay University in 1934, Mr. Patel joined the Indian Bleaching, Dyeing and Printing Works Ltd., Bombay. In 1935 he went to England and joined the College of Technology, Manchester, where he passed the B.Sc. Tech. with first class first. In view of his satisfactory work as an undergraduate and his aptitude for research work he was awarded the Manchester Corporation Research Scholarship in Technology, which enabled him to obtain the degree of M.Sc.Tech. in 1938. During the college vacations he had practical training in several dye works in England and Germany. He, also, worked in the laboratories of Imperial Chemical Industries Ltd., England, and of I.G. in Germany.

Mr. Bhupesh Lobhan Sen, Laboratory Officer, Volkart Brothers, Dyes Department, Bombay, has been elected an ordinary member of the Textile Institute, Manchester, England, at a recent meeting of the Institute.

Mr. Sen belongs to a respectable family of Sonargaon, Dacca, Bengal, and while studying in the B.Sc. course at the Calcutta University he showed a partiality for colour chemistry. With that view he left studies and joined Messrs. Havero Trading Co., Bombay (afterwards Chemdyes Limited) and worked as laboratory technician under the direct supervision of Dr. Winterhalder, dealing with the dyestuffs of I.G. Farbenindustrie A. G., St. Denis and Etablissements Kuhlmann of Paris, Rohner and Durand and Hueguenin of Switzerland. During that period he was also visiting the Bombay Union Dyeing Mills.

He has joined Messrs. Volkart Bros., Bombay, who had then taken over the agency of C.M.C. French Dyes. At present he conducts laboratory technical work relating to textile dyeing, printing and allied work for them.

He has contributed articles occasionally on textile dyeing and industry to Bengali and other vernacular papers.

Mr. Bhishmasen Ishwarlal Matchhar, A.R.T.C. (Eng.), son of Mr. Ishvarbhai Patel, Consulting Enginer to textile mills, has recently returned from England after a stay of five and a half years. After spending 1½ years in the bleaching, dyeing, finishing and printing departments of the Standard Mills, Bombay, as an apprentice under the guidance of Dr. A. M. Patel, Mr. Matchhar sailed for England for further studies in 1939 at the age of 18 years, and joined the Royal Technical College, Salford, and underwent an exhaustive three-year course in pure and textile chemistry and obtained diploma in 1942. In the same year, he passed in the first class the final examination of City and Guilds of London Institute in dyeing and textile from time to time in the administration of the Control Orders, and with the activities of the Federation and its various member bodies. One of the primary objects of the Federation is to organize the cloth and yarn trade on a nation-wide scale and disseminate enlightened and progressive views wherever necessary. The News Bulletin can be of great help in fulfilling this purpose, provided necessary co-operation is forthcoming from all those concerned in making it a live and influential mouthpiece of the trade.

Journal of Scientific and Industrial Research, III, 8, New Delhi.

The scope for developing the manufacture on a cottage industry basis of silk-worm ligature gut, used as sutures in surgical operations, was described succinctly in an article which appeared in the *Indian Textile Journal* in January 1943 (page 111). The article dealt with the raw material, the treatment of worms, the process of extraction, the treatment of guts, cutting, sorting and grading, and the preparation of guts in long lengths.

In an article in the issue of the *Journal of Scientific and Industrial Research* under notice, details of a war-time industry started to meet the pressing needs of the surgical profession, namely, the silk-worm ligature industry at Kollegal, are given. The initiative for the production of surgical guts was taken by the Department of Industries and Commerce, Madras. The entire process for extracting the silk glands from mature, robust, mulberry silk-worms and drawing them out into strong suture guts suitable for the use of the surgeon has been systematically worked out.

Pessimism in Planning. By A. N. Agarwala, M.A. Published by Kitab-Mahal, Zero Road, Allahabad. Price: Rs. 5-12-0.

The book under review should be highly welcome at this stage of India's industrial development. Planning is very much in the air, and its objects and methods have been the subject of discussion in the Press and on the platform. While this is all to the good, it would appear that not enough importance has anywhere been attached to the hurdles to be overcome and the difficulties to be surmounted in putting the plans into effect. Mr. Agarwala's essay tries to meet this deficiency. While it does not attack the advisability and necessity of planning for the effective regeneration of Indian economy, it does what few other publications set out to do; it draws the reader's particular attention to the difficulties in the way of implementing the plans and to the necessity of solving or overcoming these difficulties before any really effective plans could be initiated. In this view it is hard to exaggerate the value of Mr. Agarwala's work.

Planning India's Electrification. By K. V. Karantha, M.A., P.O. Box 156, Madras. Price: Re. 0-6-0.

Mr. Karantha, who was until recently connected with several electricity undertakings in the province of Madras and has since been appointed Chief Electrical Inspector to the Government of that province, writes in this booklet on the 7,00,000 K.w. power-plant expansion scheme of the Government of India, and points out the urgent need of developing and multiplying electricity-using industries in India. He makes several useful suggestions for overcoming the obstacles to cheap electricity in a country like India and will be read with profit by all interested in the subject.

Maintenance Instructions for Air Break Circuit Breakers is the title of an excellently got-up booklet issued gratis to all existing users of air break circuit breakers by **J. G. Statter & Co., Ltd., 82, Victoria Street, London, S.W., England.** The book gives useful guidance in the installation and maintenance of "Statter" air break circuit breakers.

Morris Worm-gear Pulley Blocks. Published by Herbert Morris Ltd., Lougborough, England. (Book 199). (Indian Agents: W. H. Brady & Co., Ltd., Royal Insurance Buildings, Churchgate Street, Bombay).

The purpose of a good pulley-block is to yield a maximum of lift in return for human effort. In Morris pulley-blocks, this objective is achieved remarkably well, through the use of a machine-cut worm and worm-wheel of just the right pitch angle and tooth profile to give the highest mechanical efficiency.

The gears are housed in a rigid steel frame to ensure continuous alignment. Their motion is so easy that a load on the bottom-block would set them rotating. So a one-way automatic brake is fitted. This allows free rotation in lifting but creates just enough resistance in lowering to keep the load in balance. The brake resistance is at all times proportional to the load on the hook.

If a pulley-block is to operate smoothly there must be perfect meshing of the load-chain with the loadwheel. The pockets of a Morris loadwheel are believed to be actually moulded to receive a chain whose links are very precisely formed. The combination of chain and wheel is, therefore, a mechanism which should lift loads without jerk or slip.

G.E.C. Osram Bulletin, Vol. 22, No. 2. Published by the General Electric Co., Ltd., Magnet House, Kingsway, London, W.C. 2. The issue under notice includes highly interesting articles on infra-red lamp heating in industry and on some special uses of fluorescent tubes.

Delhi Cloth Mills Technical Journal: June and September 1944. Recently the Delhi Cloth Mills have started a course of training for preparing jobbers and *maistries* for the various departments of a spinning mill. Educated young men are taken up and given thorough theoretical and practical training in a room specially set apart for the purpose and equipped with all the necessary machines and tools. The issue of the *Technical Journal* under notice contains, besides other interesting articles, schedules for dismantling and erecting a fly-frame, which form part of the instruction given in the spinning staff technical school referred to above, as well as the curriculum of studies in the school.

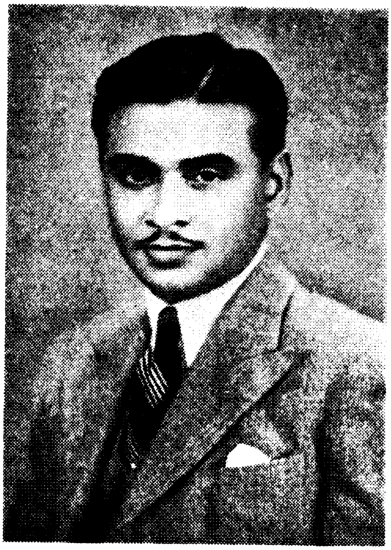
* * *

In the course of an interesting article on the role assigned to the State in the Adarkar scheme of sickness insurance, in the February 1945 issue of the **J. K. Review**, Mr. A. N. Agarwala, of the Allahabad University, demonstrates how Mr. Adarkar has skilfully solved several difficulties regarding State contribution to the sickness insurance scheme and State control of its administration, and draws the reader's attention to important suggestions contained in it.

Leather Belting for Power Transmission

How to Use it Economically

MOST users of leather belting, even some of the largest in the country, pay very little attention to the care of leather belting once it has been purchased. This carelessness, born of ignorance, is bound to cause unnecessary loss, for constant care should be given to the belting during its storage as well as in operation. Here are a few suggestions that will enable the user not only to get the maximum efficiency but longer life out of a belt.



MR. N. J. NAIR, Managing Director, Textile Supplies Syndicate (India), Ltd., Bombay, who has written this article, has had practical training in leather belt making at the factory of Graton and Knight Co., U.S.A., one of the largest of its kind in the world.

During Storage

Store the belting in a cool dry part of the godown. Exposure to the sun is liable to harden the leather and hence reduce its natural flexibility, which is most essential during operation. If there is dampness near and around the belting while being stored it will cause fungus or mildew to be formed on the surface and between the coils. This condition must not be allowed to arise as the belting will deteriorate in its vitality just as human beings do during an attack of pneumonia.

Once every three months open out the rolls of belting on the floor and apply a suitable belt dressing lightly on both sides of the belting. Then re-roll them and put them back into the racks.

It is recommended that the rolls of belting are stacked in a standing position to facilitate convenient handling while taking out for dressing, and for cutting out required lengths. Keeping the roll flat on the floor or one over the other is liable to damage the edge of the belting while handling.

Before Operation

The exact length required for a given drive may be determined by running a steel tape around the pulleys tightly and then allowing six inches more in the case of single-ply belting upto five inches width. For widths of 6″ to 10″ single-ply belting, nine inches more are recommended. This extra length is intended for lap when joining the two ends of the belting to make it an endless belt ready for power transmission.

It is not advisable to put one end of the belting over the other while lacing, as such overlapping will impede the smooth and efficient running of of the belt on the pulleys. The most satisfactory way is to taper both ends of the belting and then make a lace joint. This method will give an evenness throughout the belt and would, therefore, ensure smooth operation.

Another satisfactory method of joining the two ends of belting before putting on the pulleys is to use a steel belt lacer of the clipper type. In this instance tapering of the ends is not necessary and the square ends, after lacing, can be brought to meet edge to edge and hooked together with a raw hide or bakelite pin. When joining the ends of double belting the most satisfactory procedure is to adopt the steel belt lacing as described above as long as the width of the belting is not over six inches. For belts above this width it is advisable to use a waterproof belt cement and make the belt endless before putting on the pulleys or to do the cement jointing on the pulleys with the assistance of clamps and rods.

Note.—Most workmen in charge of leather belting generally punch extra holes near the lap in order to speed up the work when a belt has become loose and it has to be tightened. This is a most unsatisfactory practice, as the open holes will weaken the belt very considerably in that particular part and will even cause the belt to snap during operation. Workmen must therefore be warned against punching any extra holes after a joint has been made.

During Operation

It is recommended that the leather belt is run on the grain or polish side to the pulleys. Experiments have proved that there is more coefficient of friction on the polish side of a leather belt, and that there will be less slippage, if at all, by running the belt with the polish side close to the pulleys. A microscopic observation of the polish side will show that the grain of the leather on the polish side is much more uniform. These grains which form into air sockets will enable the belt to cling to the pulleys more tenaciously than it would be possible with the flesh side of the belt to the pulleys.

Operate all leather belts just as slack as possible without slipping. When it becomes necessary to operate a belt tightly in order to make it pull the load there is sure to be something wrong with that drive and, therefore, it should be speedily remedied. Either the belt does not have a good pulling surface or it is too small for the job.

Inspect periodically the machines and the shafting to ascertain that the alignment is proper.

Pulleys improperly aligned will ruin belting. Just because that shafting was once in line it does not necessarily follow that it will always remain so. Therefore, frequent inspection in this regard will be most beneficial.

When a belt is being installed it should be given a good treatment with a suitable belt dressing. After working for some time, if a belt appears harsh and dry, it indicates that wear has removed some of the natural oils and these oils should be replaced. To do this, remove the belt from the pulleys and clear the surface of all dirt carefully with a blunt-edged scraper, or if necessary, with petrol. When the belt has been cleaned, apply belt dressing lightly on both sides, and put the belt back into service.

Surplus grease and oil are injurious to belting and give it a poor frictional surface, which causes slippage. De-greasing or de-oiling can be accomplished by removing the belt and packing it in dry saw-dust for some time before being put back into the job. The saw-dust will absorb all the excess oil and/or grease in the belt.

As belting plays a very important part in the profitable working of any factory it needs no emphasis that the utmost care must be exercised in the purchase of a good quality and in its maintenance. In the factories of most European countries, generally, a belt engineer is maintained whose only job is to purchase suitable belting for his drives and attend to its economical use. I would strongly recommend such a course being adopted by Indian mill and factory owners, most of whom, whether they know it or not, are at present wasting considerable amount of money due to want of care in this most important matter.

New Cotton Mill for Bengal

Bengal Cotton Mills, Ltd.

A COMPANY has been formed, called the "Bengal Cotton Mills Ltd." (Registered Office: 15, Clive Street, Calcutta) for the purpose of carrying on the business of spinning, weaving, dyeing, bleaching, mercerizing and printing of cloth and yarn and it intends to specialize in finer varieties of yarn and cloths. The site proposed to be acquired for the mills of the company is situated at Sodepur only about 10 miles from Calcutta and easily accessible to Calcutta by motor, rail and river. Trained and efficient labour will be assured; coal will be available in any quantity from the neighbouring Bengal and Bihar coal-fields; raw cotton will also be easily available as Calcutta already imports a large quantity of various kinds of cotton. Bengal, and especially Calcutta, is a big centre for consumption of cloth and yarn of the various counts and varieties and the local mills are quite insufficient to meet the demand. The war has proved conclusively that the present cotton mills in India, even if they work up to capacity are unable to meet the internal demand of cloth and yarn and specially of the finer varieties. Bengal is particularly lacking in this respect. The few mills situated in Bengal are wholly insufficient to meet the demands of Bengal. If there had been more mills in Bengal it would not have had to pass through the cloth famine through which it is passing now. For a requirement of about 1,000 million yards of cloth Bengal produced only 220 million yards during April 1943 to March, 1944. There has always been a good demand for the products of Indian mills from the neighbouring countries and, due to the devastation caused by the war and the big reconstruction programmes of the various countries, such demand is likely to increase to a great extent after the war. The cotton mills, especially those in Bengal, have a very bright future before them. Calcutta has all along been one of the important centres for supply of yarn and cloth both for internal consumption and for export, and its importance is likely to increase after the war. The existing mills are not equipped with the latest machineries. The company proposes to equip its mill with about 40,000 spindles and 800 looms and with the latest types of machineries incorporating the improvements which the accelerated research during the war has made possible. Provisional orders for part of the machinery have already been placed and every effort is being made to import the machineries as early as possible. With the prospect of an early termination of the European war in favour of the Allies, it is expected the machineries will arrive shortly, and the company therefore proposes to purchase land and to construct the buildings at an early date so that no time may be lost in erecting the machineries after they arrive in India. It is expected that the erection of the mills will be completed and the mills will start working within about a year after the termination of the war.

The Directors of the company are: Lala Guru Sharan Lal, Mr. Chandi Prosad More, Mr. Rameswar Lal Nopany, Rai Bahadur Kedarnath Khetan, M.B.E., M.L.C., Raja Narayan Lall Bansilal, Merchant, Mr. Lakshmi Narain Bhadani and Mr. Radhakishan More.

Messrs. More Bhadani & Co., Ltd., 15, Clive Street, Calcutta, are the Managing Agents of the mill.

The company has been formed with an authorized capital of Rs. 50 lakhs, divided into 3½ lakh ordinary shares of Rs. 10 each and 15,000 preference shares of Rs. 100 each. The issued capital amounts to Rs. 30 lakhs, divided into 2 lakh ordinary shares and 10,000 preference shares.

Commercial and Technical Organizations

Federation of Indian Chambers of Commerce and Industry, New Delhi

18th Annual Session

THE following are extracts from the presidential address of Mr. J. C. Setalvad at the 18th annual session of the Federation held in New Delhi on the 3rd March 1945:—

"It is a matter of painful surprise that the authorities, with all the sources of information at their disposal, should have permitted the coal situation to deteriorate to the extent which was experienced last year. In my opinion this is very largely attributable to the deficiencies in our general statistical organization which does not provide at any given time up-to-date data to make possible the formulation of right policies both as regards immediate conditions and future development. The failure on the part of Government to tackle this situation in advance must also be attributed to the fact that several departments of the Central Government are partly responsible for handling the coal situation. I fail to understand that when countries like the United Kingdom and the U.S.A. with their enormous manufacturing capacity, can produce thousands of planes, tanks, trucks, etc., it should be found impossible for the Government of India to obtain from these countries coal-cutting and other machinery as well as essential stores to enable Indian collieries to produce larger output. It is also not easy to understand that with the enormous man-power in the country, shortage of labour should handicap maintenance of even pre-war output. Two directions in which Government ought to concentrate are the conservation of our superior qualities of coal for our metallurgical industries and, secondly, intensive geological surveys throughout the country to find additional sources of coal supply.

Mr. Setalvad said that the Hydari Mission had something to do with the coal situation. He feared that it was the intention still further to curtail the operating capacity of some of India's big industries, such as steel and chemicals, which required large supplies of coal and to replace the reduced output by imports from abroad, particularly from the United Kingdom. Mr. Setalvad, on behalf of the Federation, registered an emphatic protest against any such action on the part of the Government of India and demanded that the Indian public should be taken into confidence regarding the Hydari Mission.

Reconstruction and Planning

"The Planning Member in one of his public statements said that Government were considering the question of instituting a permanent Tariff Board. I cannot understand why there should be so much delay in Government taking immediate action in this direction. The institution of a permanent Tariff Board would make possible detailed and scientific examination of new industrial projects which could in the near future be brought into existence with, if necessary, the assistance of Government on the recommendation of such Tariff Board. Government also must clarify their existing nebulous attitude towards the number of new industries started during the war by referring their cases to this Tariff Board and on their recommendation give a categorical assurance that Government would stand by such industries after the war. There are a number of small and medium scale industries which to-day are rendering a very important and useful service in the supply of materials to our large industries and which before the war were practically entirely imported from abroad. It appears that in recent months under the guise of making available larger quantities of consumer goods to the country, competing imports of such products have already started, prejudicially affecting these new industries. Here is a case where immediate action is called for on the part of Government and imports of such competitive goods should be so regulated that the new industries are allowed to work at their maximum capacity to supply the needs of the Indian market and that foreign imports be restricted only to make good the balance required."

"I am glad to say that during the past year we have got going our Research Department. Its activities at present are extremely limited but it is capable of rendering very useful and valuable services, provided in course of time it is gradually expanded to cope with the necessities of the situation. I, therefore, make a most fervent appeal to all interested in promoting India's commercial and industrial activities to contribute substantially to the resources of the Federation."

The session was attended by representatives of the various Chambers of Commerce and Sir Jeremy Raisman, Sir Ardeshir Dalal, Sir Azizul Haque, Sir A. Ramaswamy Mudaliar, Mr. Bhulabhai J. Desai and members of the Central Legislature.

After Mr. J. C. Setalvad's presidential address, the meeting passed a number of resolutions.

The Federation passed a resolution urging the necessity of an early declaration of industrial policy by the Government of India on three points, namely, the role of the State in future; the measure and extent of protection to be extended against internal and external competition to Indian industries both in existence and those that may be started hereafter; and India's participation in any international arrangements which may impede the fullest utilisation of India's resources.

Working of Controls

It also adopted a resolution moved by Sir Badridas Goenka on the effect of various controls on trade and industrial development. The Federation expressed its concern at the working of the numerous controls imposed by the Central and the Provincial Governments from time to time relating to the import and export of commodities, procurement, purchase, distribution, transport and movement of commodities from place to place, as those controls had resulted in bribery and corruption and had not only dislocated smooth and efficient working of the normal channels of trade but had also failed to produce the desired results. The Federation was further of the opinion that the system of the controls which should have been designed and worked so as to accelerate production rapidly had, in the main, been restrictive and injurious and had created artificial difficulties in the conduct of trade and industry by imposing undue restrictions on the floating of new concerns and on the grant of import licences for importing raw materials, plant and machinery for increasing industrial production. The Federation believed that in any scheme of Government control, the association of non-official commercial and industrial interests should have been a *sine quo non* of its imposition and working, if inefficiency, delay and failure were to be avoided. It urged the Government to review the administration of all controls, revise and rationalize them so as to encourage industrial and agricultural expansion and facilitate smooth and quick distribution through normal trade channels.

Sir Sri Ram asked how Indian industries could flourish if they were not given adequate transport facilities and coal. He said that a deputation on behalf of the Federation had waited on the Commerce Department and represented that certain industries in India were capable of fully meeting the country's demands, and yet orders for the articles had been placed abroad at higher rates than those that prevailed in India. The deputation was told that there had been a mistake, but Sir Sri Ram said, some Indian industries would have to suffer for that mistake.

India's Export Trade

Sir Chunilal B. Mehta (Bombay) moved a resolution on the development of India's export trade. The resolution asked the Government of India to take energetic steps to enable Indian industries not only to maintain their present position in the foreign markets but also to secure an increasing share of those markets in the post-war period. "The Federation is of the opinion," the resolution stated, "that with a view to securing a proper place for India's exportable surplus of raw materials, the Government of India in consultation with the interests concerned, should devise measures to counteract the effects arising out of the subsidized exports of raw materials by other countries in foreign markets and to secure a more advantageous position for such of India's monopoly raw materials as raw jute, raw cotton, mica, etc."

Sir Chunilal explained how during the war a situation had arisen by which the old connections of Indian exporters were slowly disappearing. The main reason for that was the activity of the U. K. C. C. and some of the countries of the world centralizing their purchases in India through their own agencies.

Lala Karamchand Thapar moved a resolution expressing concern over the future prospects of further industrialization of India unless an increasing production of coal was assured by Government taking all possible steps at an early date to explore new sources of supply by undertaking an extensive geological survey of India: by rationalizing the existing resources and by the railways offering such prices for coal as would ensure the continued operation of the collieries and provide for their proper development. The resolution also urged that low volatile coal should be conserved for the metallurgical industries and should not be frittered away by supplying bunkering coal at Indian ports for the requirements of Allied Nations.

Taxation Policy

Mr. D. P. Khaitan moved a resolution declaring that the war-time taxation policy of the Government of India in respect of industries tended to hamper the post-war industrial development in the country. It left inadequate reserves to meet the post-war requirements of industries for necessary renewals, replacements and expansion of their capital assets and thereby undermined their stability and competitive strength *vis-a-vis* industries in other countries. The Federation urged upon Government the necessity of so formulating the tax structure as would positively encourage and accelerate the industrial progress of India.

The Federation decided by a majority to increase the subscription of member bodies from Rs. 200 per year to Rs. 500.

New President

Sir Badridas Goenka was unanimously elected President, Lala Gurusaran Lall, Vice-President, and Mr. N. R. Sarker, Treasurer of the Federation for the coming year.

The Millowners' Association, Bombay

Rehabilitation of the Cotton Textile Industry after the War.—A representation was made by the Association to the Central Board of Revenue in connection with certain matters relating to income-tax and excess profits tax administration recently.

The following is a brief resume of the points made by the Association and the Government's reply in the matter:—

The first point raised by the Association was in regard to the expenditure which would have to be incurred by employers in reconverting the industry to the post-war footing, especially if that expenditure had to be incurred after the E.P.T. had been removed. The Association had suggested that Government should make it a rule that, if such conversion took place within a specified reasonable period after the termination of the war or the removal of the E.P.T. whichever was later, it should be allowed as expenditure and adjusted in the last E.P.T. assessment. Government's reply was that, if during the excess profits tax chargeable accounting periods a mill were to be reconverted to its former state, the cost of reconversion would be allowed as a revenue expense, but that the question of expenses similarly incurred after the termination of E.P.T.

was a matter to be considered with many others when providing for the termination of the tax.

The Association had suggested that, where an industry had set aside a special sum for repairs and renewals, it should be allowed as a deduction for the purpose of E.P.T. even though it had not been utilized on the understanding that, if the amount was not utilized within a reasonable period after the termination of the war, then, whatever had not been utilized would be regarded as income in the last year of the E.P.T. and assessed as such. To this suggestion, the Central Board of Revenue had pointed out that deferred repairs were already provided for under section 26 (3) of the Excess Profits Tax Act, and that there was, therefore, no reason for action as proposed by the Association. The Association did not consider this reply to be quite satisfactory, and an assurance was asked for from Government to the effect that a claim for deferred repairs could be permitted which would allow the industry the cost of putting in the genuine spare parts which would have been used under normal conditions so that machinery could be put into the condition in which it would have been kept in normal circumstances, subject, of course, to normal wear and tear.

The third point raised by the Association was that the return of the industry from war-time production to peace-time production might involve the scrapping of buildings, plant and machinery which had been provided as a part of the war effort. The law already provided relief in respect of any losses so incurred, but it was thought that relief should not be confined to cases where equipment was actually scrapped, but should cover also any loss of value in cases where the equipment might continue in use. Government stated that this point had been noted for further consideration.

The fourth point related to trading stocks with mills, and the suggestion was that, if valuation taken for purposes of assessment in the last year of E.P.T. was not realized within a reasonable period thereafter, the assessee should be given an opportunity for reopening the last E.P.T. assessment with a view to set off the loss which had arisen from the drop in valuation.

Control of Electricity Supply Industry.—The views of the Association on the subject of State or quasi-State control of electricity enterprise were recently invited by the Government of Bombay. The Association were of opinion that there was no justification for the recommendation embodied in the draft resolution that further development of electricity supply in India should be actively pursued as a State or quasi-State enterprise. The experience of the member mills of the Association was that the service rendered by privately managed supply companies in Bombay had been entirely satisfactory. The Association, therefore, felt that it was unlikely that State or quasi-State managed enterprises would be as efficient as the privately managed concerns, and they apprehended that an attempt might be made to subsidize the losses from the proposed extensions into rural areas out of the charges made to industrial consumers in urban areas. So the Association considers that the development of electricity should be left to private enterprise under the control and supervision of Government.

Restrictions on working looms or loom hours.—A notification was issued by the Joint Secretary to the Government of India, Department of Industries and Civil Supplies, towards the end of December, imposing restrictions on working looms or loom hours. Briefly stated, the notification provided that save with the written permission of the Textile Commissioner, no manufacturer of cloth other than handloom cloth, shall work or cause or permit to be worked in his undertaking: (*a*) looms in excess of the number of looms working in the undertaking on 30th September 1944; and (*b*) any loom for a period which in any one month exceeded the average number of hours of work per loom per month in the undertaking during the year ending 30th September 1944.

The effect of this notification was that without the previous written permission of the Textile Commissioner, no cotton mill would be permitted to increase the number of working looms or loom hours beyond the limits attained in September 1944.

In this connection, it was also felt that the cases of mills which had been or were at present manufacturing heavy sorts, like canvas, against defence requirements, deserved consideration. As soon as these orders were completed, the mills concerned would naturally like to switch back to their civilian market, and this could not be done unless they increased the number of looms or the loom hours to absorb the higher count of yarn which would be spun in place of the yarn which they were making for canvas. In this view of the case, it followed that, unless every application for extra loom or loom hours was promptly granted by the Department, the notification would create a very difficult situation for the mills.

The notification, it appeared, sought to defeat the fundamental objectives which Government and the industry had in view when the Textile Control Board and the Cloth and Yarn Control Order were set up. Two of the most important objectives which those concerned had in view when the Textile Control Board was set up were (*a*) to increase the production of cloth; and (*b*) to bring down prices of cloth and yarn to reasonable levels. In other words, both the industry and Government had in view the production of increased quantities of cloth and their distribution at *controlled prices*. There was for the time being no control of prices so far as the handloom industry and its manufactures were concerned, and it was therefore difficult to understand why Government, far from seeking to increase production of mill-made goods, which could be distributed at controlled rates, now sought to put a ceiling limit to such production and increase handloom manufactures where there was no price control. It was not clear whether Government did not consider that the incentive, which was at present being held out by them for the increased production and distribution of handloom cloth, which was not subject to price-control, would not, in its turn, encourage profiteering even in mill-made cloth and drive it into the black market.

Responsible officers of Government including the Honourable Members in charge of various portfolios had repeatedly urged on the Indian cotton textile industry the urgent need of stepping up production, and it was therefore difficult to reconcile these appeals with the notification. The official action of the nature visualized in the notification had for its object the improvement in the productive capacity of the handloom industry at the sacrifice of the Indian cotton mill industry and to the ultimate detriment of the consumer of cloth in this country. A dispassionate consideration of this question and an analysis of all the figures pointed only to one conclusion, viz., that the step taken by Government was ill-advised. If, as was likely, Government's justification for the issue of this notification was scarcity of yarn for the handloom industry, the figures for the year 1943-44 disclosed that sufficient quantities of yarn were available for consumption to the handloom industry. There might perhaps be scarcity in particular Provinces or centres, but the Association felt that this might be due to inadequate transport or unavailability of yarn in the counts in which the handloom industry actually wanted it.

It is understood, however, that, mills producing their own yarn would be permitted to increase their weaving capacity provided they released the normal surplus to the handloom weavers as they used to do hitherto, and that in the case of those mills which formerly obtained their yarn from the market, they would continue to do so without exceeding their normal purchases.

Compensation for involuntary unemployment due to shortage of coal, raw material, etc.—Para 1 (*c*) of the Government proposals for the grant of compensation for involuntary unemployment due to shortage of coal, raw materials or changes in lines of production for which adequate notice cannot be given reads as follows: "The proposals do not cover closures of which adequate notice is given under Standing Orders, whether statutory or voluntary."

In forwarding Government's proposals to the Association, the Commissioner of Labour pointed out that *prima facie* notice of one month would satisfy the requirements of para 1 (*c*). The Commissioner of Labour also referred to paragraph 2 (*b*) of the proposals and stated that repeated closures for 7 days or less separated by short periods would be regarded as not in accordance with the intention of that para.

The Association felt that a month was too long a period for any employer to come to a conclusion that raw materials might not be available on account of transport difficulties. Notices of suspension of work of whatever nature were likely to irritate the workers, and the Committee thought that such contingencies should be avoided as far as possible and notices put up only in cases where they were absolutely essential. If, however, Government insisted on giving a month's notice, it was very likely that notices would be put up which might subsequently turn out to be unnecessary. In the opinion of the Association the best solution of this state of affairs was to reduce the period to 14 days.

Turning to the point made by the Commissioner of Labour regarding intermittent unemployment if Government were of the opinion that a situation was likely to arise under which closures of less than 7 days duration each and separated by short intervals were likely to occur, then the best way of meeting the situation would be to make arrangements even now to avoid it by adopting a more liberal policy in the matter of wagon supplies and a businesslike policy in the matter of placement of orders for textiles for Defence requirements.

As regards the rate and condition of payment, the Association reiterated their view that in the best interests of all concerned, the Government of India should issue an order under the Defence of India Rules, so that there may not be any question of individual provinces acting according to their own wishes and interpretations.

Marine War Risk on Cotton Cloth and Yarn in Transit By Sea.—Recently the Association made a representation to the Textile Commissioner requesting facilities for free marine war risk insurance on cotton piecegoods and yarn which had been withdrawn from 1st May 1944. This was granted but it was available only for the transport of cotton piecegoods and yarn by sea between Bombay and Calcutta and for yarn by sea between Madras and/or Tuticorin to Calcutta. The Association felt that the facility of free marine war risk should be extended to all shipments of cotton yarn and piecegoods sent from one Indian port to another Indian port and that if this suggestion was not acceptable, the concession should at least be extended to cloth as well as yarn which were moved under the special instructions of Government to various destinations by specific sea-cum-rail routes or sea routes. It is understood that, with a view to equalize as nearly as possible the difference between rail and sea charges for the transport of goods, the Government of India have prepared a scheme. First, port-to-port rail rates for the carriage of these commodities will be raised so as to make them comparable to the costs by sea, exclusive of marine war risks insurance charges. Secondly, by arrangement with the underwriters of marine insurance, free marine war risk insurance cover will be provided at Government expense on all consignments of these goods which are sent by steamer or country craft, on the condition that the consignor has at his own cost obtained a policy of ordinary marine insurance from an underwriter of his own selection.

War Risks (Goods) Insurance Scheme—rate of premium.—The question of effecting a further reduction in the rate of premium charged by Government under the War Risks (Goods) Insurance Scheme was considered by the Association.

It was estimated that the Fund had to its credit about Rs. 20 crores, and bearing in mind the fact that the risk of damage by enemy action was now more remote than it had at any time been since the commencement of hostilities, it was thought Government might continue the Insurance Scheme for another year free of premium. The Association stated that they had no objection to a levy being made on the industry if at the end of 1945-46, Government found that the amount standing to the credit of the fund was insufficient to meet outstanding claims.

The rate of premium was subsequently reduced from one anna three pies to one anna for every Rs. 100 per month with effect from the quarter commencing from 1st January 1945 and to nine pies for the next quarter.

War Risks (Factories) Insurance Ordinance—extension of the scheme.—The War Risks (Factories) Insurance scheme was extended for one year with effect from 1st April 1944. The extended period would expire on 31st March 1945. The Association felt that as the danger of damage to property by enemy action was now more remote than ever, and as the fund had a substantial credit balance, Government might not be taking any risks by continuing the scheme for a further period of 1 year free of premium. If the amount standing to the credit of the fund was subsequently found insufficient to meet the claims, there would be no objection to a premium being collected to meet the deficit.

Bombay Government Post-war Development Committee.—Early in January, the Government of Bombay proposed to appoint a committee to co-ordinate the activities of the various authorities in the Bombay City and Greater Bombay in connection with post-war development, but the Association was excluded in the matter of representation on it. The matter was, therefore, taken up with the Government. The Association counted amongst its membership all cotton mills in the city which, apart from making a very substantial contribution to the revenues of the local Government and the Bombay Municipal Corporation, gave employment, directly or indirectly, to a very large section of the population of the city. In this view of the case, Government were requested to grant adequate representation to the Association on the proposed Committee.

Bengal Millowners' Association, Calcutta

New office-bearers.—The following office-bearers have been elected for the year 1945.—President: Mr. B. M. Bagri (Kesoram Cotton Mills); Senior Vice-President: Dr. N. Dutt; Junior Vice-President:—Mr. D. N. Bose; Members of the Committee—Mr. R. N. Dutt, Mr. M. L. Shah, Raisahib S. C. Ghosh, Messrs. G. Chakravarti, D. N. Choudhuri, S. K. Basu and S. C. Roy.

Annual General Meeting.—The 11th annual general meeting of the Association was held on Wednesday the 14th February 1945. Mr. R. N. Dutt took the chair.

The following are extracts from the Presidential address:

"The efforts of the Government in bringing down the cloth prices which soared up to great heights in the year 1943 have been attended with a large measure of success. This has been mainly due to the co-operation extended by the industry itself to Government in enforcing ceiling prices. This self-imposed co-operation is all the more remarkable in view of the fact that this industry has sacrificed large profits arising from the inflationary conditions brought about by the war. Against a background of diminishing profits the Indian mills have been extending constant co-operation to Government as a result of which cloth prices to-day have gone down by over 60 per cent. from the 1943 level.

"But the weakest spot in the whole control scheme is distribution. Although drastic measures have been taken by Government in eliminating unsocial elements of the textile trade, the supply of cloth to the consuming public at controlled rates still remains a baffling problem for the Government. I hope that the new scheme of central distribution will prove to be effective and will ensure supplies of cloth at reasonable rates to the public.

"So far as the distribution of cloth and yarn by the Provincial Government is concerned, I would like to point out that the process of releasing frozen goods has proved to be very slow in practice as a result of which considerable congestion has taken place in the godowns of the dealers. It is hardly necessary for me to point out that in the existing situation of acute scarcity a quicker method of disposal of the frozen goods should be adopted. I would also urge upon the authorities concerned to rely more on the mills and to leave at least 20 per cent. in their discretion for distribution amongst the consumers direct.

"The transport situation both inside the province and outside remained serious, causing considerable difficulty in the movement of goods from the mills to the consuming centres and aggravating the shortage of cloth. In addition to this, restrictions were placed from time to time on the movement of cotton from the Punjab and Sind, which, as you are all aware, are the main supply centres for cotton consumed by the Bengal mills. Similar restrictions were also imposed on the movement of textile products from Bombay to Calcutta by rail. These transport difficulties were to a large extent, if not mainly, responsible for the acute shortage of cloth which is prevalent in this province. As if all these were not sufficiently serious, the railways have, by a notification dated the 15th December 1944, imposed increased freights on fullpressed raw cotton despatched to Bengal from stations on the North Western Railway. Your Committee took up the matter with the railway authorities as well as the Government of India and addressed several communications urging upon the authorities to withdraw the increased rates forthwith. I am glad to state that as a result of representations made by your Committee, the railway authorities have withdrawn the notification by which increased freight rates were introduced on cotton despatches to Bengal.

"The coal situation deteriorated considerably at the end of the year and several mills were on the verge of closing down altogether. Repeated representations have been made to Government in this matter but unfortunately owing to fall in the output of coal, no hopes can be entertained of an early solution of this problem.

"It is hardly necessary for me to point out that this industry which has been subjected to high pressure entailed by the necessity of supplying war requirements, will be in need of heavy replacements during the post-war period. It has been reliably estimated that for profitable operation in the post-war period nearly 50 per cent. of the spinning and weaving machinery will have to be replaced. It is not difficult to visualize that there will be a great scramble for securing machinery on account of the fact that these replacements are also needed by other countries like the U.K., and U.S.A. In these circumstances it is obvious that a large amount of Government assistance will be necessary to enable the textile industry of this country to secure the necessary machinery and other replacements. In view of the fact that this industry has co-operated with the Government to its maximum capacity during this war in supplying vast Defence requirements, I consider that it is only reasonable for the industry to look forward to the Government for active help in the matter of securing urgent replacements in the post-war period.

"As far as the province of Bengal is concerned it is well-known that the number of mills working in the province are not sufficient to cope with the textile requirements of the population. I do not think it is necessary for me to point out the acute hardship felt at the present moment by the civilians in obtaining their supplies of textile requirements at reasonable prices. In these circumstances I appeal to Government to encourage the expansion of the industry in this province by providing all facilities for starting new mills in this province as well as helping the old ones in obtaining the required machinery for expansion and replacements."

Marwari Chamber of Commerce, Calcutta

Third Quarterly Meeting.—The following is an extract from the presidential speech of Mr. R. N. Bhojnagarwala, Vice-President of the Chamber, delivered at the third quarterly general meeting held on Saturday, the 10th February, 1945:—

"Various suggestions with regard to the modification of the E.P.T. have been made to alleviate the crushing burden of taxation on the industry on the lines of what has been done by the Government of other countries. The suggestions include (*a*) that the expenditure incurred for reconverting the industry to peace basis should be allowed as an expenditure, (*b*) that special sums for repairs and renewal which could not be undertaken because of the war should be allowed as a deduction from the E.P.T., (*c*) that the losses in value suffered by the mills in respect of plant and equipment provided as a part of the war efforts should be allowed as a deduction. Besides these, it will also be proper if in view of the promising situation of the war, the War Risk Insurance Ordinance is modified so as to make it less burdensome on the finances of the factories concerned. Already, a huge surplus out of the premia has been built up with the Government. It will, therefore, be fair if some relief is given to the factories in the shape of granting them exemption from the payment of premium for the next year, and thus extend the period of risk to cover the last premium paid as has been done in Australia."

Karachi Chamber of Commerce, Karachi

Textile Imports Price Committee.—Mr. N. A. Tombazi was appointed by Government as a member of the Textile Import Price Committee, Sind.

Joint Adjudication in Trade Disputes.—The Chamber considers that the Government should not include other undertakings in an adjudication that had already been set in motion in another case, if the matter under dispute in the former case had already been submitted to adjudication. Further, the option of being included in the adjudication proceedings relating to another undertaking should rest with the employers.

Cotton Seed.—On the initiative of a member firm the Chamber addressed the Director of Agriculture in Sind on the subject of import of cotton seed from the Punjab for sowing in Sind.

The Agricultural Department had in the past ten years or so encouraged the sowing of two varieties on the Indus left bank, and one on the right bank. Of the former, one, Sind Sudhar, had gone completely out of favour with everybody. It was a poor yielder and therefore the zamindars did not like it. Its ginning outturn was almost a seer per maund *kapas* lower than that of any other variety, which made it unpopular with factory owners, and finally, the quality of its lint had steadily deteriorated over the last few years and mills were no longer keen on it. The other variety, M4, was introduced more recently and was a better yielder and gave a better ginning percentage, but it also had fallen off in quality in the past two or three seasons. While the Committee did not suggest that its cultivation should be abandoned entirely, they did not consider it desirable that only this variety should be grown throughout Sind.

The Chamber observed that the variety grown in the right bank areas, namely, 4F 98, had steadily deteriorated in quality in past years, and at the moment hardly commanded a premium over ordinary 4F. Some years ago, a test at the Matunga Laboratory was made to compare the spinning value of this variety with that of Sind Sudhar, and the result of this test showed very little difference between the two. The fact that its price had sunk to that of 4F was a measure of its deterioration since then. The Agricultural Department did nothing during the past few years to check this decline by making pure seed available to zamindars, and finally during the current season they had abandoned the variety and encouraged the sowing of M4 on the right bank as well. However, this had not so far prevented 4F 98 being sown in this area on a larger scale than all other varieties put together.

The Committee pointed out that upto a few years ago there was little difference in quality between Sind and Punjab 289F, but that of late years the difference had become more and more marked each year, and this was reflected in the prices of the two varieties, the discount on Sind as compared with Punjab being greater than ever before.

One of the most progressive cotton growing estates in Sind proposed to discontinue M4 entirely because they felt it was unsuitable and had found that the quality was deteriorating every year. At the moment there was a difference of about Rs. 6 per maund between the price of M4 and Punjab 287F (roller ginned) in favour of the latter, and when sawginned the difference was about Rs. 10.

As the Agricultural Department were clearly not in a position to supply pure seed of good varieties for sowing on anything like a sufficient scale to satisfy the demands of Sind growers, the Chamber submitted that the import of pure seed from the Punjab and Bhawalpur State should not only be permitted, but also encouraged and arranged.

Factory Environment in England

ON the advice of the Industrial Health Advisory Committee, the Factory Department of His Majesty's Government in the United Kingdom has set up an Information Service concerning scientific and technical developments bearing on industrial health problems. The latest Annual Report (for 1943) of the Chief Inspector of Factories, Sir Wilfrid Garrett, thinks that the post-war planning of "communal factory buildings," blocks of well-designed rooms of convenient sizes for heating, ventilation, lighting, cleaning, maintenance, etc., to be let to small factory occupiers may lead to great improvements in certain trades. Such new tenement factories could have modern layout, power, hoist and other labour-saving devices, communal canteens, and so on.

Ventilation

For many factory buildings, the Chief Inspector suggests natural ventilation can give satisfactory ventilation. The possibilities should be carefully explored instead of the tendency to unnecessary recourse to fans. Ventilating engineers too often regard the ventilation, by fans, as the means of removing dust or fumes. Local exhaust for dust and fumes and general ventilation ought to be clearly distinguished, dust and fumes being removed as far as possible at the source.

Lighting

In 600 factories employing 30 to 250 persons general lighting was adequate in 60 per cent., though with faults of glare in some. Intensities of general lighting were often found much in excess of the minimum, frequently 12 foot-candles and even 20 to 25 foot-candles. In 18 per cent. of the factories major improvements in lighting are required, and in an additional 42 per cent. needed improvements could be made without much expenditure or labour; in most of these cases very little work is done except during daylight hours. Glare due to unscreened lamps remains the most prevalent defect. Cleaning and maintenance are still often neglected; light meter tests on the work would often show a waste of 50 per cent.

Personnel Management

The idea of Personnel Management and Welfare as something additional or extraneous, dealing with the trivial amenities, dies hard. The welfare work itself may be kept in watertight compartments. One welfare supervisor said she did not have meals in the canteen as she was particular about her food ! In more than half the factories the head of the Personnel Department has not normally direct access to the Directorate but has to put his plans and recommendations through someone else, usually the Works Manager. In some cases the Personnel Manager is immersed in detail and becomes an office man with no real personal contact with the employees.

One Personnel Manager reported that the adoption of adjustable chairs with back-rests, instead of stools, increased production by 7 per cent.

Examples are quoted of the influence of good personnel and welfare supervisors in reducing absenteeism.

Improvement of Mill Conditions

A committee has been set up by Sir Wilfrid Garrett, H.M. Chief Inspector of Factories, to inquire into and report on working conditions in cotton mills and to co-ordinate projects for improvements, under the chairmanship of Mr. G. B. Barnett, Deputy Chief Inspector of Factories, with other Home Office representatives, and four representatives each from the employers' and operatives' sides of the industry, and Dr. F. C. Toy, Director of the Shirley Institute. At the first meeting on 20th November four sub-committees were appointed to investigate dust in cardrooms; ventilation, lighting, and general amenities; the reduction of noise, air conditioning, and the wider spacing and the fencing of machinery; and mule spinners' cancer.

The Chief Inspector of Factories has appointed an informal technical committee to consider methods of improving conditions of work in the jute industry.

* * *

The World's Strongest Fibre

THE strongest fibre in the world was used in the recent airborne operations. Its name—"Fortisan," its origin—the same basis as the well-known "Celanese." So far it has not been in civilian life. Right from the early days of the war it has been devoted to Services purposes. In the airborne operations as parachutes it is carrying the tremendous load of supplies—and requires the minimum of bulk and power for its own transport. It is most striking that such diaphanous and really beautiful material can carry such formidable loads. It also produces the lines for suspending the loads as well as for use in barrage balloons. Owing to its super strength its filaments can be made as fine as a spider's thread. Then the electrical industry claims it for some of its newest developments. In the development of radio and electronics its super fineness of filament, coupled with strength and high heat resistance, is contributory to the rapid extension of new or improved designs in electrical apparatus.—*Fibres, Fabrics and Cordage.*

TRADE LETTERS

(*From Our Special Correspondents*)

New Delhi

THERE is a great shortage of cotton cloth at present in the Capital and big crowds besieging the retail shops is a daily sight; I am told only a few persons can manage to get a small quota. The shortage was anticipated in view of the temporary closure of some Ahmedabad mills due to coal shortage and the fact that present production of cloth is only about four-fifths that of pre-war civilian consumption. The hardship of the man-in-the-street in respect of clothing for summer is as great as it was for winter clothing and there is a general feeling that the present cloth famine which is widespread calls for urgent action and a new policy on the part of the Central Government. There were several questions in the Central Assembly regarding cloth control and distribution during the last few days and the Hon. Member-in-charge has promised a new scheme. There has also been a non-official demand in the House for allocation of more yarn for the handloom industry.

Professor A. V. Hill's Visit

Professor A. V. Hill, who was out here on a scientific mission last year, has published a report thereon entitled " Scientific Research in India " which is just to hand. The report embodies notes and suggestions originally submitted confidentially to the Government of India. Professor Hill makes many useful and constructive suggestions and these are now under consideration by a committee set up by the Government of India under the Planning and Development Department. The main feature of the Hill report, however, is the recommendation that " *A Central Organization for Scientific Research* " be established in India as early as possible after the war. This central body, working under the Hon'ble Member for Planning and Development, would formulate a common policy for research. Professor Hill also makes a strong plea for scientific liaison between India on the one hand and the U.K., U.S.A., and Russia on the other and the establishment of Indian Scientific Offices in London, Washington and Moscow. He has stressed the need for increased facilities for sending suitably qualified Indian students for advanced research and training abroad. So far as the textile industry is concerned, Professor Hill has nothing particular to say. One may hope, however, that with scientific research in India reaching full stature in the post-war years, the millowners will not lag behind in the effort to make the maximum use of the results of technical research.

I had an informal talk the other day with Sir Shanti Swarup Bhatnagar at the Secretariat. One of the first things he told me, referring to his recent visit to the U.K. and U.S.A., as leader of the Indian Scientific Mission, was about the wonderful mass-production methods of American industry. In textiles, American cloth is of fewer varieties as compared with the British product but, where cost and production are concerned, Britain compares very poorly indeed with the U.S.A. Moreover, textile machinery development was more advanced in the U.S.A. than anywhere else and, in fact, a committee was set up in Great Britain to consider this subject, and as a result of its findings, it has been decided to scrap the old-type Lancashire machinery and to replace it with newer machines on the American model. India's post-war industrial development had to depend, Sir Shanti remarked, on essential imports of machinery, at least in the initial stages, especially for instance in the setting up of hydro-electric power plants, and her requirements would have to be met mainly by Britain. It was Sir Shanti's impression that American " big business " had little interest in Indian industrial development and that it was up to us to develop a strong national industry.

Ahmedabad

THE system of distribution of cloth which has been applied to Bombay for the last three months has been extended to Ahmedabad from March in order to deal more effectively with black marketing. Permit-holders appointed by the various Provincial Governments are arriving here to make purchases from the quota-holders who receive cloth from the mills. Hitherto the Maskati and Panchkuwa Cloth Markets' Dealers' (Quota-holders') Associations were distributing cloth from the quota-holders to their quota-holders in the consuming centres. No such system was working in Bombay where quota-holders (wholesale dealers) were free to sell cloth to whomsoever they liked.

This encouraged black-marketing considerably, and in order to stop it, Government directed quota-holders of Bombay to sell cloth only to permit-holders appointed by the various Provincial Governments. This system has now been applied to Ahmedabad where up-country quota-holders have been replaced by permit-holders, but the agency of the Maskati and Panchkuwa Markets' Associations for the distribution of cloth has been retained by Government.

It is the general complaint of the merchants that the new permit system evolved by Government is disrupting the old trade channel in the consuming centres while it has been retained in the producing centres. Permit-holders appointed by the various Provincial Governments are inexperienced and are quite new. They are ignorant of the sorts of cloth they come to purchase. They have to take the help of local merchants. If the old trade channel is disrupted in the Province, the industry will suffer during the post-war period after cloth control is removed. The new permit-holders will not be able to handle Indian mill cloth in the face of fierce foreign competition.

I understand that the representatives of the trade and industry are to take up this matter at the next meeting of the Textile Control Board, to which Government have pledged to retain the old trade channel as far as possible. The quota-system devised by Government was intended to retain the old trade channel, and there is no reason why, it is contended, the new permit system should seriously disturb the old trade channel to the lasting disadvantage of the industry. The old trade channel which has served the industry for years through thick and thin, once disturbed, cannot be restored so easily. The Central Government that has already recognized the importance of the old trade channel will therefore be earnestly pressed to impress upon the Provincial Governments its importance and to exercise its authority to restore it wherever it has been replaced.

With the introduction of the permit system, the deficit and the surplus areas are to be put on a level of equality with regard to the supplies of cloth. The Bombay Province, which is a surplus area, is to receive cloth on the basis of 18 yards per head as against 10 yards for Bihar, 18 yards for the Punjab, etc. The distribution of cloth is to be rationalized and not rationed according to the Textile Commissioner, on the principle of "equality of sacrifice" of the consuming centres. A feeling of uneasiness prevails among the surplus areas, but they should look to the plight of the deficit areas where cloth famine prevails. There is no other remedy to relieve the cloth famine except to put the surplus areas on an equal level with the deficit areas. As the distribution system is perfected all Provinces will feel equally the pinch of cloth famine, which only the deficit Provinces at present experience more acutely.

Khadi Production must be Increased

After distribution comes production. There is a limit to which mill production can be increased, though recently it has been reduced by coal shortage. But there is no limit to the increase in the production of *khadi*. It is regrettable that no comprehensive scheme is being prepared to step up production by the handloom. India has still to pass about three years of cloth famine which she can utilize to build up her textile industry so as to stand the post-war depression better than she did after the end of the last war. Government control has saved the industry from the sudden crisis which befell the industry immediately at the end of the last war. The industry has been subjected to voluntary cuts which has reduced abnormal profits to normal levels. No more cuts are to be enforced but distribution is to be regulated. The industry which would have been tossing up and down has been steered through calmer waters which would not imperil its existence when there is the ebb after the war. Hand spinning and hand weaving industry would have profited equally if a serious attempt had been made to revive it all over the country. Even now it is not too late.

Textile Labour Association

The Textile Labour Association is coming to grips with the Ahmedabad Millowners' Association on the three main issues—bonus for 1944, compensation for stoppages due to coal shortage and better conditions for night-shift workers. These three issues have been referred to the Conciliator for conciliation which is compulsory under the Industrial Disputes Act passed by the Congress Government when it was in power in Bombay. One of them—the bonus question—has failed to evoke an agreement, and the Labour Association has demanded arbitration thereon. If the Millowners' Association refuses it, the Labour Association will declare a general strike. But the Government is not likely to allow a general strike in an important industrial centre like Ahmedabad. The Governor of Bombay interfered when a general strike was imminent on the question of dearness allowance on the outbreak of war, and he persuaded the Millowners' Association to accept the arbitration demanded by the Labour Association. History may repeat itself on the three main issues in dispute between the two bodies which will be ultimately referred to arbitration.

The Labour Association, however, has gone a step further this time, and has demanded a sort of agreement with the Millowners' Association to refer all disputes in future to arbitration. A permanent system of arbitration such as existed in Ahmedabad before the passing of the Industrial Disputes Act is aimed at by the Labour Association. The Millowners' Association refused to accept arbitration as soon as the Industrial Disputes Act made it voluntary. The Millowners' Association which once accepted the system of arbitration for the settlement of all disputes under the inspiration of Mahatma Gandhi who resorted to a fast was long smarting under the series of awards which the working of the arbitration system created in Ahmedabad. These awards imposed a strain on the mills which were repeatedly called upon to enforce them. The mill agents who had never before felt the authority of a human agency resented the authority of the arbitrators perpetually hanging over their heads. One of the arbitrators was Mahatma Gandhi himself, to whom they were forced to run every now and then. Mahatma Gandhi gradually extracted from them the highest wages in India and other concessions which they found too costly for them to bear. They consequently took the first opportunity to free themselves from the shackles of the arbitration system which the Labour Association seeks again to impose on them.

They will undoubtedly put up a tough fight, but war is not the time for a fight with labour. They have put up with many inconvenient things during the war such as the highest dearness allowance on the top of the highest wage scale in the country, and they will put up with one more inconvenience of arbitration system, but they will make determined efforts after the war to ease the burdens imposed on them under the stress of war.

Local labour leaders who have been conducting the Labour movement on the principles of Mahatma Gandhi for over two decades, have formed an all-India body called the Hindustan Mazdur Sevak Sangh to guide labour movements on similar lines in all industrial centres in the country. Mr. Vallabhbhai Patel is the President and Mr. Gulzarilal Nanda, Secretary of this body. It aims at "not only the advancement of the legitimate interests of the workers, but also the true well-being of the entire community," and "will devote its attention to the moral and cultural uplift of the workers and development of their character, as well as to the improvement of their material condition." It will resort to direct action only when the application of the principle of arbitration on fair lines is not available. The local Labour Association has been conducted on these principles, and they are now sought to be worked out in other industrial centres. Will they precipitate a conflict with other trade unions that are already working on different lines in the country?

Cawnpore

Post-war Schemes

ADDRESSING the annual general meeting of the Merchants' Chamber of the United Provinces, Sir Maurice Hallett, Governor of the Province, gave an account of the various steps that have been taken by the Government to ensure a smooth and orderly transition of the economy of the Province from war-time footing to peace-time stability. "The ultimate aim of our post-war plans is to raise the standard of living and increase the general prosperity of the country," he observed, but "the immediate object is to make the switchover from war to peace production, and to provide for the lakhs of men who will be demobilized from the fighting forces, and from war industries." He announced that the Government was planning to spend Rs. 125 crores on post-war development schemes during the first five years after the termination of the war.

Mr. Uma Shanker Mehrotra, the President of the Chamber, delivered a comprehensive address reviewing the commercial and industrial progress made by the Province in recent times. He congratulated the Government on "the very wise financial policy pursued by them which has culminated in the strength and expansion of the Provincial finances in such a manner that the post-war schemes of the Province could be started on an even keel without unduly straining the progressive development of the province, and without having recourse to such extra burden of taxation, as would deepen the slump and make the province poorer."

Mr. Uma Shanker Mehrotra was elected President, and Lala Lakshmipat Singhania of the J. K. Group of Mills, Vice-President.

Cloth Control

The cloth situation in the Province has very much deteriorated. As reports in the Press go to show, there is a virtual cloth famine in 34 districts of the Province. As a consequence of the operation of the new cloth distribution scheme, Bombay and Ahmedabad cloth mills are to supply cloth to U.P., but supplies from Ahmedabad have not arrived as yet which has resulted in great dislocation of the entire trade. The Government have also cancelled the United Provinces Standard Cloth Control Order, whereby the need for obtaining a separate licence to deal in this have been removed. Cloth dealers licensed under the U.P. Cotton Cloth and Yarn Control Order can now deal in standard cloth provided that prices charged for the cloth do not exceed the maximum retail prices fixed by the Government from time to time.

The Government have, it appears, prepared a new scheme for the distribution of yarn to weavers. A recent Government notification requires dealers in yarn to furnish to the Government and to District Magistrates figures of total sales of mill-made yarn and sales to consumers only during the years 1940, 1941 and 1942 in the prescribed form. Dealers have been advised to submit the returns at a very early date. Two new cloth control orders have also been recently issued by the Provincial Government:

(1) No wholesale dealer within the limits of Cawnpore Municipality shall sell or deliver any cotton cloth received by him from Ahmedabad except to persons specified by the Deputy Secretary, Civil Supplies Department.

(2) Every such wholesale dealer shall, within three days of the issue of this Order, deposit with the Additional District Magistrate, Cawnpore, a list showing the quantity and description of the goods which he has received from Ahmedabad.

It is announced that under the latest provisions of the Cotton Cloth Movements Control Order no person is permitted to take more than 20 pounds of cotton cloth (excluding cloth made up into garments) as personal luggage by rail from U.P. to any other province except Bihar, Bengal and Punjab.

Calcutta

Post-war Stabilization of Bengal's Industries

THE Bengal Provincial Indigenous Manufacturers' Conference have decided to call upon the Government of India to define their policy clearly in relation to post-war stabilization of such concerns as had, despite risks and difficulties, played an efficient part in implementing the war programme. The Central and Provincial Governments were urged to purchase indigenous materials even in such cases where they might not be absolutely equal in quality or price (not exceeding 5 per cent.) to imported materials. This arrangement should continue at least for two years at present. The Conference further decided to urge on the Government to formulate and immediately give effect to such fiscal measures as might be truly calculated to strengthen and consolidate the position of Bengal industries *vis-a-vis* possible foreign inroads in the post-war period.

Sales Tax on Khaddar

Exception is being taken in representative quarters to the proposal for imposition of sales tax on khaddar. It is argued that millions of people depended for their livelihood on khaddar and they are mostly men of very poor resources. In these days of cloth shortage not a small number of people depend absolutely upon khaddar for their wearing. To impose sales tax on khaddar would be a tremendous hardship both on the producers and consumers of khaddar.

Future of Trade and Industries

Matters of far-reaching importance were discussed in the meeting of the All-India Manufacturers' Organisation presided over by Sir M. Visveswaraya. The efforts of the Government towards economic planning were welcomed but it was felt that the measures taken were not at all commensurate with the country's requirements and potentialities. The Government were urged to scrutinise carefully and give effect to the long-term plan of the Bombay industrialists and the Manufacturers' Organization which aimed at trebling the national production by fostering intensive development of industries and modernization of agriculture. It was suggested that Government should constitute for this purpose three bodies—a Reconstruction Commission, an Economic organization comprising a separate Central Department of Industries and a National Reconstruction Board.

Distribution of Yarn

It is understood that a programme for distribution of yarn to weavers in Bengal has been drawn up on the basis of 6,000 bales of yarn being available per month for the whole Province. As this supply is inadequate, the Government of Bengal are reported to have taken up the question of larger supply of yarn to Bengal with the Textile Commissioner. At the instance of the Minister-in-charge, Mr. S. C. Roy, Chairman of the Bengal Textile Advisory Committee, entered into negotiations with the Government of Madras for the supply of yarn and succeeded in arranging a supply of about 10,000 bales every month. Even these supplies were not sufficient to meet the requirements of the Province. The position, it is understood, has now become far worse following the recent conference held by the Textile Commissioner at which it was decided to scale down Bengal's quota, which will henceforth be 5,442 bales of yarn per month. Owing to the prevalence of black market in yarn the Government of Bengal are freezing all yarns available in the Province and are arranging for supply thereof in the subdivisions to the weavers on the quota basis, non-spinning weaving mills and a few miscellaneous fabricators. Under the new distribution programme the allocations made to the different centres are so small compared to their needs that, it is apprehended, a substantial section of weavers are likely to go out of employment unless larger supplies are assured to Bengal.

Comments on the Scheme of Government

The view that the Government distributive machinery has been a total failure and that maldistribution on the part of the Government has been responsible for such a crisis to the detriment of the weavers, has been expressed by the Calcutta Yarn Merchants' Association in the course of a communication to the Provincial Textile Controller. The apprehension of the Association is reported to have been strengthened by the fact that approximately 10,000 bales of yarn are lying in the market undelivered. The Association has requested the Government to make immediate arrangements to send these goods to the mofussil area.

Creation of the Jute Fund

The Indian Central Jute Committee have decided to approach the Government of India to create a Jute Fund, to allocate to it a rupee per ton out of the existing export duty on jute and jute goods, and to place the entire proceeds of the fund at the disposal of the Committee. It has also been decided to undertake investigation of the possibilities of manufacturing jute or jute-cotton-union fabrics as the Technological Laboratories of the Committee have succeeded in spinning fine yarn from jute.

Jute Industry in Retrospect

Presiding over the annual general meeting of the Indian Jute Mills' Association, Mr. W. A. M. Walker reviewed the position of the trade and industry during the last one year and observed that the jute mills, in support of war efforts, were producing a wide range of by-products,—from parachutes to tea chests and from five-gallon drums to aerodrome runways. Throughout the year, except for one very short period, jute prices had been well maintained and even though it was likely that these prices would be maintained for another year he warned that the growers must be ready at the same time for the future when the generally expected fall in prices of all commodities will materialize. Despite coal difficulties, manufactures during the last year totalled 1,050,000 tons or 150,000 tons below the target figure of 100,000 tons monthly. The coal situation had been so acute that, according to the President, some mills in the Association worked only for five weeks out of the past seven months. The Association was disappointed to find that even though it was promised that better supplies would be available whenever production was increased and that it would have the first claim on increased raisings, the assurance was not honoured by the Supply Department. The Chairman urged that it was a very unhappy state of affairs and called for immediate action by the Supply Department. Stocks of manufactured goods stood on 1st January 1944, at 221,304 tons and on 31st December at 169,012 tons so that they had disposed of 1,102,000 tons during the year.

Fixation of Jute Acreage and Prices

As a result of the discussions of the representatives of the Government of Bengal with the Government of India, important decisions have been reached and just announced. They are:—

(*a*) The Bengal Government will, as in the previous year, issue orders for the licensing of an acreage of eight annas on the basic average of 1940 and will advise and encourage the agriculturists to plant fully upto the acreage in their own interests. (*b*) The India Government will guarantee a minimum price of raw jute on the basis of Rs. 15 per maund of middles at Calcutta and at the appropriate parity price at the selected principal jute purchasing up-country centres, details of these selected centres and the minimum parity prices being announced later on. (*c*) The India Government will undertake to buy all crop offering, old and new, at Calcutta and selected up-country centres and in Bengal with a view to maintaining prices at minimum level at Calcutta and at the appropriate parity prices in the selected up-country centres. (*d*) The India Government will fix a minimum price of raw jute on the basis of Rs. 17 per maund of middles at Calcutta (other qualities or grades of raw jute to be in parity with this price) with the right of the India Government to requisition on the basis of the maximum price. The Government of Bengal will assist in such requisitioning from middlemen if necessary. (*e*) The Jute (Price Control) Order, 1944, fixing maximum selling prices for manufactured jute goods will remain in force. (*f*) This agreement will remain in force between the two Governments till 31st March 1946.

Labour in Jute Mills

That labour in the jute mill industry remains on the whole in a comparatively contented state is emphasized by the Chairman of the Indian Jute Mills Association. The industry claims to have all along taken steps to meet the conditions imposed upon labour through shortage of food supplies and high prices and in pursuance of this policy the cash allowance has recently been stepped up from Re. 1-4 to Rs. 2 per week, the additional cost to the industry being nearly Rs. 1,15,00,000 per annum. The Labour Officers' Scheme has functioned successfuly during the past year and the Special Labour Committee of the Association has decided that the most important problems to be given prior consideration should be the setting up of conditions of service for all workers, the preparation of a scheme for the provision of pensions or gratuities to workers after retirement, standardization of wages and establishment of personnel departments in all mills. This was to be regarded as the immediate short-term policy of the industry in relation to labour. It was further stated that conditions of service have now been drawn up and, subject to favourable comment from the Provincial Government, it was hoped to introduce these on 1st April.

Tibet's Share from Bengal's Quota

The Government of Bengal, it is understood, are freezing a large quantity of textiles out of the quota fixed for Bengal for supplying the same to Tibet. This, it is further reported, the Provincial Government are doing in pursuance of instructions given to them by the India Government. So far about 400 bales of textiles have been secured for Tibet for which country the Government of India is said to have fixed the quota.

Spinning Mills for Bengal

The Bengal Minister for Industries has revealed that the Government are contemplating to set up two spinning mills in the province for supplying yarn at cost price to handloom weavers as a remedial measure to meet the scarcity of the yarn. It has further been stated by the Minister that they have also accepted a scheme for opening Government depots in each district for direct supply of yarn to weavers and for organizing marketing of their products and that a Deputy Director of Industries will soon be appointed for that purpose.

Returns of Yarn Consumption

In order to ensure that Bengal may get her quota of yarn the Textile Commissioner has requested the Government of Bengal to supply him with the following information:—(*a*) Total number of handlooms installed in the province upto 30th September 1939 and upto 30th September 1944. (*b*) Total number of power looms not situated with or forming part of a complete mill with spinning plants in operation in this Province upto 30th September 1939 and upto 30th September 1944. (*c*) Total number of hosiery machines installed in Bengal upto 30th September 1939 and upto 30th September 1944. (*d*) Consumption by weight of yarn for all other miscellaneous purposes for the year ended 30th September 1939 and for the year ended 30th September 1944. (*e*) Estimate of total monthly requirements of yarn for all the above categories at present, details being given of counts, both single and folded, within groups varying between 1s and 61s and above. (*f*) Estimated monthly production of cloth in lbs. and in yards based on (*a*) above and estimated monthly production of cloth in lbs. and in yards based on (*e*) above.

Bengal Cotton Cloth and Yarn Control Order

The Bengal Civil Supplies Department has announced that all existing licences under the Bengal Cotton Cloth and Yarn Control Order, 1943, that are due to expire on the 31st January 1945, have been, for administrative reasons, extended till 31st March 1945 by a recent order passed by the Government under D. I. Rules.

Textile Business in Bengal

Plans for equitable distribution of cloth and yarn were discussed by the Provincial Textile Advisory Committee. The Chairman of the Committee referred to the extreme shortage of cloth and yarn in Bengal, the difficulties that stood in the way of equitable distribution and suggested that to secure proper distribution it might be necessary to eliminate the large number of unnecessary links in the trade channel.

The efforts of the Government are, however, discounted by the Calcutta Piecegoods Merchants' Association who are of the opinion that in view of the fact that a number of notifications and circulars have been or are still issued by the Provincial Textile Controller in respect of the textile business it would have been but meet and proper if the merchants and the chambers were consulted at the outset regarding the propriety and feasibility of the new directions. According to the Association, the requisition policy adopted in the middle of September last in respect of goods of finer counts has given rise to the black market much to the detriment of the wholesale dealers and the consuming public.

Cotton for the Bengal Mills

The cotton mills in Bengal have to depend entirely on the Punjab and Sind for their cotton requirements. Very great difficulties are felt by them in getting the supply of cotton due to transport difficulties. To add to these difficulties, the N.W.R. authorities have now increased the freight for full-pressed raw cotton despatches from stations on that railway to Bengal with effect from 15th December 1944. The reasons for this increase in freight are not known but it is strongly opposed from all quarters in Bengal. It is argued that India's textile mills are functioning under an all-India control, that the prices of yarn and cotton and cotton textiles are controlled on an all-India basis and that there are fixed ceiling prices. If the imposition of increased rates is supported by a corresponding enhancement of the ceiling rate there is nothing to say. But if it means an additional burden on the Bengal mills it will look like discrimination against the Province's textile industry. The Bengal Millowners'

Association have made due representations to the Government of India.

Millowners Meet

Presiding at the annual meeting of the Bengal Millowners' Association, Mr. R. N. Dutt referred to the hardships of the civilian population in obtaining their supplies of textile requirements at reasonable prices. He said that the weakest spot in the whole control scheme was distribution and that although drastic steps had been taken by Government to eliminate undesirable elements from the textile trade the supply of cloth to the consuming public at controlled rates still remained a baffling problem for the Government. So far as the distribution of cloth and yarn by the Provincial Government was concerned the process, he emphasized, of releasing frozen goods had been very slow in practice, resulting in considerable congestion in dealers' godowns. He suggested that in the existing state of acute scarcity a quicker method of disposal of frozen goods should be adopted and that the authorities should rely more on the mills and leave at least 20 per cent. to them for distribution among the consumers direct.

South India

Government Urged to Take Over Mill

THE Madras paper, the *Mail*, says that a deputation of local labour leaders waited on the Hon'ble Sir A. Ramaswami Mudaliar, Supply Member, Government of India, on 9th February 1945 and represented the need for the Choolai Mills, Madras, being taken over, either by the Government of India or by the Madras Government, at least for the duration of the war. The deputation pointed out that, while the Supply Member urged that more cloth should be produced to meet the demands of the people, one of the biggest mills in the city of Madras, the Choolai Mill, was idle. There were 40,000 spindles and 700 looms in the mill and they were kept in good working order by Mr. Indira Singh, of Calcutta, who bought the mill for Rs. 22 lakhs. It was up to the Government to take it over and run it as in Bombay, where the Provincial Government had taken over 10 mills.

The Supply Member gave a patient hearing and promised to take up the matter in the Executive Council. Meanwhile, he asked the deputation to send a memorial to the Commerce Member. It may be stated that a deputation has also proceeded to New Delhi to interview the Commerce Member.

Cochin Cloth Merchants

Appreciation of the working of the Piecegoods Merchants' Association, particularly the harmonious relationship between the Association and the textile control authorities in Cochin State, was expressed by Sir George Boag, Dewan, presiding over the first annual meeting of the Association at Ernakulam. He congratulated the Association on its successful working and was glad that they had realized the need of control in an emergency like the present. He agreed with them that clothing was as necessary as food, and its production and distribution was important. The greater part of the work done by the Association during the year was carried on in a friendly spirit which had brought about a better and more harmonious working of the control regulations.

The Dewan agreed with them that the control orders should be published in the local vernacular.

Success of Textile Control in Madras

"I find that Madras has acquired a good reputation all over India for the manner in which her people and her Government carry on their business," said Mr. S. V. Ramamurthi, Adviser to H.E. the Governor, inaugurating the Madras Retail Piecegoods Merchants' Association on 25th January in Madras. Mr. Ramamurthi also stated that the Government of Madras had taken up the question of revising the quota of cloth for the province.

After thanking the members of the Association, Mr. Ramamurthi said: "It is satisfactory that in this province the production and distribution of yarn and cloth, wholesale and retail, are being organized, in a manner which helps all concerned. This position has not been reached without unremitting care and effort on the part of the Provincial Textile Commissioner and his staff and it continues to need all their vigilance and energy."

Till about the middle of August last there was quite a serious amount of black-marketing in yarn in this province and movements of yarn unrelated to the demands in the various weaving centres were taking place, with the result that it was difficult to secure steady supplies of yarn at controlled prices even in the large markets. The Provincial Textile Commissioner had, therefore, to introduce comprehensive control of the distribution of yarn. This scheme, called the District Quota Scheme, has been in operation from the latter part of August last. If we have not secured 100 per cent. success under this scheme as regards steady supplies, it is largely because of railway transport difficulties.

On the whole it can, however, be claimed that, thanks to this control of distribution from the mills downwards to the retailers, black-marketing in yarn has practically disappeared. No area can get more yarn than the Provincial Textile Commissioner has allocated to it, and there is complete control over what every dealer buys and sells, the requirements of each consumer of yarn being distributed as under a rationing scheme. A scheme for the regulation of despatches of yarn and piecegoods from Coimbatore is being introduced by the Provincial Textile Commissioner and this is expected to improve considerably the position as regards movements of yarn to the various weaving centres.

The Tamiland Provincial Handloom Weavers' Conference was held at Karur on 29th January under the presidency of Prof. N. G. Ranga. In the course of his presidential speech, Prof. Ranga adverted to the advice given by Sir A. Dalal to Madras capitalists to start more weaving mills and observed: "This attitude of the Government must be countered by all who are interested in the welfare of our weavers."

Restrictions on Cotton Cultivation

The following Press note has been issued by the Madras Government. The Government have prohibited the cultivation of Buradapathi (Sannapathi) cotton completely in Vizagapatam District.

They have also prohibited the cultivation of *mungari* cotton in the districts of Bellary, Anantapur, Kurnool and Cuddapah and of Cocanada cotton in the Guntur District except as a mixed crop in the proportion of one line of cotton to at least two lines of food crops.

In order to compensate the ryots on account of the above restrictions on the cultivation of cotton, the Government have now sanctioned the payment of a bonus of Rs. 2 per acre during 1944-45 in respect of lands in which pure cotton would normally have been grown in the districts of Vizagapatam, Guntur, Bellary, Anantapur, Kurnool and Cuddapah and cotton mixed with food crops in Vizagapatam District but for the above restrictions.

The bonus will be paid to the actual cultivator, whether a registered holder or not. If the registered holding is cultivated both by the registered holder and others, the bonus will be apportioned *pro rata* in accordance with the proportion cultivated by each. The grant of the bonus is purely *ex gratia.* In eligible cases the bonus will be paid to the ryot by the Revenue Department without any application.

Fair Price Cloth Shops in Mysore

The Mysore Government have approved of a scheme for the opening of a limited number of fair price shops in the State for the purpose of checking black market in cloth and making readily available to consumers at reasonable prices cloths which are in short supply in the market. Twenty-three shops, of which 6 will be in Bangalore City and 3 in Mysore City and 2 in each of the other district headquarter towns will be opened as soon as possible. Only approved dealers of standing and reliability, who are already in the business, will be permitted to open these shops.

The approved dealers have to give an agreement to run the shops as per circulars and instructions issued, from time to time, by the Additional Textile Commissioner with reference to the limits of quantities to be sold to each individual, minimum stocks to be maintained, rates to be charged, maintenance of accounts, etc. They have also to furnish a security deposit of Rs. 2,000, for the proper running of the shops. In these shops cloth can be sold to consumers only and cannot be resold to any dealer or hawker nor can it be dyed or printed by the dealer. Supplies to the shops will be made generally at about three bales per month and will, as far as possible, include several varieties.

The selection of the shop in each place will be made with reference to the suitability of its location, the experience, standing and reliability of the dealer, and his ability to run the shop satisfactorily, availability of suitable establishment, existence of adequate business contacts, etc. A selection committee will be constituted for each district with the Deputy Commissioner as Chairman and four members. The decision of the Additional Textile Commissioner regarding the selection of the shops will be final.

Starch Manufacture—Travancore

The Travancore Government propose to keep in view the following objectives in the administration of the Tapioca Starch Control Order:—In the first place it is imperative that there should be no deterioration in the present food situation. The action taken by the Government to ensure adequate supplies of tapioca at reasonable rates has helped the State in no small measure to get over the food crisis. The greatest care will be taken hereafter also to see that for the next six months only a comparatively small proportion of the total production of tapioca is diverted to the manufacture of starch. Secondly, it is the intention of the Government that a steady market should be created and maintained for the Travancore tapioca starch. The high quality of the starch exported has, therefore, to be maintained and the starch will be subjected to rigorous tests by experts in order to set a standard and to fix a minimum quantity. A few large-scale factories will also be permitted to manufacture tapioca starch and starch products. The essential character of the industry as a cottage industry will be safeguarded by allotting nearly two-thirds of the purchase quota to co-operative societies and individuals on a cottage industry basis.

Raw Cotton Statistics

The receipts of loose cotton at present and spinning mills in the Madras Province from 1st to 16th February 1945 amounted to 15,125 bales of 400 lbs. lint. The receipts in the corresponding period of the previous year were 10,902 bales; 26,217 bales mainly of pressed cotton were received at spinning mills and 1,194 bales were exported by sea while 8,649 bales were imported by sea mainly from Bombay.

Supply of Yarn to Weavers

Mr. S. Venkateswaran, Provincial Textile Commissioner, Madras, in reply to a memorandum submitted by the Madras Provincial Handloom Weavers' Association on 31st January, has stated that he has issued instructions to Textile Control Officers requesting them to furnish on application by the Provincial Handloom Weavers' Association or any representative local weavers' association information regarding the quantity of yarn (by counts) received in the district during any month. They are further asked to form advisory committees in every district weavers' centre to help them in the preparation of distribution lists of consumers: the committees should be fully representative as indicated in his scheme for controlled distribution of yarn to weavers. The Textile Control Officers have also been asked to issue ration cards to weavers under their signatures if the committees agree to the ration card system. The non-working members of weavers' co-operative societies should be linked up with local retailers just like weavers who are not members of co-operative societies obtaining a certificate from the co-operative society to the effect that these weavers are not working in the society. The weavers who have shifted from famine areas to other districts, when settled with their looms, should be treated as permanent residents of the respective districts and they should be included in the consumers' lists for supply of yarn.

Indian Mill Finance

Working of Textile Companies

Pulgaon Cotton Mills Ltd., Pulgaon

(Agents: Hardayal Nevatia, Bombay)

The working of the Company for the period ended 30th June 1944 shows a profit of Rs. 9,40,687-12-10 after meeting all expenses including interest, depreciation, Managing Agents' commission, dearness allowance and bonus to employees. Out of this sum Rs. 8,95,000 have been appropriated to income-tax, super-tax, E.P.T. and provision for E.P.T. deposit. This leaves a balance of Rs. 45,687-12-10 which together with Rs. 5,002-5-2 last year's carry-over amounts to Rs. 50,690-2. The Directors recommend to distribute the same as follows: Dividend on 40,000 shares at Re. 1 per share, free of income-tax Rs. 40,000; provision for charity Rs. 5,000; and balance to be carried forward Rs. 5,690-2.

During the period under report there was a labour strike in the mill for about 7 weeks, as was the case with almost all other mills of C.P. and Berar. In spite of this strike the result of the working has been satisfactory.

Birla Cotton Spinning and Weaving Mills, Limited

(Agents: Birla Brothers Ltd., Calcutta)

After debiting interest and commission, providing for reserve for taxation, setting aside depreciation and making sundry adjustments, the combined revenue and profit and loss accounts for the half-year ended 31st December, 1943 show a profit of Rs. 8,27,208-0-7, which includes the revenue results of the company's Jaipur branch and Bhatinda depot not transferred to British India. This amount, together with the balance of the previous half-year, shows a total profit of Rs. 15,61,013-4-2, from which after deducting the amount of dividend already declared for the half-year ended 30th June 1943, there remains a balance of Rs. 14,11,013-4-2. The Directors recommend a dividend on 150,000 ordinary shares at Re. 1 per share, free of tax Rs. 1,50,000 and to carry forward Rs. 12,61,013-4-2.

There was a substantial fall in the prices of cloth in the period under report which has affected and will in future affect the financial results of the company.

Jam Shri Ranjitsinghji Spinning and Weaving Mills Co., Ltd., Sholapur

(Agents: Lalji Naranji & Co., Bombay)

During the year ending 30th June 1944 the company has made a profit of Rs. 34,99,053-0-2. Adding to this the balance of Rs. 30,311-15-11 brought forward from the previous year the total comes to Rs. 35,29,365-0-1. Deducting from this, Rs. 77,700 for interim dividend already paid for the half-year ending 31st December 1943 at Rs. 100 per share, there remains a balance of Rs. 34,51,665-0-1. Out of this sum the Directors have set aside:—Towards building depreciation fund Rs. 30,000 ; machinery depreciation fund Rs. 50,000; reserve fund Rs. 5,00,000 and provision for taxation Rs. 27,00,000, leaving a balance of Rs. 1,71,665-0-1 which they recommend may be dealt with as under:—To dividend at Rs. 100 per share on 777 shares of the company Rs. 77,700; bonus to employees Rs. 50,000 and carry to next year's account Rs. 43,965-0-1.

The allocation to reserve fund makes provision for the compulsory E.P.T. deposit with the Government of India which is to be made in respect of the company's year ending 30th June 1944.

The mill buildings, machinery, stock and stock-in-process are insured against risk of fire for Rs. 42,55,500. The same are also insured against war risk. The profits and fixed charges have been insured for the period of 12 months for Rs. 10,00,000.

Broach Fine Counts Spg. & Wvg. Co., Ltd., Broach

(Agents: Brijlal Bilasrai & Co., Bombay)

The working of the company for the year ended 31st March 1944 shows a profit of Rs. 13,78,996-14-9 without providing for depreciation.

Against the profits of 1942-43 and 1943-44 there is the liability for income-tax, super-tax and excess profits tax for the two years amounting approximately to Rs. 18,00,000. Further under section 10 of the Finance Act, the compulsory deposit for the two years works out at about Rs. 3,40,000. Taking into account also the fact that depreciation on the fixed assets of the company must also be provided out of the profits of the year, the Directors recommend a dividend of Rs. 10 per share out of the profits of the year 1943-44.

The company's property including building machinery and stock have been insured against fire for Rs. 58,72,500 only. Under the War Risks Insurance Ordinances, the company's buildings machinery and stocks are also insured.

Muir Mills Company, Limited, Cawnpore

(Managing Director: K. J. D. Price)

After providing for a bonus to employees and setting aside Rs. 67,00,000 for estimated taxation, Rs. 16,00,000 to general reserve and Rs. 50,000 to pension and gratuity fund, the result of the working for the year ended 31st December, 1944. is a profit of Rs. 6,64,632-11-5. Adding to this Rs. 4,83,679-1-4, being the balance brought forward from 1943, there is a sum of Rs. 11,48,311-12-9 available which the Directors have allotted as follows:—

Ad-interim dividend of Re. 1-8 per share on the preference shares, and Rs. 5 per share on the ordinary shares to 30th June (both free of income-tax) Rs. 1,95,000; leaving for disposal a sum of Rs. 9,53,311-12-9, which they propose to deal with as follows:—Final dividend of Re. 1-8 per share on the preference shares (free of income-tax) Rs. 45,000; final dividend of Rs. 5 per share on the ordinary shares making 20 per cent. for the year (free of income-tax) Rs. 1,50,000; bonus of Rs. 10 per share on the ordinary shares (free of income-tax) Rs. 3,00,000; bonus to Directors Rs. 10,000 and to carry forward Rs. 4,48,311-12-9.

Madhusudan Mills, Ltd., Bombay

(Agents: Messrs. Amersey Damodar)

The working of the company for the year ended 30th June, 1944, shows that after debiting a sum of Rs. 1,00,000 for depreciation fund there is a profit of Rs. 84,02,030-4-7, which with Rs. 71,22,294-11-0 (subject to taxation) brought forward from the previous year's account makes a total of Rs. 1,55,24,324-15-7. From this is deducted the amount of taxation paid in respect of accounting year ending June 1942 of Rs. 18,62,680-8 and the final dividend at the rate of Rs. 15 per share of Rs. 100 each and Rs. 3 per "B" share of Rs. 20 each, free of income-tax for the year 1943 amounting to Rs. 3,24,000 and an *ad-interim* dividend at Rs. 12-8 per share of Rs. 100 each and Rs. 2-8 per "B" share of Rs. 20 each, free of income-tax to 31st December, 1943 of Rs. 2,70,000 and the provisional excess profit tax paid for the year 1942-43 of Rs. 31,00,000 leaving a balance of Rs. 99,67,644-7-7. Out of this sum the Directors recommend payment of final dividend at the rate of Rs. 12-8 per share of Rs. 100 each and Rs. 2-8 per "B" share of Rs. 20 each, free of income-tax, which will absorb Rs. 2,70,000 and leave a balance of Rs. 96,97,644-7-7 subject to taxation to be carried forward.

Capital expenditure incurred during the period under report amounts to Rs. 27,101-3, being the cost with expenses for purchasing 1,614 sq. yards of land from Sir Ness Wadia, K.B.E.

A property on the north and west sides of the mill, admeasuring about 2578 sq. yds., having three small workmen's chawls, fetching a monthly rent of about Rs. 600 has also been purchased for Rs. 88,000 plus usual costs.

Insurance against war risk, riot, civil commotion and fire risks, loss of profit and standing charges and boiler and steam apparatus explosion risk have been taken for machinery, buildings, stock of cotton, yarn, cloth, waste, etc.

Kohinoor Mills Co., Ltd., Bombay

(Agents : Killick Nixon & Co.)

The working of the company for the year ended 31st December, 1944 shows that the profit for the year after deducting depreciation amounting to Rs. 5,03,365 based on the income-tax statutory allowances is Rs. 1,38,11,410. From this amount the Directors have set aside for special depreciation Rs. 2,50,000; as provision for taxation Rs. 1,05,64,000, and towards the estimated compulsory deposit of Rs. 23,60,564 payable to the Government of India under section 10 of the Finance Act, 1942 by transfer to machinery reserve Rs. 12,50,000. To the amount thus left is added the balance brought forward from last year of Rs. 1,03,873. Finally, the amount paid as *ad-interim* dividend at the rate of Rs. 12 per share free of income-tax of Rs. 5,40,000 is deducted, leaving a balance available for disposal of Rs. 13,11,283. From this sum the Directors recommend the following allocations:—Payment of a final dividend at the rate of Rs. 11 per share free of income-tax Rs. 4,95,000, payment of a bonus at the rate of Rs. 5 per share free of income-tax Rs. 2,25,000, equalization of dividend account Rs. 2,00,000, employees' pension and gratuity account Rs. 2,00,000, leaving to be carried forward to next year's accounts Rs. 1,91,283.

The Directors have, as in the previous year, placed a sum of Rs. 2,50,000 to Special Depreciation.

Out of the amount of Rs. 30,00,000 invested in Defence Loan 1953/55 and standing in the joint names of the company and the Secretary, Finance Department, a sum of Rs. 3,00,000 was released by the Government of India to pay for new machinery which was delivered during the years 1943 and 1944.

Various alterations and additions to the mill buildings including a new creche were carried out during the year at a cost of Rs. 54,085. The Directors have secured at a cost of Rs. 4,14,747 a piece of land measuring 13,817 square yards, between Katrak Road and the western boundary of No. 2 Mill, together with the buildings situated thereon.

Machinery to the value of Rs. 1,70,552 was received and erected during the year. The amount paid to mill employees as dearness allowance during the year was Rs. 33,32,325. In addition an amount of Rs. 7,12,518 has been set aside to be paid as bonus for the year 1944.

The mill property as at 31st December 1944 was insured against loss by fire and all risks arising out of riots and civil commotion for the following amounts:— Buildings Rs. 47,17,100, machinery Rs. 1,22,67,800 and stocks Rs. 1,48,02,200.

The profits and fixed charges have been insured against a stoppage by fire for Rs. 2,32,00,000. Under the Government of India War Risks Insurance Ordinance, the mill stocks were covered for a sum of Rs. 1,46,00,000 and the mill buildings and machinery were covered for a sum of Rs. 1,87,78,000 as at 31st December 1944.

Commercial and Technical Organizations

(*Concluded from page* 424)

In any case it was felt that the policy of the Agricultural Department to encourage the growth of M4 to the exclusion of every other variety throughout Sind might prove dangerous.

Woollen Piecegoods: Margins allowed for Importers.—Price Control Notification No. 1/2(29)/44-CG(CS) fixed the margins for wholesalers and retailers only and the importer was treated as a wholesaler or a retailer according to how he sold the goods. Therefore, if the importer's buyer was a wholesaler he would have to share with the latter the difference between the landed cost and the wholesale ceiling price or the wholesaler's margin of 10 per cent. as per note 1 of the notification. Thus the importer would in most cases have to be satisfied with a margin of about 5 per cent. which was insufficient under existing conditions for the following reasons:—This business mostly had to be done on description, as samples were not always available; deliveries/shipments were very uncertain and goods might arrive out of season and might have to be stored; storage involved additional risks (damage by insects) as the goods were no longer packed in tin-lined cases. This risk was enhanced by the delays caused in complying with lengthy control formalities; greatly reduced turnover as compared with normal times and greatly increased overhead expenses.

There was justification in asking that in this respect both cotton goods and woollen goods should be treated in the same manner, because conditions before the war were also alike.

NEWS OF THE MONTH

Indian

The Punjab Institute of Textile Technology.—The name of the Government Central Weaving Institute at Amritsar has recently been changed to the Punjab Institute of Textile Technology. The present Principal is Mr. N. Banerji.

Bombay Working Class Cost of Living Index.—In January the working class cost of living index number for Bombay with the average prices for the year ended June 1934 equal to 100, was 229. This was seven points lower than in the preceding month. The index number for food articles declined by 13 points to 254.

Morarjee Goculdas Mills Declare Interim Dividend.—At a meeting of the Board of Directors of the Morarjee Goculdas Spinning and Weaving Co., Ltd., Bombay, held on 13th February, 1945, it was resolved to pay an *ad interim* dividend at Rs. 12 per share for six months ended 31st December 1944 and it will be paid on and from 2nd April 1945.

Madras Labour Dispute Referred for Adjudication.—The Madras Government have directed that the trade dispute between the management of the Buckingham and Carnatic Co., Madras, and their workers be referred to Rao Bahadur M. Venkataramayya, retired District Judge, for adjudication. Mr. M. Venkataramayya will make a preliminary inquiry into the nature of the dispute and make a report to the Government as to the matters on which he considers adjudication advisable.

Radio Owners and Repairs.—The Joint Honorary Secretary, All India Radio Merchants' Association, Bombay, writes that in accordance with the latest Government Order (Posts and Telegraphs), it is obligatory on the part of every radio owner taking his radio for repairs to a radio dealer to show his wireless licence to the dealer, as the dealer is required to maintain a register showing licence number and date of expiry for the inspection of the Posts and Telegraphs Department. The dealer is not permitted to return the radio to the owner unless the above information is furnished. The public is generally not quite aware of this new Order and it is hoped that this will enlighten the radio owners about the position.

Textile Calendar

MARCH

1st, Thursday :
Second All-India Textile Conference, Bombay.

3rd, Saturday :
Federation of Indian Chambers of Commerce and Industry, Annual General Meeting, New Delhi.

16th, Friday :
Bombay Presidency Trades' Association, Ltd., Annual General Meeting, Bombay.

29th, Thursday :
The Textile Stores and Machinery Merchants' Association, Bombay Presidency, Annual General Meeting, Bombay.

APRIL

10th, Tuesday :
Textile Control Board Meets in Bombay.

11th, Wednesday :
The Millowners' Association, Bombay, Annual General Meeting.

12th and 13th, Thursday and Friday :
Federation of Piecegoods and Yarn Merchants' Associations of India, Bombay, First Annual General Meeting.

Board of Studies in Textile Technology, University of Travancore.—The following is the list of members of the Board of Studies in Textile Technology, Trivandrum, which has been reconstituted for a period of three years from 4th February 1945:—

Mr. M. P. G. Nair, T.T.W.Fm (Saxony). Spin. Tech. (Bohemia), Principal, Institute of Textile Technology, Trivandrum (*Chairman*); Dr. D. L. Deshpande, B.Sc. (Hons.), M.Sc.Eng. (Manc.), Ph.D., A.M.C.T., A.M.I.Mech.E., M.I.E., Principal, College of Engineering and Dean of the Faculty of Technology, University of Travancore; Captain K. Kylas, Professor, Institute of Textile Technology, Trivandrum; Messrs. B. K. Murthy, B.E.Mech. M.Sc.Tech. (Manc.), A.M.C.T., Director of Textiles, Mysore; V. G. Nair, B.A., M.Sc.

Tech., A.M.C.T., F.C.S., Technical Chemist, Parapanagadi; T. Logie, of A & F. Harvey Mills Ltd., Ambasamudram; and Dowlet Ram Tawker, Manager, A. D. Cotton Mills Ltd., Quilon; Dr. A. N. Potti, M.A., Ph.D., Professor, University College, Trivandrum, and Mr. A. G. Pandit, Manager, the Travancore Rubber Works, Trivandrum.

New Strain of Cotton Evolved at Surat.—The Annual Report of the Department of Agriculture, Bombay, for 1942-43, says that botancial research work, designed to increase the outturn and quality of the crops, was carried on at a number of Government farms and research stations throughout the districts. Considerable success was achieved in the evolution of improved varieties of cotton, wheat, etc. An improved strain of cotton evolved at Surat Government Farm may shortly replace 1027 ALF as the standard improved cotton for the Surat tract. The " Vijay " strain of cotton evolved in Gujarat has been fully tested and an organized seed multiplication and distribution scheme is being subsidized by the Indian Central Cotton Committee, and promising strains have been obtained at other centres.

Ahmedabad Textile Dispute Not Settled.—The Ahmedabad Millowners' Association and the Labour Association have disagreed on the question of grant of bonus to mill workers in Ahmedabad. An announcement to this effect was made when the Chief Conciliator met representatives of the two bodies on 24th February 1945.

A Press message says: Mr. Gulzarilal Nanda, Labour Secretary, stated in an interview: " As no agreement has been reached we are going to ask the millowners to put the bonus issue before arbitration once again. As there is a cloth famine in Bengal and other parts of the country, we do not want to increase the hardship of the people by any of our actions. Our effort is to leave no stone unturned to secure arbitration and we are going to take immediate steps to secure it."

Imports of Cotton Ropes, Tapes and Bandings.—In reply to a communication addressed to Government on the above subject, the Indian Merchants' Chamber, Bombay, have been informed that the import of these materials was necessary and that the import quota of these materials, which formerly stood at 5,500 cwts., had been reduced to 3,000 cwts. The Chamber in a further communication dated 19th January reiterated their contention that the import of these articles was not necessary as, in their opinion, the indigenous production was sufficient to meet the requirements of the textile industry. Government in their letter dated 25th January remarked that after careful inquiries from the mill industry they found that Indian-made ropes, etc., were not suitable for certain purposes and, therefore, the authorities were not prepared to reduce the import quota below 3,000 cwts., as suggested.

Unsatisfactory Marking and Packing of Goods Exported from India to East Africa.—It has been reported to the Indian Government Trade Commissioner, Mombasa, by the Port Authorities in East Africa that they are experiencing considerable difficulty and inconvenience in dealing with claims in respect of baled cargo from Indian ports, especially Bombay. One of the contributory causes seems to be the use of second-hand coverings on bales showing numerous and varying marks resulting in confusion in tallies and deliveries. It is, therefore, suggested that bales and packages should have new coverings bearing clear and distinctive marks. It is needless to emphasize that the practices complained of, if continued, are likely to have serious consequences for India's export trade with East Africa, and exporters to that country are strongly advised in their own interests to take all possible steps to remedy these defects without delay.

. Dr. Nazir Ahmad at New Orleans : Indian Cotton Prospects.—Dr. Nazir Ahmad, Indian cotton technologist, while at New Orleans, U.S.A., predicted greater cotton production in India by increased use of fertilizers and by modern methods of farming. He said that India would buy large quantities of fertilizers from America.

Interviewed during a tour of the Agricultural Department's cottton research laboratories there, Dr. Ahmad expressed the belief that " Indian cotton will compete far less with the American crop because the proposed 15-year Indian reconstruction programme calls for greater home consumption of Indian products. This 15-year programme, estimated to cost 3,000,000,000 dollars, promises to be a boon to American commerce, industry and agriculture."

Dr. Ahmad said that improvement of the lot of the Indian farmer—one of the objectives of the programme—would eliminate a contributing factor in cheap competition in the world cotton markets.

Fined for Profiteering in Cloth.—The manager of the Piecegoods Department and the salesman of Messrs. Ralli Brothers Ltd., Bombay, who were charged under the Hoarding and Profiteering Prevention Ordinance for selling 1,780½ yards of cloth at Rs. 2-15 per yard, when the landed cost of the same per yard was only As. 14, were recently sentenced by Mr. V. K. Muranjan at the Mazagon Police Court and fined Rs. 1,000, Rs. 200, and Rs. 100 respectively. In default of fine, the first two accused were sentenced to two weeks' simple imprisonment.

In passing sentence, the Magistrate thought that a fine would meet the ends of justice as the case was not one of deliberate contravention of the law. The sale, the Magistrate thought, was done on the *bona fide* belief that the provision of the Cotton Cloth and Yarn Control Order applied to cotton textiles, while the Hoarding and Profiteering Prevention Ordinance did not apply. The Press notes and notifications regarding this, the Magistrate thought, would lead any layman to the same belief. Thus, even though motives of greed and anti-social conduct could not be suggested against the accused, the Magistrate held that in assessing the fine the unauthorized profit made by the Company should be considered.

Technical Training Abroad : India Government's Scheme.—The Central Government, New Delhi, have requested Provincial Governments, chambers of commerce and employers' organizations in India to expedite their recommendations regarding candidates who are to be sent to the U. K. and the U.S.A. for higher technical training. It is pointed out that the Government of India have decided to send the first batch to the U.K. so as to reach there not later than June 1945.

Candidates required for training abroad, under this scheme, will be persons possessing a university degree in science or engineering or equivalent diploma and at least three years' industrial experience in India. The duration of training will be about a year, but in special cases it may be extended up to two years. The trainees will be required to take refresher courses in theory, but industrial experience in factories and workshops abroad, of the kind on which they will be employed in India, will constitute the most important part of the training.

Among the trades for which the Government of India contemplate providing training facilities are: mechanical engineering, electrical engineering, radio engineering, aeronautical engineering, shipbuilding, marine engineering, civil engineering, structural engineering, metallurgy, generation of electricity, locomotive construction, chemical engineering, fertilizers, plastics, glass and steel manufacture.

Institute of Textile Technology, Travancore : Annual Day Celebrations.—The Annual Day of the Institute of Textile Technology of the Travancore University was conducted on the 23rd February 1945 under the presidentship of Rao Sahib L. Venkitakrishna Iyer, B.A., B.E., I.S.E., the Chief Engineer of the Travancore State.

The final meet of the sports were held in the morning and the public meeting was conducted at 6 p.m. after the social at 5 o'clock.

The Principal of the Institute, Mr. M. P. G. Nair, T.T.W.Fm. (Saxony), Spin. Tech. (Bohemia), welcomed the gathering and in his annual report mentioned the difficulties he has had to encounter in the procurement of machinery and other appliances due to the present war conditions. He paid a tribute to the members of the staff who were actually devoting their leisure and useful hours in the pursuit of industrial research. In this connection, he mentioned the worthy contributions of Captain K. Kylas and Mr. T. V. Punnoose as well as the problems taken up by Messrs. G. S. Ramakrishnan, H. N. Sarma and K. M. Mathew. The main principle in the research scheme is mostly the application of science in the cause of industry. In the matter of sports and games and in the matter of examination results, the progress of the Institute was very encouraging, observed the Principal.

There was a fancy dress competition as well as music and dance which was highly appreciated.

Technological Institute : Central Government's Proposal.—In order to ensure an adequate supply of technical personnel to meet the demands of the administrative services and industrial development in the country in the post-war period, the Government of India, says a Press note, have appointed a committee, with Mr. N. R. Sarker as its Chairman, to consider the establishment of a high-grade technological institute in India, possibly on the lines of the Massachusetts Institute of Technology, to provide advanced instruction and training in technology.

The committee will consider and make recommendations to the Government of India regarding the scope and size of the proposed institute, the site of the institute, its control and management, recruitment and conditions of service of its teachers, the cost involved and other relevant questions relating to the establishment of such an institute and its future development.

The following have been invited to serve on the committee:—Mr. N. R. Sarker (*Chairman*), Mr. A. D. Shroff, Mr. W. W. Wood, Sir J. C. Ghosh, Dr. Nazir Ahmad, Mr. C. E. Preston, Mr. W. W. Ladden, Mr. M. D. Parekh, Sir S. S. Bhatnagar, Mr. J. K. Srivastava, Mr. G. I. Mehta, Sir Sobha Singh, Major-General D. R. Duguid, Brigadier R. D. T. Woolfe, Mr. W. G. W. Reid, Sir Frederick Tymms, Mr. P. J. Edmonds, Mr. H. V. R. Iengar, Dr. A. H. Pandya, Mr. S. Lall, Mr. Dharma Vira and Mr. John Sargent (members).

Training Indian Labour Officers in Britain : Government Scheme.—Arrangements are being made to send the first batch of trainees, under the scheme for training labour officers in the United Kingdom. It is proposed to send three batches, each consisting of 20 officers of the Central and Provincial Governments.

This training scheme will provide the personnel necessary for labour administration in the post-war period. Owing to the importance of war production and the necessity for rapid industrial expansion labour problems have come into greater prominence in India during the present war, and further important developments are inevitable in the post-war period.

Labour policy in India is moulded on the experience and practice of other more highly industrialized countries, and it is necessary to have a trained and experienced staff for labour administration. Officers of the Labour Departments of the Central and Provincial Governments, who will be sent for training under this scheme, will return with knowledge of certain aspects of labour administration which are of immediate importance, for example, industrial relations including the settlement of labour disputes, factory inspection and labour welfare, wage regulation and inspection, employment exchanges, demobilization and resettlement, welfare and dock labour and port registration schemes.

The course in the United Kingdom, theoretical as well as practical, will take six months and, in special cases, may be extended to eight months. The training will be divided into two parts: training at the headquarters of the Ministry of Labour and National Service, and training in the regions. At the headquarters, the training will be theoretical and elementary dealing mainly with the underlying principles of policy and procedure and with the organization and functions of the Ministry of Labour and National Service. Training in the regions will be more detailed and practical.

In view of the contemplated expansion of the machinery of employment exchanges, a large number of officers will be specially trained in this subject.

Foreign

Large-scale Cotton Textile Enterprise in South Africa.—During the past three years, plans have been prepared by consultants of industrial development, including an English expert, for the establishment on an economic basis of a large cotton textile enterprise in South Africa. The enterprise envisages the establishment of a plant of some 60,000 spinning spindles and 2,000 looms to produce between 50 and 60 million yards of cloth yearly and will provide direct employment for about 3,500 employees.

E. African and Sudan Cottons.—The negotiations between the Government of India and the East African and Sudan Governments announced in the Government of India Press *communique* dated 23rd October 1944, have now been finally concluded, says a Press *communique*.

The 1944-45 crops of East African and Sudan cottons suitable for consumption in India will be sold to India at Rs. 850 per candy Bombay dock delivery new mill terms for East African B P 52 and at corresponding prices for other varieties.

Textile Production in Central Siberia.—The first cotton textile mill ever seen east of the Urals was erected about 10 years ago in Barnaul, in Central Siberia. Raw cotton was readily available and the plant progressed rapidly. Recent reports indicate that from June 1941, until August of this year, more than 100,000,000 metres of cloth were woven in that plant. A second weaving factory has now been placed in operation.

Flax cultivation was introduced into that area somewhat later, and the flax is being converted into linen in a new weaving plant in Barnaul.

Cotton Firms Should Turn to Rayon : Sir Raymond Streat's Advice.—Sir Raymond Streat, Chairman of the British Cotton Board, put forward a strong plea for cotton firms turning to rayon in his Liverpool speech on 26th February. He said that a big and rapid expansion in rayons can only come that way, and added that the competitive cotton position after the war for a year or two, when world-wide shortages have to be made good, will not appreciably be affected by these other developments. But, on a longer view, substantial changes may emerge. Improved varieties of cotton would have to be grown.

Priority to Home Orders: British Machinery Makers' Assurance.—The *Cotton Board Trade Letter* states that in discussions with the Chairman of the Cotton Board, machinery makers expressed willingness to give reasonable general priority to home orders and the reconditioning of existing machinery and gave assurances about their price policy. Makers of spinning and weaving machinery did not seek protection against imports of foreign machinery, but makers of winding machinery took the view that they should receive the same degree of protection against foreign competition as they received in 1939.

Textile Machinery Imports into India.—We are indebted to the *Trade and Engineering* Section of *The Times* for a summary and aggregate of the imports of textile machinery into India for the five years ended March, 1938, says the *Textile Recorder*. From this it would appear that aggregated imports were valued at Rs. 165,000,000, and that of this the U.K. was responsible for no less than Rs. 135,000,000. With the exception of certain requirements for the leather industry, the U.K. always took the lead, and this was particularly marked in cotton spinning machinery, in which category only one-seventh came from any other source.

Tariff Control to Help British Exports.—The abandonment or a drastic reduction of the most-favoured-nation clause in international trade was urged on 19th February by the Secretary of State for India, Mr. Amery. " We must give effective priority to purchases from the sterling area as well as to our exports to that area," Mr. Amery said, adding that after the war Britain would no longer be able to live on " theories and assumptions which may have held good in the economic world of the nineteenth century. "

Mr. Amery urged control by tariff, adding: " It will be one of Government's first duties to conclude trade treaties to help our exporters. "

Rumours about Platt Bros. Leaving Oldham Denied.—Rumours about the world-famous textile machinists' firm of Platt Bros. leaving Oldham caused some disquiet in that town. Sites at Squires Gate, Blackpool, and other places had been mentioned, and in order to ascertain the true position a deputation from the Oldham Town Council recently waited on Sir Walter Preston, Chairman of the company, when they were reassured that no transfer of these vast works, which have made Oldham's name known throughout the world, is contemplated.

It is known that the firm have a vast export and home programme to fulfil as soon as conditions allow, and it may be necessary to set up a kind of shadow factory to cope with the business.

Improved Strain of Peruvian Tanguis Cotton.—A big improvement in the strain of Peruvian Tanguis cotton is reported by the *South American Journal*. After much research by the Institute of Cotton Genetics in Peru, a new seed is being distributed to cotton estates, for which six important claims are made. These are: That it increases the staple of the cotton from $1\frac{3}{16}$in. to $1\frac{3}{8}$in.: that it increases the ginning yield by 37 to 40 per cent.: that it increases the size of the boll, thereby facilitating picking: that it eliminates all colour types: that it preserves the essential texture of Tanguis, maintaining the degree of coarseness which is preferred for certain types of hosiery and underwear, especially in mixtures with wool: and that it increases the yield per acre.

Jute Production in Brazil.—The official publication, *Agriculture in the Americas*, says that Brazil which used to import most of its jute from India lately has been so successful in cultivating fibre at home that "substantial amounts are being produced and increasing quantities of jute products are being exported to the United States."

Whereas in India jute is so cheaply produced that the medium grade sells in New York wholesale market at 4 to 4½ cents per pound, the publication said, it costs 3 to 4 cents to produce jute in Brazil and the "consumer must pay considerably more than this" because of the expense of transportation. Transportation to mills often costs as much as it does to produce jute in Brazil.

"Increased production of jute is one of the most interesting developments that have taken place in Brazil in recent years. Originally Brazil imported most of its jute from India but importation of fibre has been curtailed owing to the war."

Brazil's jute, like that of India, is of the roundpod variety. Two crops may be produced annually, the first harvest being between March and June and the second between October and November. The publication said, Government loans are available to independent growers.

International Cotton Committee Meeting: India's Representatives.—The United States State Department has announced that the International Cotton Advisory Committee established in September 1939 to study and report on problems in the world's cotton industry will open its 4th meeting in Washington in the first week of April. In addition to the United States the countries which are members of this Committee and which are expected to send delegates are Brazil, Egypt, India, Peru, Mexico, Turkey, Anglo-Egyptian Sudan, the Union of Soviet Socialist Republics and British and French cotton exporting colonies. The primary objectives of the discussions will be a survey of various aspects of the world cotton situation, especially problems affecting international trade in that commodity and the formulation of recommendations for subsequent consideration by individual countries for the solution of such problems. The Director of the Office of Foreign Agricultural Relations, U. S. Department of Agriculture, Mr. Leslie Wheeler, is Chairman of the Committee and will preside at the opening session.

In this meeting the Government of India would be represented by the Trade Commissioner in New York and by the Controller of Raw Materials and Stores in the Textile Commissioner's Office.

Fifty Years Ago

(From the *Indian Textile Journal*, March 1895)

Textile Club for Bombay

"In Bombay a textile club is being formed and already over 50 members have been enrolled. A committee has been appointed to select suitable premises and one of several available bungalows in the neighbourhood of Parel or Chinchpoogly will probably be selected. . . . It is proposed to enter into negotiations for affiliation with clubs similarly constituted in England, so that members of clubs in either country shall, on payment of the monthly subscription, be entitled to all the privileges of the affiliated club without going through the usual formalities. . . .

"Inaugurated with so much enterprise and enthusiasm by all sections of the European mill community, these textile clubs possess all the elements of a long and harmonious career."

EDITORIAL

India and U.N.R.R.A.

THE Government of India have appointed Mr. Kasturbhai Lalbhai as India's representative on the Textile Committee of the Combined Production and Resources Board of the United Nations Relief and Rehabilitation Administration; the United Kingdom and the United States of America are the other countries participating in its deliberations. India was hitherto represented by Whitehall, although it occupies the second place among cotton textile manufacturing and exporting countries. It is something, therefore, that Government should have since seen the desirability of separate representation for it.

The aim of the Textile Committee is to make comprehensive surveys of war-time and post-war textile requirements of the world in relation to the productive capacity of the different manufacturing countries. The findings of the Committee are to be periodically submitted to the Board with its recommendations as to what part each country should be asked to play towards meeting the general requirements. In the first half of 1944, the United Kingdom, the United States of America and India allocated about 10.7 per cent. of their aggregate production for export purposes; it worked out at 490 million yards or 9 per cent. of production for the United States, 250 million yards or 25 per cent. of production for the United Kingdom, and 280 million yards or 9 per cent. of production for India. It is believed that according to present allocations all Indian and British supplies have been allocated to the eastern hemisphere.

Cotton goods are a vital military necessity to satisfy the minimum civilian needs of Australia, Latin America, Africa and the Middle East countries, which are serving as bases for military operations or supplying men, munitions, or essential raw materials for the conduct of the war. But it has been authoritatively estimated that nearly 50 per cent. of the world's productive capacity will have been damaged before the war is over and England, America and India may have to pool their resources and formulate plans for some kind of international rationing or zoning of export markets. No doubt countries in Europe like France and Belgium have been liberated, but it is feared that it will take a long time for them to be in a position to supplement Allied production for war purposes; until then they may continue to require supplies from England. On the other hand, as China and other Far Eastern countries are being cleared of the enemy, there will arise an enormous demand for cotton textiles to be met by the Allies, particularly because of the possibility that Japanese textile plant may emerge from the war in a condition that may not permit it to engage in export trade on the same level as it reached seven or eight years ago.

So far as India's cotton textile exports are concerned, Mr. Kasturbhai Lalbhai declared the other day that it would be wise for India to "select such *natural* markets as could be advantageously served and maintained for a long time to come, instead of clinging to unnatural markets which had been thrust on the country owing to the exigencies of war." India's "natural" markets are represented by countries bordering on the Indian Ocean and include Ceylon, Burma, Malaya, Australia, the East African littorals and the Middle East group, which last consists of Egypt, Turkey, Iraq, Iran, Saudi Arabia, Palestine, Syria and Lebanon. It is worthy of note that in several of these countries the urge for self-sufficiency has been gradually developing and considerable progress has already been made in the growing of cotton and/or the establishment of the cotton textile manufacturing industry, as, for example, in Egypt, East Africa, Ceylon and Australia. The countries of the Middle East, on the other hand, are predominantly agricultural and their raw material exporting economy is complementary to the economy of the highly industrialized countries of Western Europe and their foreign trade is, therefore, canalized in that direction.

About Dhotis and Saris

As in the matter of foodstuffs, so also in the matter of clothing, rationing of a kind has at last had to be resorted to. The province whose administration of textile control was attended with the greatest degree of success has, naturally, set the pace, and since 21st March 1945 *dhotis* and *saris* are being rationed in Bombay City and suburbs.

Under the Bombay scheme, a person has a reasonable chance of obtaining a pair of *dhotis* and a pair of *saris* every six months from any one of the approved cloth shops. We say "reasonable chance" advisedly, because the scheme does not guarantee supply but only aims at "controlled distribution of available supplies"; guaranteed supply should be possible with the introduction of full rationing in the immediate future. The six-month period may be reduced to four if the supply situation warrants it, and the scheme, we are informed, may soon be extended to cover mulls and voiles; but it does not apply to handloom *saris* and *dhotis* which will be available as hitherto at controlled rates. It was reported that statistics of persons habitually using *dhotis* and *saris* were being collected by the Provincial Textile Controller's Office and the Provincial Controller himself has, in the meanwhile, issued an appeal that people who are not habitual users of *dhotis* and *saris* should abstain from using their ration cards for the purpose.

While the Bombay experiment is being watched with interest, it is useful to bear in mind that the adoption of country-wide rationing of cloth depends for its success on a thorough reduction in the number of varieties at present being produced. It is clear that they should be brought under manageable proportions. And, similarly, if controlled distribution is to be attended with hundred per cent. success, the problem of all-India supervision needs to be squarely faced. The point was raised in the latest session of the Central Assembly by several speakers. The representative of the Millowners' Association, Bombay, emphasized that, constitutional difficulties notwithstanding, the Textile Commissioner should be armed with adequate power to supervise the enforcement of control measures with uniform efficiency throughout the country. We wonder why no official assurance has been forthcoming on this point.

"Relief" Supplies from Lancashire ?

INDIAN cotton mill production has now risen to 4,800 million yards and handloom production amounts to 1,500 million yards. Out of this, however, exports account for 600 million yards and Defence requirements for 850 million yards, leaving only about 4,800 million yards for internal civilian consumption. To increase production further is not impossible, but that means increased coal supply, increased supplies of textile accessories and stores, multiple shift working and the recruitment of additional labour, standardization or rationalization of production, and, finally, tax reliefs for machinery replacements and renewals. If these factors were tackled successfully, it is believed, by trade union leaders among others, that Indian mill production could be stepped up very considerably. But the Hydari Mission, which recently returned from England, has found another, and less generally acceptable, solution to this problem of shortage. By the arrangement which it has negotiated with His Majesty's Government, the Indian cotton textile supply situation is to be eased to the extent of 600 million yards in 1946. This saving is to be made good by reducing exports and Defence requirements by 200 million yards each and increasing production by 200 million yards with the aid of mill stores and accessories which His Majesty's Government have arranged to supply India with. The deficiency in the Defence requirements is to be made good by the United Kingdom, which may mean exports to India of 200 million yards or more. Why, it is asked, should not Indian productive capacity be left free to cope with the whole internal civilian and Defence demands, and to cater to such of the export markets as India chooses in the light of its own requirements ?

The Adarkar Plan of Health Insurance

The Problem of Its Statistical Basis

By A. N. AGARWALA, M.A., *University of Allahabad*

(*Specially Contributed*)

PROFESSOR B. P. Adarkar's Scheme of Health Insurance for Industrial Workers of India has been criticized in certain quarters on the ground that it is not based on an adequate volume of reliable and representative statistics regarding sickness; and consequently the contribution-benefit structure erected in it is suspect if not actually unsound. Now, it is quite true that in this land of permanent statistical famine, morbidity statistics are conspicuous by their absence. Prof. Adarkar is to be regarded as a pioneer in collecting such morbidity statistics as are in existence in this country, which have been published by him in the shape of some very useful appendices to his valuable report. But a glance at these statistics would show that they are unfit for affording a basis on which a sickness insurance scheme could be built up with certainty and confidence. They exhibit great variations which are almost shocking. We give below a list of selected statistics collected by Prof. Adarkar, which are very revealing:—

INCIDENCE OF SICKNESS IN

Textile industry		Engineering industry		Minerals and metals	
Lyallpur Cotton	1.68	Addison	0.69	Tata Iron, Sigua	3.56
Lakhmiratan	2.04	Tata Hydral	1.22	Tata Iron, Malkra	5.36
Delhi Cloth	4.93	East India	2.70	Indian Copper, Moubhander	6.69
Buckingham	5.84	Math. Instr.	4.18	Tinplate Co.	9.29
Cambodia	7.15	Rifle Factory:—		Assam Oil	10.9
Rajalakshmi	9.28	Ishapur	7.30	Indian Copper, Mosabomi	10.94
Motilal Agarwal	11.41	Jubbulpure	10.43		
Pandyan	12.1				
Madura	13.1				
Tuticorin	14.0				
Ambasamudram	14.6				

The range of variation in the case of all the industries to which the scheme is to be applied in the first instance is so great as to make one pass a *prima facie* judgment against their use as a basis of a health insurance scheme. They suffer from several technical defects. The aggregate volume of statistics that are available in the country and have been collected by Prof. Adarkar is extremely inadequate, and, in spite of the great thoroughness and carefulness with which he has accomplished this difficult task, it would be unpardonable to raise the superstructure of a health insurance scheme entirely and exclusively on them. The universe is too narrow to allow the law of averages to work itself out. Besides this, these statistics have a certain degree of non-comparability. They relate to the sickness schemes which some companies have in force, but they use the term "sickness" in varying senses, and the terms and conditions under which sickness benefits are granted are also not identical. The Vaidyanathan Actuarial Committee observed that " the chief drawback of the statistics is that the companies had not been keeping their books in such a way as to enable rates of sickness to be calculated on a uniform definition of the term ' sickness.' Some have, therefore, returned all periods of sickness, whether or not sick benefits were paid, while others have returned only periods of sickness for which benefits were paid." Besides this, there is the vital problem of the representative character of these statistics, which is highly doubtful. The undertakings furnishing these figures do not have the representative character bestowed upon them by random sampling or even deliberately, and consequently they cannot be fully relied upon without the fear of indulging in a fallacy of false generalisation. Finally, these statistics are generally vitiated by deliberate errors committed on the side of moderation. It is common knowledge and a frequent allegation of labour leaders that factory doctors are not fair in certifying the existence of sickness and the number of sick persons declared sick has to closely conform to the number of persons which the factory can or would like to spare at any particular time. Indeed, in many cases the workers who have been refused sickness leave and benefits on the certification of fitness for work by the factory doctor were later found to meet their death just outside the factory gates! The wide divergences in the incidence of sickness from mill to mill is in itself a sufficient indication of an element of deliberate control of sickness incidence.

Sickness benefits are granted in some of the Government undertakings as well and it would have been worth while scanning these statistics, for there is a likelihood of their being free from the element of deliberate error of the type pointed out above. They do not appear to have been made available to Prof. Adarkar and one rather misses their presence. However, even they could not have given any definitely correct idea regarding sickness rate because Government undertakings take only selected workers who are medically and physically fit and otherwise alert and healthy. These better-class workers cannot represent the morbidity rate of an average type.

Prof. Adarkar is as alive to these defects in the statistics as any expert can be, and that is the reason why he has not based his scheme on their foundation but has collected and presented them, for what they are worth, if for nothing else than for showing that it would be erroneous to build up a scheme on them. Consequently, those who criticize his plan on the ground that it is based on defective statistics fail to appreciate the role of the published morbidity statistics in the actual construction of his plan. Prof. Adarkar would be second to none in condemning these statistics and he would readily agree that the available morbidity statistics are not only not of a nature which can serve as a basis for the framing of a scheme but are definitely misleading. Their wide variations render them entirely unusable in any scientific treatment. The fact, therefore, is not this, that they have been still used for deciding the rate of contributions by Prof. Adarkar; but this, that they have been discarded by him as being unreliable and worthless. That, indeed, in a sense is the strong point of the scheme.

But if this scheme is not based on the available Indian morbidity statistics, what are the statistics that form its basis? Is it not an axiom that a sickness insurance scheme must be rooted in actual morbidity statistics in order to be reliable and accurate? These are the logical questions which arise at this stage. Now, it is well known that the quotation of the price of insurance cover in advance on the strength of anticipated cost is the central feature of modern insurance as distinguished from life insurance assessments of olden times. The forecast of cost is indispensable in all types of insurance but in the domain of social insurance in general it has to be done with extraordinary care and caution for the reasons that, (i) whereas in life and property insurances the premium rates charged by competing and old-established concerns are a reliable guide, no such guidance is available in the matter of social insurance in the countries which seek to establish this system of coverage for the first time, and (ii) whereas in life and property insurances premium rates can be changed with respect to fresh subjects from time to time as found necessary, in social insurance the insured group is generally not of such a mental level as to acclimatize itself to changes swiftly and smoothly. On the contrary, such changes may disturb and upset many of them for a considerably long time. It is, therefore, clear that the importance of the statistical basis of a health insurance scheme can by no chance be exaggerated.

Foreign Morbidity Statistics Used?

If that is so and if Prof. Adarkar does not use the available Indian statistics relating to morbidity, does he use foreign statistics for this purpose? No, he does not do that either. In fact, he avoids them as much as the statistics he has himself assiduously and carefully collected, for a variety of reasons which we can ourselves think out. Firstly, while in life insurance international statistics can be easily used with necessary loading in sub-tropical countries like ours, it is difficult to place such complete reliance on foreign statistics in the matter of health insurance, for morbidity statistics are dependent on a number of complex factors which are not identical everywhere. Secondly, the term " sickness " is not used in the same sense everywhere and terms and conditions of benefits are also different. This further impairs the value of foreign morbidity statistics. Then, again, foreign statistics are available in age-groups and might not be altogether useful to a system which cuts out all age categorisations. Even if weighting is resorted to, the average may not still be utilizable because there is no guarantee that age-grouping in India will be identical in its spread as in foreign countries. As a matter of fact, the idea that foreign statistics can be used as a basis for the purpose under discussion requires early revision. The International Labour Office a few years ago observed: " In no branch of labour statistics are differences in the scope and nature of statistics so evident as in that of industrial accidents and in no branch are international statistical comparisons more difficult." The 11th International Congress of Actuaries which met in Paris in July 1937 also came to the same conclusion. What is true of industrial accident statistics is very much likely to be true of industrial morbidity statistics as well, and too much reliance cannot be placed on them for evolving a basis of sickness insurance scheme for this country.

The only usefulness of international morbidity statistics is that they exhibit, in their movements and variations, certain broad and general tendencies which are of great value. For instance, they definitely establish, as has been repeatedly pointed out by Mr. J. H. Thomas, the former Superintendent of Insurance in this country, Prof. Adarkar and the Vaidyanathan Actuarial Committee, that morbidity rate tends to shoot up immediately after the introduction of a health insurance scheme, which may be ascribed to the abnormal malingering tendency in the earlier stages of the scheme, mistakes likely to be committed by the Fund's officials, lack of full control and supervision and the like. They further show that no scheme can permanently commit itself to the statistics on which it is originally based, for the introduction of an actual scheme brings into existence a set of factors for the first time and the behaviour of statistics in this set-up can by no effort be divined before its actual operation.

Prof. Adarkar, however, says that " Morbidity data collected in other countries have some value as a guide, especially as indicating the lower limits for Indian experience, which must be admittedly higher than the experience of Western countries " (page 21). Now, it is only to be expected that the Indian experience would be higher than the experience in Western countries: but we are not certain that it can be satisfactorily established, on statistical or some other definite grounds, that the Western experience will indicate the lowest level which the Indian experience would touch. Nor does Prof. Adarkar explain how that indication can be traced. In any case, what we want to ascertain is the average rate of morbidity that may be experienced in this country, and not the lowest rate. As a matter of fact, an idea as to the highest rate would be much more useful than an idea regarding the lowest point: and this is what foreign statistics cannot perhaps furnish. We are, therefore, not certain what actual purpose the foreign morbidity statistics have served in the framing of this report. Perhaps none, except giving a very rough idea of the expected morbidity and showing the behaviour of statistics immediately after the introduction of the scheme and later. They are not capable of being more useful than that; and we are glad that Prof. Adarkar himself lets them go at that and the Actuarial Committee does not even touch them.

The unfortunate position to-day is that we have neither reliable morbidity statistics nor a sickness insurance scheme. We cannot satisfactorily frame a scheme without statistics of this type. But we cannot collect these statistics without the framework of an actual scheme ! As the author of this report correctly observes: " Sickness statistics are, mathematically speaking, a ' function ' of the definition of sickness and the rules and regulations regarding benefits under a scheme. In these circumstances, to insist on correct morbidity statistics as a condition precedent to the introduction of a scheme would be illogical." It is thus very much a hen-and-egg puzzle. It is a vicious circle and had to be broken at one point or the other.
